</tbody>
</table>
This document is intended to help you set up the software development environment for the hardware based on the ESP32 chip by Espressif.

After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then building, and flashing firmware onto an ESP32 board.

Note: This is documentation for stable version v4.1 of ESP-IDF. Other ESP-IDF Versions are also available.

1.1 Introduction

ESP32 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth 4.2
- Dual high performance cores
- Ultra Low Power co-processor
- Several peripherals

Powered by 40 nm technology, ESP32 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.
1.2 What You Need

Hardware:

- An ESP32 board
- USB cable - USB A / micro USB B
- Computer running Windows, Linux, or macOS

Software:

- Toolchain to compile code for ESP32
- Build tools - CMake and Ninja to build a full Application for ESP32
- ESP-IDF that essentially contains API (software libraries and source code) for ESP32 and scripts to operate the Toolchain
- Text editor to write programs (Projects) in C, e.g., Eclipse

![Diagram of development process]

Fig. 1: Development of applications for ESP32

1.3 Development Board Overviews

If you have one of ESP32 development boards listed below, you can click on the link to learn more about its hardware.

1.3.1 ESP32-DevKitC V4 Getting Started Guide

[]
This guide shows how to start using the ESP32-DevKitC V4 development board. For description of other versions of ESP32-DevKitC check *ESP32 Hardware Reference*.

### What You Need

- ESP32-DevKitC V4 board
- USB A / micro USB B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

### Overview

ESP32-DevKitC V4 is a small-sized ESP32-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-DevKitC V4 on a breadboard.

To cover a wide range of user requirements, the following versions of ESP32-DevKitC V4 are available:

- different ESP32 modules
  - *ESP32-WROOM-32*
  - *ESP32-WROOM-32D*
  - *ESP32-WROOM-32U*
  - *ESP32-SOLO-1*
  - *ESP32-WROVER*
  - *ESP32-WROVER-B*
  - *ESP32-WROVER-I*
  - *ESP32-WROVER-B (IPEX)*
- male or female pin headers.

For details please refer to *Espressif Product Ordering Information*.

### Functional Description

The following figure and the table below describe the key components, interfaces and controls of the ESP32-DevKitC V4 board.
### Fig. 2: ESP32-DevKitC V4 with ESP32-WROOM-32 module soldered

<table>
<thead>
<tr>
<th>Key Component</th>

</tr>
<tr>
<td>EN</td>
<td>Reset button.</td>
</tr>
<tr>
<td>Boot</td>
<td>Download button. Holding down <strong>Boot</strong> and then pressing <strong>EN</strong> initiates Firmware Download mode for downloading firmware through the serial port.</td>
</tr>
<tr>
<td>USB-to-UART Bridge</td>
<td>Single USB-UART bridge chip provides transfer rates of up to 3 Mbps.</td>
</tr>
<tr>
<td>Micro USB Port</td>
<td>USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32 module.</td>
</tr>
<tr>
<td>5V Power On LED</td>
<td>Turns on when the USB or an external 5V power supply is connected to the board. For details see the schematics in <em>Related Documents</em>.</td>
</tr>
<tr>
<td>I/O</td>
<td>Most of the pins on the ESP module are broken out to the pin headers on the board. You can program ESP32 to enable multiple functions such as PWM, ADC, DAC, I2C, I2S, SPI, etc.</td>
</tr>
</tbody>
</table>

**Note:** The pins D0, D1, D2, D3, CMD and CLK are used internally for communication between ESP32 and SPI flash memory. They are grouped on both sides near the USB connector. Avoid using these pins, as it may disrupt access to the SPI flash memory / SPI RAM.

**Note:** The pins GPIO16 and GPIO17 are available for use only on the boards with the modules ESP32-WROOM and ESP32-SOLO-1. The boards with ESP32-WROVER modules have the pins reserved for...
Power Supply Options

There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:** The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.

Note on C15

The component C15 may cause the following issues on earlier ESP32-DevKitC V4 boards:

- The board may boot into Download mode
- If you output clock on GPIO0, C15 may impact the signal

In case these issues occur, please remove the component. The figure below shows C15 highlighted in yellow.

![Fig. 3: Location of C15 (yellow) on ESP32-DevKitC V4 board](image)

Start Application Development

Before powering up your ESP32-DevKitC V4, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to *ESP32 Hardware Reference*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

1.3.2 ESP-WROVER-KIT V4.1 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V4.1 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check *ESP32 Hardware Reference*.

What You Need

- ESP-WROVER-KIT V4.1 board
- USB 2.0 cable A to Micro-B
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

Overview

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif.

ESP-WROVER-KIT features the following integrated components:

- ESP32-WROVER-B module
• LCD screen
• MicroSD card slot

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

**Note:** ESP32’s GPIO16 and GPIO17 are used as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

**Functionality Overview**

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

![Fig. 6: ESP-WROVER-KIT block diagram](image)

**Functional Description**

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
Fig. 7: ESP-WROVER-KIT board layout - front

Fig. 8: ESP-WROVER-KIT board layout - back
<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FT2232</td>
<td>The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232 chip enhances user-friendliness in terms of application development and debugging. See ESP-WROVER-KIT V4.1 schematic.</td>
</tr>
<tr>
<td>32.76kHz</td>
<td>External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.</td>
</tr>
<tr>
<td>0R</td>
<td>Zero-ohm resistor intended as a placeholder for a current shunt, can be desoldered or replaced with a current shunt to facilitate the measurement of ESP32’s current consumption in different modes.</td>
</tr>
<tr>
<td>ESP32-WROVER-B</td>
<td>This EPS32 module features 64-Mbit PSRAM for flexible extended storage and data processing capabilities.</td>
</tr>
<tr>
<td>Diagnostic LEDs</td>
<td>Four red LEDs connected to the GPIO pins of FT2232. Intended for future use.</td>
</tr>
<tr>
<td>UART</td>
<td>Serial port. The serial TX/RX signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP2 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32’s serial interface, remove the jumpers and connect another external serial device to the respective pins.</td>
</tr>
<tr>
<td>SPI</td>
<td>By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the voltage of this interface is 3.3V.</td>
</tr>
<tr>
<td>CTS/RTS</td>
<td>Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.</td>
</tr>
<tr>
<td>JTAG</td>
<td>JTAG interface. JTAG signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP2 respectively. By default, these pairs of pins are disconnected. To enable JTAG, short the respective pins with jumpers as shown in Section Setup Options.</td>
</tr>

</tbody>
</table>
分配 ESP32 引脚

有些引脚/引脚终端被分配用于与 onboard 或外部硬件的使用。如果该硬件未使用，例如，如果未将任何东西插入 Camera (JP4) 接头，那么这些 GPIO 可以用于其他用途。

有些引脚，如 GPIO0 或 GPIO2，具有多个功能，并且其中一些在 onboard 和外部外围设备之间共享。某些外围设备的组合无法正常工作。例如，无法对正在使用 SD 卡的应用程序进行 JTAG 调试，因为几个引脚被 JTAG 和 SD 卡槽共享。

在其他情况下，外围设备可以在某些条件下共存。例如，LCD 屏幕和 SD 卡共用单一引脚 GPIO21。此引脚用于提供 D/C（Data / Control）信号用于 LCD，以及从 SD 卡槽读取 CD（Card Detect）信号。如果卡检测功能不必要，可以移除 R167，以便 LCD 和 SD 卡共同工作。

有关哪些引脚共享，请参阅下一张表的表格。

主 I/O 连接器 / JP1

JP1 连接器包含 14x2 针脚，其功能显示在表格中间的“I/O”列。两侧的“共享”列描述了板上某一 GPIO 的其他用途。

32.768 kHz Oscillator

<table>
<thead>
<tr>
<th></th>
<th>ESP32 Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO32</td>
</tr>
<tr>
<td>2</td>
<td>GPIO33</td>
</tr>
</tbody>
</table>

**Note:** Since GPIO32 and GPIO33 are connected to the oscillator by default, they are not connected to the JP1 I/O connector to maintain signal integrity. This allocation may be changed from the oscillator to JP1 by desoldering the zero-ohm resistors from positions R11 / R23 and re-soldering them to positions R12 / R24.

SPI Flash / JP2

<table>
<thead>
<tr>
<th></th>
<th>ESP32 Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>CLK / GPIO6</td>
</tr>
<tr>
<td>2</td>
<td>SD0 / GPIO7</td>
</tr>
<tr>

<tr>
<td>4</td>
<td>SD2 / GPIO9</td>
</tr>
<tr>
<td>5</td>
<td>SD3 / GPIO10</td>
</tr>
<tr>
<td>6</td>
<td>CMD / GPIO11</td>
</tr>
</tbody>
</table>

**Important:** The module’s flash bus is connected to the jumper block JP2 through zero-ohm resistors R140 ~ R145. If the flash memory needs to operate at the frequency of 80 MHz, for reasons such as improving the integrity of bus signals, you can desolder these resistors to disconnect the module’s flash bus from the pin header JP2.

Start Application Development

Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

Initial Setup

Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP2.

Do not install any other jumpers.

Turn the Power Switch to ON, the 5V Power On LED should light up.

Now to Development

Please proceed to ESP32 Hardware Reference, where Section Installation Step by Step will quickly help you set up the development environment and then flash an example project onto your board.

ESP-WROVER-KIT V3 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V3 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP-WROVER-KIT V3 board
- USB 2.0 cable A to Micro-B
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and MicroSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.
Functional Description

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
Fig. 10: ESP-WROVER-KIT board layout - front
Fig. 11: ESP-WROVER-KIT board layout - back
<table>
<thead>

Allocation of ESP32 Pins

Some pins / terminals of ESP32 are allocated for use with the onboard or external hardware. If that hardware is not used, e.g., nothing is plugged into the Camera (JP4) header, then these GPIOs can be used for other purposes.

Some of the pins, such as GPIO00 or GPIO02, have multiple functions and some of them are shared among onboard and external peripheral devices. Certain combinations of peripherals cannot work together. For example, it is not possible to do JTAG debugging of an application that is using SD card, because several pins are shared by JTAG and the SD card slot.

In other cases, peripherals can coexist under certain conditions. This is applicable to, for example, LCD screen and SD card that share only a single pin GPIO21. This pin is used to provide D/C (Data / Control) signal for the LCD as well as the CD (Card Detect) signal read from the SD card slot. If the card detect functionality is not essential, then it may be disabled by removing R167, so both LCD and SD may operate together.

For more details on which pins are shared among which peripherals, please refer to the table in the next section.

Main I/O Connector / JP1

The JP1 connector consists of 14x2 male pins whose functions are shown in the middle two “I/O” columns of the table below. The two “Shared With” columns on both sides describe where else on the board a certain GPIO is used.

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 GPIO32</td>
</tr>
<tr>
<td>2 GPIO33</td>
</tr>
</tbody>
</table>

**Note:** Since GPIO32 and GPIO33 are connected to the oscillator by default, they are not connected to the JP1 I/O connector to maintain signal integrity. This allocation may be changed from the oscillator to JP1 by desoldering the zero-ohm resistors from positions R11 / R23 and re-soldering them to positions R12 / R24.

SPI Flash / JP13

<table>
<thead>
<tr>

</tr>
<tr>
<td>4 SD2 / GPIO9</td>
</tr>
<tr>
<td>5 SD3 / GPIO10</td>
</tr>
<tr>
<td>6 CMD / GPIO11</td>
</tr>
</tbody>
</table>

**Important:** The module’s flash bus is connected to the jumper block JP13 through zero-ohm resistors R140 ~ R145. If the flash memory needs to operate at the frequency of 80 MHz, for reasons such as improving the integrity of bus signals, you can desolder these resistors to disconnect the module’s flash bus from the pin header JP13.

Start Application Development

Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

Initial Setup

Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP11.

Do not install any other jumpers.

Turn the Power Switch to ON, the 5V Power On LED should light up.

Now to Development

Please proceed to ESP32 Hardware Reference, where Section Installation Step by Step will quickly help you set up the development environment and then flash an example project onto your board.

ESP-WROVER-KIT V2 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V2 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP-WROVER-KIT V2 board
- USB 2.0 cableA to Micro-B
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and MicroSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.
**Functionality Overview**

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

![ESP-WROVER-KIT block diagram](image)

*Fig. 12: ESP-WROVER-KIT block diagram*

**Functional Description**

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

1.3.3 ESP32-PICO-KIT V4 / V4.1 Getting Started Guide

This guide shows how to get started with the ESP32-PICO-KIT V4 / V4.1 mini development board. For the description of other ESP32-PICO-KIT versions, please check ESP32 Hardware Reference.

This particular description covers ESP32-PICO-KIT V4 and V4.1. The difference is the upgraded USB-UART bridge from CP2102 in V4 with up to 1 Mbps transfer rates to CP2102N in V4.1 with up to 3 Mbps transfer rates.

What You Need

- ESP32-PICO-KIT mini development board
- USB 2.0 A to Micro B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP32-PICO-KIT is an ESP32-based mini development board produced by Espressif.

The core of this board is ESP32-PICO-D4 - a System-in-Package (SiP) module with complete Wi-Fi and Bluetooth functionalities. Compared to other ESP32 modules, ESP32-PICO-D4 integrates the following peripheral components in one single package, which otherwise would need to be installed separately:

- 40 MHz crystal oscillator
- 4 MB flash
- Filter capacitors
- RF matching links

This setup reduces the costs of additional external components as well as the cost of assembly and testing and also increases the overall usability of the product.

The development board features a USB-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-D4 are led out to two rows of 20 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, 2 x 17 header pads are populated with two rows of male pin headers. The remaining 2 x 3 header pads beside the antenna are not populated. These pads may be populated later by the user if required.

Note:

1. The 2 x 3 pads not populated with pin headers are connected to the flash memory embedded in the ESP32-PICO-D4 SiP module. For more details see module’s datasheet in Related Documents.

2. ESP32-PICO-KIT comes with male headers by default.

Functionality Overview

The block diagram below shows the main components of ESP32-PICO-KIT and their interconnections.
Functional Description

The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT board.

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.
<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-PICO-D4</td>
<td>Standard ESP32-PICO-D4 module soldered to the ESP32-PICO-KIT board. The complete ESP32 system on a chip (ESP32 SoC) has been integrated into the SiP module, requiring only an external antenna with LC matching network, decoupling capacitors, and a pull-up resistor for EN signals to function properly.</td>
</tr>
<tr>
<td>LDO</td>
<td>5V-to-3.3V Low dropout voltage regulator (LDO).</td>
</tr>
<tr>

Power Supply Options

There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:** The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.

Pin Descriptions

The two tables below provide the **Name** and **Function** of I/O header pins on both sides of the board, see *ESP32-PICO-KIT board layout*. The pin numbering and header names are the same as in the schematic given in *Related Documents*.

1.3. Development Board Overviews

---

Header J3
The following notes give more information about the items in the tables above.

1. This pin is connected to the flash pin of ESP32-PICO-D4.
2. 32.768 kHz crystal oscillator: a) input b) output
3. This pin is connected to the pin of the USB bridge chip on the board.
4. The operating voltage of ESP32-PICO-KIT’s embedded SPI flash is 3.3V. Therefore, the strapping pin MTDI should hold bit zero during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

**Start Application Development**

Before powering up your ESP32-PICO-KIT, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to *ESP32 Hardware Reference*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

**Board Dimensions**

The dimensions are 52 x 20.3 x 10 mm (2.1” x 0.8” x 0.4”).

For the board physical construction details, please refer to its Reference Design listed below.

ESP32-PICO-KIT V3 Getting Started Guide

This guide shows how to get started with the ESP32-PICO-KIT V3 mini development board. For the description of other ESP32-PICO-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP32-PICO-KIT V3 mini development board
- USB 2.0 A to Micro B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP32-PICO-KIT V3 is an ESP32-based mini development board produced by Espressif. The core of this board is ESP32-PICO-D4 - a System-in-Package (SiP) module.

The development board features a USB-UART Bridge circuit, which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-D4 are led out to two rows of 20 x 0.1” header pads on both sides of the development board for easy access.

Functional Description

The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT V3 board.

1.3. Development Board Overviews
Fig. 19: ESP32-PICO-KIT V3 board layout

### 1.3.4 ESP32-Ethernet-Kit V1.1 Getting Started Guide

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.
The ESP32-Ethernet-Kit is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

**What You Need**

- ESP32-Ethernet-Kit V1.1 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

**Overview**

ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The *Ethernet board (A)* contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The *PoE board (B)* provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring, the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

**Functionality Overview**

The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

**Functional Description**

The following figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.

**Ethernet Board (A)**

The table below provides description starting from the picture’s top right corner and going clockwise.

</tr>
</tbody>
</table>
PoE Board (B)

This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under Functionality Overview. The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the RJ45 Port of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

![Fig. 23: ESP32-Ethernet-Kit - PoE board (B) layout (click to enlarge)](image)

</tr>
<tr>
<td>4</td>
<td>GPIO14</td>
</tr>
</tbody>
</table>
**Note:** Placement of GPIO pin number marking on the board’s silkscreen besides the DIP switch is incorrect. Please use instead the pin order as in the table above.

---

**RMII Clock Selection**

The ethernet MAC and PHY under RMII working mode need a common 50 MHz reference clock (i.e. RMII clock) that can be provided either externally, or generated from internal ESP32 APLL.

**Note:** For additional information on the RMII clock selection, please refer to ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic, sheet 2, location D2.

---

**RMII Clock Sourced Externally by PHY**

By default, the ESP32-Ethernet-Kit is configured to provide RMII clock for the IP101GRI PHY’s 50M_CLKO output. The clock signal is generated by the frequency multiplication of 25 MHz crystal connected to the PHY. For details, please see the figure below.

Please note that the PHY is reset on power up by pulling the RESET_N signal down with a resistor. ESP32 should assert RESET_N high with GPIO5 to enable PHY. Only this can ensure the power-up of system. Otherwise ESP32 may enter download mode (when the clock signal of REF_CLK_50M is at a high logic level during the GPIO0 power-up sampling phase).

**RMII Clock Sourced Internally from ESP32’s APLL**

Another option is to source the RMII Clock from internal ESP32 APLL, see figure below. The clock signal coming from GPIO0 is first inverted, to account for transmission line delay, and then supplied to the PHY.

To implement this option, users need to remove or add some RC components on the board. For details please refer to ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic, sheet 2, location D2. Please note that if the APLL is already used for other purposes (e.g. I2S peripheral), then you have no choice but use an external RMII clock.

---

**GPIO Allocation**

This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.

**IP101GRI (PHY) Interface**

The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).
Fig. 24: RMII Clock from IP101GRI PHY

Note:

1. To prevent the power-on state of the GPIO0 from being affected by the clock output on the PHY side, the RESET_N signal to PHY defaults to low, turning the clock output off. After power-on you can control RESET_N with GPIO5 to turn the clock output on. See also *RMII Clock Sourced Externally by PHY*. For PHYs that cannot turn off the clock output through RESET_N, it is recommended to use a crystal module that can be disabled / enabled externally. Similarly like when using RESET_N, the oscillator module should be disabled by default and turned on by ESP32 after power-up. For a reference design please see ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic.

2. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the
Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup**

1. Set the **Function Switch** on the *Ethernet board (A)* to its default position by turning all the switches to **ON**.
2. To simplify flashing and testing of the application, do not input extra signals to the board headers.
3. The *PoE board (B)* can now be plugged in, but do not connect external power to it.
4. Connect the *Ethernet board (A)* to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the **5V Power On LED** should light up.

**Now to Development**

Proceed to **Get Started**, where Section **Installation Step by Step** will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

**Configure and Load the Ethernet Example**

After setting up the development environment and testing the board, you can configure and flash the ethernet/ethernet example. This example has been created for testing Ethernet functionality. It supports different PHY, including *IP101GRI* installed on *ESP32-Ethernet-Kit V1.1*.

**Summary of Changes from ESP32-Ethernet-Kit V1.0**

- The original inverted clock provided to the PHY by ESP32 using GPIO0 has been replaced by a clock generated on PHY side. The PHY’s clock is connected to the ESP32 with same GPIO0. The GPIO2 which was originally used to control the active crystal oscillator on the PHY side, can now be used for other purposes.
- On power up, the ESP32 boot strapping pin GPIO0 may be affected by clock generated on the PHY side. To resolve this issue the PHY’s Reset-N signal is pulled low using resistor R17 and effectively turning off the PHY’s clock output. The Reset-N signal can be then pulled high by ESP32 using GPIO5.
- Removed FT2232H chip’s external SPI Flash U6.
- Removed flow control jumper header J4.
- Removed nTRST JTAG signal. The corresponding GPIO4 can now be used for other purposes.
- Pull-up resistor R68 on the GPIO15 line is moved to the MTDO side of JTAG.
- To make the A and B board connections more foolproof (reduce chances of plugging in the B board in reverse orientation), the original two 4-pin male rows on board A were changed to one 4-pin female row and one 4-pin male row. Corresponding male and female 4-pins rows were installed on board B.

ESP32-Ethernet-Kit V1.0 Getting Started Guide

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The ESP32-Ethernet-Kit is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

What You Need

- ESP32-Ethernet-Kit V1.0 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The Ethernet board (A) contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The PoE board (B) provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

Functionality Overview

The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.
Fig. 26: ESP32-Ethernet-Kit V1.0
Functional Description

The following two figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.

Ethernet Board (A)

The table below provides description starting from the picture’s top right corner and going clockwise.
### Key Component

Fig. 28: ESP32-Ethernet-Kit - Ethernet board (A) layout (click to enlarge)
PoE Board (B)

This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under Functionality Overview.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the RJ45 Port of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

Setup Options

This section describes options to configure the ESP32-Ethernet-Kit hardware.

Function Switch

The functions for specific GPIO pins can be selected with the Function Switch.

<table>
<thead>
<tr>

GPIO Allocation

This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.

IP101GRI (PHY) Interface

The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).

<table>
<thead>
<tr>
<th></th>
<th>ESP32 Pin (MAC)</th>
<th>IP101GRI (PHY)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO21</td>
<td>TX_EN</td>
</tr>
<tr>
<td>2</td>
<td>GPIO19</td>
<td>TXD[0]</td>
</tr>
<tr>
<td>3</td>
<td>GPIO22</td>
<td>TXD[1]</td>
</tr>
<tr>
<td>4</td>
<td>GPIO25</td>
<td>RXD[0]</td>
</tr>
<tr>
<td>5</td>
<td>GPIO26</td>
<td>RXD[1]</td>
</tr>
<tr>
<td>6</td>
<td>GPIO27</td>
<td>CRS_DV</td>
</tr>
<tr>
<td>7</td>
<td>GPIO0</td>
<td>REF_CLK</td>
</tr>
<tr>
<td>8</td>
<td>GPIO23</td>
<td>MDC</td>
</tr>
<tr>
<td>9</td>
<td>GPIO18</td>
<td>MDIO</td>
</tr>
</tbody>
</table>

Note: Except for REF_CLK, the allocation of all pins under the RMII Interface is fixed and cannot be changed either through IOMUX or GPIO Matrix.

GPIO Header 1

This header exposes some GPIOs that are not used elsewhere on the ESP32-Ethernet-Kit.
GPIO Header 2

This header contains the GPIOs with specific MII functionality (except GPIO2), as opposed to Reduced Media-Independent Interface (RMII) functionality implemented on ESP32-Ethernet-Kit board by default, see IP101GRI (PHY) Interface. Depending on the situation, if MMI is used, specific Ethernet applications might require this functionality.

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>MII Function</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 GPIO17</td>
<td>EMAC_CLK_180</td>
<td>See note 1</td>
</tr>
<tr>
<td>2 GPIO16</td>
<td>EMAC_CLK_OUT</td>
<td>See note 1</td>
</tr>
<tr>
<td>3 GPIO4</td>
<td>EMAC_TX_ER</td>
<td></td>
</tr>
<tr>
<td>4 GPIO2</td>
<td>n/a</td>
<td>See note 2</td>
</tr>
<tr>
<td>5 GPIO5</td>
<td>EMAC_RX_CLK</td>
<td>See note 2</td>
</tr>
</tbody>
</table>

Note:

1. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without SPIRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

2. Functionality depends on the settings of the Function Switch.

GPIO Header 3

The functionality of GPIOs connected to this header depends on the settings of the Function Switch.

<table>
<thead>
<tr>

</tbody>
</table>

**Note:**

1. GPIO2 is used to enable external oscillator of the PHY.
2. GPIO0 is a source of 50 MHz reference clock for the PHY. The clock signal is first inverted, to account for transmission line delay, and then supplied to the PHY.
3. To prevent affecting the power-on state of GPIO0 by the clock output on the PHY side, the PHY external oscillator is enabled using GPIO2 after ESP32 is powered up.
4. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without SPIRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

---

**Start Application Development**

Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.
Initial Setup

1. Set the **Function Switch** on the **Ethernet board (A)** to its default position by turning all the switches to **ON**.
2. To simplify flashing and testing the application, do not install any jumpers and do not connect any signals to the board headers.
3. The **PoE board (B)** can now be plugged in, but do not connect external power to it.
4. Connect the **Ethernet board (A)** to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the **5V Power On LED** should light up.

Now to Development

Proceed to **Get Started**, where Section **Installation Step by Step** will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

Configure and Load the Ethernet Example

After setting up the development environment and testing the board, you can configure and flash the `ethernet/ethernet` example. This example has been created for testing Ethernet functionality. It supports different PHY, including **IP101GRI** installed on **ESP32-Ethernet-Kit V1.0 board**.

1.4 Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

1.4.1 Setting up Development Environment

- **Step 1. Install prerequisites** for Windows, Linux or macOS
- **Step 2. Get ESP-IDF**
- **Step 3. Set up the tools**
- **Step 4. Set up the environment variables**
1.4.2 Creating Your First Project

- Step 5. Start a Project
- Step 6. Connect Your Device
- Step 7. Configure
- Step 8. Build the Project
- Step 9. Flash onto the Device
- Step 10. Monitor

1.5 Step 1. Install prerequisites

Some tools need to be installed on the computer before proceeding to the next steps. Follow the links below for the instructions for your OS:

1.5.1 Standard Setup of Toolchain for Windows

[ ]

Note: Currently only 64-bit versions of Windows are supported. 32-bit Windows can use the Legacy GNU Make Build System.

Introduction

ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we’re going to use the Command Prompt, but after ESP-IDF is installed you can use Eclipse or another graphical IDE with CMake support instead.

Note: Previous versions of ESP-IDF used the Legacy GNU Make Build System and MSYS2 Unix compatibility environment. This is no longer required, ESP-IDF can be used from the Windows Command Prompt.

ESP-IDF Tools Installer

The easiest way to install ESP-IDF’s prerequisites is to download the ESP-IDF Tools installer from this URL: https://dl.espressif.com/dl/esp-idf-tools-setup-2.3.exe

The installer includes the cross-compilers, OpenOCD, cmake and Ninja build tool. The installer can also download and run installers for Python 3.7 and Git For Windows if they are not already installed on the computer.

The installer also offers to download one of the ESP-IDF release versions.
Using the Command Prompt

For the remaining Getting Started steps, we’re going to use the Windows Command Prompt.

ESP-IDF Tools Installer creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs `export.bat` script to set up the environment variables (PATH, IDF_PATH and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in PATH. If you get errors related to Python or Git not being found, use the first option.

Next Steps

If the ESP-IDF Tools Installer has finished successfully, then the development environment setup is complete. Proceed directly to Step 5. Start a Project.

Related Documents

For advanced users who want to customize the install process:

Setup Windows Toolchain from Scratch

This is a step-by-step alternative to running the ESP-IDF Tools Installer for the CMake-based build system. Installing all of the tools by hand allows more control over the process, and also provides the information for advanced users to customize the install.

To quickly setup the toolchain and other tools in standard way, using the ESP-IDF Tools installer, proceed to section Standard Setup of Toolchain for Windows.

Note: The GNU Make based build system requires the MSYS2 Unix compatibility environment on Windows. The CMake-based build system does not require this environment.

Get ESP-IDF

Note: Previous versions of ESP-IDF used the MSYS2 bash terminal command line. The current cmake-based build system can run in the regular Windows Command Prompt which is used here.

If you use a bash-based terminal or PowerShell, please note that some command syntax will be different to what is shown below.

Open Command Prompt and run the following commands:
```bash
mkdir %userprofile%/esp
cd %userprofile%/esp
git clone -b v4.1 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `%userprofile%/esp/esp-idf`.

**Note:** The `git clone` option `-b v4.1` tells `git` to clone the tag in the ESP-IDF repository `git clone` corresponding to this version of the documentation.

**Note:** As a fallback, it is also possible to download a zip file of this stable release from the [Releases page](https://github.com/espressif/esp-idf/releases). Do not download the “Source code” zip file(s) generated automatically by GitHub, they do not work with ESP-IDF.

**Note:** Do not miss the `--recursive` option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

```bash
cd esp-idf
git submodule update --init
```

## Tools

### cmake

Download the latest stable release of CMake for Windows and run the installer.

When the installer asks for Install Options, choose either “Add CMake to the system PATH for all users” or “Add CMake to the system PATH for the current user”.

### Ninja build

**Note:** Ninja currently only provides binaries for 64-bit Windows. It is possible to use CMake and `idf.py` with other build tools, such as mingw-make, on 32-bit windows. However this is currently undocumented.

The Ninja for Windows download is a `.zip` file containing a single `ninja.exe` file which needs to be unzipped to a directory which is then *added to your Path* (or you can choose a directory which is already on your Path).

### Python

Download the latest Python for Windows installer, and run it.

The “Customise” step of the Python installer gives a list of options. The last option is “Add python.exe to Path”. Change this option to select “Will be installed”.

Once Python is installed, open a Windows Command Prompt from the Start menu and run the following command:
pip install --user pyserial

Toolchain Setup

Download the precompiled Windows toolchain:

Unzip the zip file to C:\Program Files (or some other location). The zip file contains a single directory xtensa-esp32-elf.

Next, the bin subdirectory of this directory must be added to your Path. For example, the directory to add may be C:\Program Files\xtensa-esp32-elf\bin.

Note: If you already have the MSYS2 environment (for use with the “GNU Make” build system) installed, you can skip the separate download and add the directory C:\msys32\opt\xtensa-esp32-elf\bin to the Path instead, as the toolchain is included in the MSYS2 environment.

Adding Directory to Path

To add any new directory to your Windows Path environment variable:

Open the System control panel and navigate to the Environment Variables dialog. (On Windows 10, this is found under Advanced System Settings).

Double-click the Path variable (either User or System Path, depending if you want other users to have this directory on their path.) Go to the end of the value, and append ;<new value>.

Next Steps

To carry on with development environment setup, proceed to Step 2. Get ESP-IDF.

Updating ESP-IDF tools on Windows

Install ESP-IDF tools using a script

From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

install.bat

For Powershell, change to the directory where ESP-IDF is installed. Then run:

install.ps1

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is C:\Users\username\espressif.
Add ESP-IDF tools to PATH using an export script

ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt”. This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn’t started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

### 1.5.2 Standard Setup of Toolchain for Linux

#### Install Prerequisites

To compile with ESP-IDF you need to get the following packages:

- **CentOS 7:**
  ```bash
  sudo yum install git wget flex bison gperf python cmake ninja-build ccache
  ```

- **Ubuntu and Debian:**
  ```bash
  sudo apt-get install git wget flex bison gperf python python-pip python–>setuptools cmake ninja-build ccache libffi-dev libssl-dev
  ```

- **Arch:**
  ```bash
  sudo pacman -S --needed gcc git make flex bison gperf python-pip cmake ninja–>ccache
  ```

**Note:** CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake”.

#### Additional Tips

##### Permission issues /dev/ttyUSB0

With some Linux distributions you may get the `Failed to open port /dev/ttyUSB0` error message when flashing the ESP32. *This can be solved by adding the current user to the dialout group.*
Setting up Python 3 as default for Ubuntu and Debian

Ubuntu and Debian are still providing Python 2.7 as the default interpreter. Python 3 can be installed as follows:

```bash
sudo apt-get install python3 python3-pip python3-setuptools
```

Making Python 3 the default interpreter is possible by running:

```bash
sudo update-alternatives --install /usr/bin/python python /usr/bin/python3 10
```

**Note:** This is system-wide change which may affect all of the applications.

Next Steps

To carry on with development environment setup, proceed to Step 2. Get ESP-IDF.

Related Documents

Setup Linux Toolchain from Scratch

[]

The following instructions are alternative to downloading binary toolchain from Espressif website. To quickly setup the binary toolchain, instead of compiling it yourself, backup and proceed to section Standard Setup of Toolchain for Linux.

**Note:** The reason you might need to build your own toolchain is to solve the Y2K38 problem (time_t expand to 64 bits instead of 32 bits).

Install Prerequisites

To compile with ESP-IDF you need to get the following packages:

- **CentOS 7**:

  ```bash
  sudo yum install git wget ncurses-devel flex bison gperf python pyserial python-
  →pyelftools cmake ninja-build ccache
  ```

- **Ubuntu and Debian**:

  ```bash
  sudo apt-get install git wget libncurses-dev flex bison gperf python python-pip-
  →python-setuptools python-serial python-click python-cryptography python-future-
  →python-pyparsing python-pyelftools cmake ninja-build ccache libffi-dev libssl-
  →dev
  ```

- **Arch**:

  ```bash
  sudo pacman -S --needed gcc git make ncurses flex bison gperf python-pyserial-
  →python-click python-cryptography python-future python-pyparsing python-
  →pyelftools cmake ninja ccache
  ```

1.5. Step 1. Install prerequisites
Compile the Toolchain from Source

- Install dependencies:
  - CentOS 7:
    ```
sudo yum install gawk gperf grep gettext ncurses-devel python python-devel
                  automake bison flex texinfo help2man libtool make
    ```
  - Ubuntu pre-16.04:
    ```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev
                  automake bison flex texinfo help2man libtool libtool-bin make
    ```
  - Ubuntu 16.04 or newer:
    ```
sudo apt-get install gawk gperf grep gettext python python-dev automake bison
                  flex texinfo help2man libtool libtool-bin make
    ```
  - Debian 9:
    ```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev
                  automake bison flex texinfo help2man libtool libtool-bin make
    ```
  - Arch:
    ```
    TODO
    ```

Create the working directory and go into it:

```
mkdir -p ~/esp
cd ~/esp
```

Download crosstool-NG and build it:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2020r2
git submodule update --init
./bootstrap
./configure --enable-local
make
```

**Note:** To create a toolchain with support for 64-bit time_t, you need to remove the `--enable-newlib-long-time_t` option from the `crosstool-NG/samples/xtensa-esp32-elf/crosstool.config` file in 33 and 43 lines.

Build the toolchain:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```
Toolchain will be built in ~/esp/crosstool-NG/builds/xtensa-esp32-elf. Follow instructions for standard setup to add the toolchain to your PATH.

Next Steps

To carry on with development environment setup, proceed to Step 2. Get ESP-IDF.

1.5.3 Standard Setup of Toolchain for Mac OS

Install Prerequisites

ESP-IDF will use the version of Python installed by default on macOS.

- install pip:

  ```
sudo easy_install pip
  ```

- install pyserial:

  ```
pip install --user pyserial
  ```

- install CMake & Ninja build:

  - If you have HomeBrew, you can run:

    ```
brew install cmake ninja
    ```

  - If you have MacPorts, you can run:

    ```
sudo port install cmake ninja
    ```

  - Otherwise, consult the CMake and Ninja home pages for macOS installation downloads.

- It is strongly recommended to also install ccache for faster builds. If you have HomeBrew, this can be done via brew install ccache or sudo port install ccache on MacPorts.

Note: If an error like this is shown during any step:

```plaintext
```

Then you will need to install the XCode command line tools to continue. You can install these by running xcode-select --install.

Next Steps

To carry on with development environment setup, proceed to Step 2. Get ESP-IDF.

1.5. Step 1. Install prerequisites
Related Documents

Setup Toolchain for Mac OS from Scratch

[]

Package Manager

To set up the toolchain from scratch, rather than downloading a pre-compiled toolchain, you will need to install either the MacPorts or homebrew package manager.

MacPorts needs a full XCode installation, while homebrew only needs XCode command line tools.

See Customized Setup of Toolchain section for some of the reasons why installing the toolchain from scratch may be necessary.

Install Prerequisites

- install pip:
  ```
  sudo easy_install pip
  ```

- install pyserial:
  ```
  pip install --user pyserial
  ```

- install CMake & Ninja build:
  - If you have HomeBrew, you can run:
    ```
    brew install cmake ninja
    ```
  - If you have MacPorts, you can run:
    ```
    sudo port install cmake ninja
    ```

Compile the Toolchain from Source

- Install dependencies:
  - with MacPorts:
    ```
    sudo port install gsed gawk binutils gperf grep gettext wget libtool autoconf
    `→automake make
    ```
  - with homebrew:
    ```
    brew install gnu-sed gawk binutils gperftools gettext wget help2man libtool
    `→autoconf automake make
    ```

Create a case-sensitive filesystem image:
hdiutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive HFS+"

Mount it:

hdiutil mount ~/esp/crosstool.dmg

Create a symlink to your work directory:

mkdir -p ~/esp
ln -s /Volumes/ctng ~/esp/ctng-volume

Go into the newly created directory:

cd ~/esp/ctng-volume

Download crosstool-NG and build it:

git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2020r2
git submodule update --init
./bootstrap && ./configure --enable-local && make

Build the toolchain:

./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf

Toolchain will be built in ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf. To use it, you need to add ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf/bin to PATH environment variable.

**Next Steps**

To carry on with development environment setup, proceed to *Step 2. Get ESP-IDF*. 

<table>
<thead>
<tr>
<th>Windows</th>
<th>Linux</th>
<th>Mac OS</th>
</tr>
</thead>
</table>

---

1.5. Step 1. Install prerequisites
1.6 Step 2. Get ESP-IDF

To build applications for the ESP32, you need the software libraries provided by Espressif in ESP-IDF repository. To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

**Note:** This guide uses the directory `~/esp` on Linux and macOS or `%userprofile%\esp` on Windows as an installation folder for ESP-IDF. You can use any directory, but you will need to adjust paths for the commands respectively. Keep in mind that ESP-IDF does not support spaces in paths.

### 1.6.1 Linux and macOS

Open Terminal, and run the following commands:

```bash
cd ~/esp
git clone -b v4.1 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult *ESP-IDF Versions* for information about which ESP-IDF version to use in a given situation.

### 1.6.2 Windows

In addition to installing the tools, *ESP-IDF Tools Installer* for Windows introduced in Step 1 can also download a copy of ESP-IDF.

Consult *ESP-IDF Versions* for information about which ESP-IDF version to use in a given situation.

If you wish to download ESP-IDF without the help of ESP-IDF Tools Installer, refer to these instructions.

1.7 Step 3. Set up the tools

Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc.

### 1.7.1 Windows

*ESP-IDF Tools Installer* for Windows introduced in Step 1 installs all the required tools.

If you want to install the tools without the help of ESP-IDF Tools Installer, open the Command Prompt and follow these steps:

```bash
cd %userprofile%\esp\esp-idf
install.bat
```

or with Windows PowerShell

```bash
cd ~/esp/esp-idf
./install.ps1
```
1.7.2 Linux and macOS

```
cd ~/esp/esp-idf
./install.sh
```

1.7.3 Customizing the tools installation path

The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: 
$HOME/.espressif on Linux and macOS, %USERPROFILE%\espressif on Windows. If you wish to install the tools into a different directory, set the environment variable IDF_TOOLS_PATH before running the installation scripts. Make sure that your user has sufficient permissions to read and write this path.

If changing the IDF_TOOLS_PATH, make sure it is set to the same value every time the Install script (install.bat, install.ps1 or install.sh) and an Export script (export.bat, export.ps1 or export.sh) are executed.

1.8 Step 4. Set up the environment variables

The installed tools are not yet added to the PATH environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

1.8.1 Windows

**ESP-IDF Tools Installer** for Windows creates an “ESP-IDF Command Prompt” shortcut in the Start Menu. This shortcut opens the Command Prompt and sets up all the required environment variables. You can open this shortcut and proceed to the next step.

Alternatively, if you want to use ESP-IDF in an existing Command Prompt window, you can run:

```
%userprofile%\esp\esp-idf\export.bat
```

or with Windows PowerShell

```
.$HOME/esp/esp-idf/export.ps1
```

1.8.2 Linux and macOS

In the terminal where you are going to use ESP-IDF, run:

```
. $HOME/esp/esp-idf/export.sh
```

Note the space between the leading dot and the path!

You can also create an alias for the export script to your .profile or .bash_profile script. This way you can set up the environment in a new terminal window by typing get_idf:

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

Note that it is not recommended to source export.sh from the profile script directly. Doing so activates IDF virtual environment in every terminal session (even in those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

---

1.8. Step 4. Set up the environment variables 81
1.9 Step 5. Start a Project

Now you are ready to prepare your application for ESP32. You can start with get-started/hello_world project from examples directory in IDF.

Copy get-started/hello_world to ~/esp directory:

1.9.1 Linux and macOS

```bash
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

1.9.2 Windows

```bash
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

There is a range of example projects in the examples directory in ESP-IDF. You can copy any project in the same way as presented above and run it.

It is also possible to build examples in-place, without copying them first.

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

1.10 Step 6. Connect Your Device

Now connect your ESP32 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows:** names like COM1
- **Linux:** starting with /dev/tty
- **macOS:** starting with /dev/cu.

If you are not sure how to check the serial port name, please refer to *Establish Serial Connection with ESP32* for full details.

**Note:** Keep the port name handy as you will need it in the next steps.

1.11 Step 7. Configure

Navigate to your hello_world directory from Step 5. *Start a Project* and run the project configuration utility menuconfig.
### 1.11.1 Linux and macOS

```bash
cd ~/esp/hello_world
idf.py menuconfig
```

### 1.11.2 Windows

```bash
cd %userprofile%\esp\hello_world
idf.py menuconfig
```

If the previous steps have been done correctly, the following menu appears:

![Menu Configuration](image)

**Fig. 30: Project configuration - Home window**

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

To navigate and use `menuconfig`, press the following keys:

- Arrow keys for navigation
- Enter to go into a submenu
- Esc to go up one level or exit
- ? to see a help screen. Enter key exits the help screen
- Space, or Y and N keys to enable (Yes) and disable (No) configuration items with checkboxes “[*]”
- ? while highlighting a configuration item to display help about that item
- / to find configuration items

**Attention:** If you use ESP32-DevKitC board with the ESP32-SOLO-1 module, enable single core mode (`CONFIG_FREERTOS_UNICORE`) in menuconfig before flashing examples.
1.12 Step 8. Build the Project

Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello-world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
```
  $/components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash --flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello-world.bin
  $ build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/partition-table.bin
  or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary .bin file.

1.13 Step 9. Flash onto the Device

Flash the binaries that you just built onto your ESP32 board by running:

```
idf.py -p PORT [-b BAUD] flash
```

Replace PORT with your ESP32 board’s serial port name from Step 6. Connect Your Device.

You can also change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

For more information on idf.py arguments, see `idf.py`.

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

```
Running esptool.py in directory [...]/esp/hello_world
Executing "python [...]/esp-idf/components/esptool_py/esptool/esptool.py -b 460800 --write_flash @flash_project_args"
esptool.py -b 460800 write_flash --flash_mode dio --flash_size detect --flash_freq 40m 0x1000 bootloader/bootloader.bin 0x8000 partition_table/partition-table.bin
--0x10000 hello-world.bin
esptool.py v2.3.1
```

(continues on next page)

Hash of data verified.
Leaving...
Hard resetting via RTS pin...

If there are no issues by the end of the flash process, the module will be reset and the “hello_world” application will be running.

1.14 Step 10. Monitor

To check if “hello_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the IDF Monitor application:

```
$ idf.py -p /dev/ttyUSB0 monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_world/...build/hello-world.elf"
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
...
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
Hello world!
Restarting in 10 seconds...
```
To exit IDF monitor use the shortcut Ctrl+].

If IDF monitor fails shortly after the upload, or, if instead of the messages above, you see random garbage similar to what is given below, your board is likely using a 26MHz crystal. Most development board designs use 40MHz, so ESP-IDF uses this frequency as a default value.

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to menuconfig.
3. Go to Component config –> ESP32-specific –> Main XTAL frequency, then change CONFIG_ESP32_XTAL_FREQ_SEL to 26MHz.
4. After that, build and flash the application again.

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- **idf.py** for a full reference of idf.py commands and options.

That’s all that you need to get started with ESP32!

Now you are ready to try some other examples, or go straight to developing your own applications.

### 1.15 Updating ESP-IDF

You should update ESP-IDF from time to time, as newer versions fix bugs and provide new features. The simplest way to do the update is to delete the existing esp-idf folder and clone it again, as if performing the initial installation described in Step 2. Get ESP-IDF.

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at Step 3. Set up the tools.

Once the new tools are installed, update the environment using the Export script. See instructions at Step 4. Set up the environment variables.

1.16.1 Establish Serial Connection with ESP32

This section provides guidance on how to establish a serial connection between ESP32 and PC.

Connect ESP32 to PC

Connect the ESP32 board to the PC using the USB cable. If the device driver does not install automatically, identify USB to serial converter chip on your ESP32 board (or external converter dongle), search for drivers in internet, and install them.

Below are the links to drivers for ESP32 boards produced by Espressif:

<table>
<thead>
<tr>
<th>Development Board</th>
<th>USB Driver</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-DevKitC</td>
<td>CP210x</td>
<td></td>
</tr>
<tr>
<td>ESP32-LyraT</td>
<td>CP210x</td>
<td></td>
</tr>
<tr>
<td>ESP32-LyraTD-MSC</td>
<td>CP210x</td>
<td></td>
</tr>
<tr>
<td>ESP32-PICO-KIT</td>
<td>CP210x</td>
<td></td>
</tr>
<tr>
<td>ESP-WROVER-KIT</td>
<td>FTDI</td>
<td></td>
</tr>
<tr>
<td>ESP32 Demo Board</td>
<td>FTDI</td>
<td></td>
</tr>
<tr>
<td>ESP-Prog</td>
<td>FTDI</td>
<td>Programmer board (w/o ESP32)</td>
</tr>
<tr>
<td>ESP32-MeshKit-Sense</td>
<td>n/a</td>
<td>Use with ESP-Prog</td>
</tr>
<tr>
<td>ESP32-Sense Kit</td>
<td>n/a</td>
<td>Use with ESP-Prog</td>
</tr>
</tbody>
</table>

- CP210x: CP210x USB to UART Bridge VCP Drivers
- FTDI: FTDI Virtual COM Port Drivers

The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with the operating system and automatically installed upon connecting one of the listed boards to the PC.

Check port on Windows

Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

Check port on Linux and MacOS

To check the device name for the serial port of your ESP32 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```bash
ls /dev/tty*
```

MacOS
Fig. 31: USB to UART bridge of ESP32-DevKitC in Windows Device Manager
Fig. 32: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
ls /dev/cu.*

**Note:** MacOS users: if you don’t see the serial port then check you have the USB/serial drivers installed as shown in the Getting Started guide for your particular development board. For MacOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about “System Software from developer …” where the developer name is Silicon Labs or FTDI.

### Adding user to `dialout` on Linux

The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to *dialout* group with the following command:

```
sudo usermod -a -G dialout $USER
```

On Arch Linux this is done by adding the user to *uucp* group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

### Verify serial connection

Now verify that the serial connection is operational. You can do this using a serial terminal program. In this example we will use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Then open serial port in terminal and check, if you see any log printed out by ESP32. The log contents will depend on application loaded to ESP32. An example log by ESP32 is shown below.

```
ets Jun  8 2016 00:22:57

entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```
Fig. 33: Setting Serial Communication in PuTTY on Windows
Fig. 34: Setting Serial Communication in PuTTY on Linux
If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the esptool documentation for more details.

**Note:** Close serial terminal after verification that communication is working. In the next step we are going to use a different application to upload a new firmware to ESP32. This application will not be able to access serial port while it is open in terminal.

If you got here from *Step 6. Connect Your Device* when installing s/w for ESP32 development, then you can continue with *Step 7. Configure*.

### 1.16.2 Build and Flash with Eclipse IDE

[ ]

ESP-IDF V4.0 has a new CMake-based build system as the default build system. There is a new ESP-IDF Eclipse Plugin that works with the CMake-based build system. Please refer to [https://github.com/espressif/idf-eclipse-plugin/blob/master/README.md](https://github.com/espressif/idf-eclipse-plugin/blob/master/README.md) for further instructions.

If you require Eclipse IDE support for legacy ESP_IDF Make build system, you can follow the *legacy GNU Make build system Getting Started guide* which has steps for *Building and Flashing with Eclipse IDE*.

### 1.16.3 IDF Monitor

[ ]

The IDF monitor tool is mainly a serial terminal program which relays serial data to and from the target device’s serial port. It also provides some IDF-specific features.

This tool can be launched from an IDF project by running `idf.py monitor`.

(For the legacy GNU Make system, run `make monitor`.)

**Keyboard Shortcuts**

For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.
<table>
<thead>
<tr>
<th>Keyboard Shortcut</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+]</td>
<td>Exit the program</td>
<td></td>
</tr>
<tr>
<td>Ctrl+T</td>
<td>Menu escape key</td>
<td>Press and follow it by one of the keys given below.</td>
</tr>
<tr>
<td>• Ctrl+T</td>
<td>Send the menu character itself to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+]</td>
<td>Send the exit character itself to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+P</td>
<td>Reset target into bootloader to pause app via RTS line</td>
<td>Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.</td>
</tr>
<tr>
<td>• Ctrl+R</td>
<td>Reset target board via RTS</td>
<td>Resets the target board and re-starts the application via the RTS line (if connected).</td>
</tr>
<tr>
<td>• Ctrl+F</td>
<td>Build and flash the project</td>
<td>Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>• Ctrl+A (or A)</td>
<td>Build and flash the app only</td>
<td>Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>• Ctrl+Y</td>
<td>Stop/resume log output printing on screen</td>
<td>Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.</td>
</tr>
<tr>
<td>• Ctrl+L</td>
<td>Stop/resume log output saved to file</td>
<td>Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).</td>
</tr>
<tr>
<td>• Ctrl+H (or H)</td>
<td>Display all keyboard shortcuts</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+X (or X)</td>
<td>Exit the program</td>
<td></td>
</tr>
</tbody>
</table>

Any keys pressed, other than Ctrl-] and Ctrl-T, will be sent through the serial port.

**IDF-specific features**
Automatic Address Decoding

Whenever ESP-IDF outputs a hexadecimal code address of the form 0x4_______, IDF Monitor uses `addr2line` to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:

Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was unhandled.
Register dump:
PC : 0x400f360d PS : 0x00060330 A0 : 0x800dbf56 A1 : 0x3ffb7e00

To decode each address, IDF Monitor runs the following command in the background:

```
xtensa-esp32-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```
Launching GDB with GDBStub

By default, if esp-idf crashes, the panic handler prints relevant registers and the stack dump (similar to the ones above) over the serial port. Then it resets the board.

Optionally, the panic handler can be configured to run GDBStub, the tool which can communicate with GDB project debugger. GDBStub allows to read memory, examine call stack frames and variables, etc. It is not as versatile as JTAG debugging, but this method does not require any special hardware.

To enable GDBStub, open the project configuration menu (idf.py menuconfig) and set CONFIG_ESP32_PANIC to Invoke GDBStub.

In this case, if the panic handler is triggered, as soon as IDF Monitor sees that GDBStub has loaded, it automatically pauses serial monitoring and runs GDB with necessary arguments. After GDB exits, the board is reset via the RTS serial line. If this line is not connected, please reset the board manually by pressing its Reset button.

In the background, IDF Monitor runs the following command:

```
xptensa-esp32-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex interrupt build/PROJECT.elf
```

Output Filtering

IDF monitor can be invoked as idf.py monitor --print-filter="xyz", where --print-filter is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of <tag>:<log_level> items where <tag> is the tag string and <log_level> is a character from the set {N, E, W, I, D, V, *} referring to a level for logging.

For example, PRINT_FILTER="tag1:W" matches and prints only the outputs written with ESP_LOGW("tag1", ...) or at lower verbosity level, i.e. ESP_LOGE("tag1", ...). Not specifying a <log_level> or using * defaults to Verbose level.

**Note:** Use primary logging to disable at compilation the outputs you do not need through the logging library. Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks *, and semicolons : to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

Examples Of Filtering Rules:

- * can be used to match any tags. However, the string PRINT_FILTER="*:I tag1:E" with regards to tag1 prints errors only, because the rule for tag1 has a higher priority over the rule for *.
- The default (empty) rule is equivalent to *:*V because matching every tag at the Verbose level or lower means matching everything.
- "*:N" suppresses not only the outputs from logging functions, but also the prints made by printf, etc. To avoid this, use *:*E or a higher verbosity level.
- Rules "tag1:V", "tag1:v", "tag1:", "tag1:*", and "tag1" are equivalent.
• Rule "tag1:W tag1:E" is equivalent to "tag1:E" because any consequent occurrence of the same tag name overwrites the previous one.

• Rule "tag1:I tag2:W" only prints tag1 at the Info verbosity level or lower and tag2 at the Warning verbosity level or lower.

• Rule "tag1:I tag2:W tag3:N" is essentially equivalent to the previous one because tag3:N specifies that tag3 should not be printed.

• tag3:N in the rule "tag1:I tag2:W tag3:N *:V" is more meaningful because without tag3:N the tag3 messages could have been printed; the errors for tag1 and tag2 will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

A More Complex Filtering Example

The following log snippet was acquired without any filtering options:

```
load:0x40078000, len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]: status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID 1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options PRINT_FILTER="wifi esp_image:E light_driver:I" is given below:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `PRINTFILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` show the following output:

```
load:0x40078000, len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]: status: 1, mode: 2
```

Known Issues with IDF Monitor

Issues Observed on Windows

• If in the Windows environment you receive the error “winpty: command not found”, fix it by running `pacman -S winpty`.

• Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.

• Occasionally, when “idf.py” or “make” exits, it might stall for up to 30 seconds before IDF Monitor resumes.

• When “gdb” is run, it might stall for a short time before it begins communicating with the GDBStub.
1.16.4 Customized Setup of Toolchain

Instead of downloading binary toolchain from Espressif website (see Step 3. Set up the tools) you may build the toolchain yourself.

If you can’t think of a reason why you need to build it yourself, then probably it’s better to stick with the binary version. However, here are some of the reasons why you might want to compile it from source:

- if you want to customize toolchain build configuration
- if you want to use a different GCC version (such as 4.8.5)
- if you want to hack gcc or newlib or libstdc++
- if you are curious and/or have time to spare
- if you don’t trust binaries downloaded from the Internet

In any case, here are the instructions to compile the toolchain yourself.

1.16.5 Get Started (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

This document is intended to help you set up the software development environment for the hardware based on Espressif ESP32.

After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then how to build and flash firmware onto an ESP32 board.

Note: This is documentation for stable version v4.1 of ESP-IDF. Other ESP-IDF Versions are also available.

Introduction

ESP32 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth 4.2
- Dual high performance cores
- Ultra Low Power co-processor
- Several peripherals

Powered by 40 nm technology, ESP32 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.
What You Need

Hardware:

- An **ESP32** board
- **USB cable** - USB A / micro USB B
- **Computer** running Windows, Linux, or macOS

Software:

- **Toolchain** to build the **Application** for ESP32
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32 and scripts to operate the **Toolchain**
- **Text editor** to write programs (**Projects**) in C, e.g., **Eclipse**

![Fig. 35: Development of applications for ESP32](image)

Development Board Overviews

If you have one of ESP32 development boards listed below, you can click on the link to learn more about its hardware.

Installation Step by Step

This is a detailed roadmap to walk you through the installation process.
Setting up Development Environment

- **Step 1. Set up the Toolchain** for Windows, Linux or macOS
- **Step 2. Get ESP-IDF**
- **Step 3. Set Environment Variables**
- **Step 4. Install the Required Python Packages**

Creating Your First Project

- **Step 5. Start a Project**
- **Step 6. Connect Your Device**
- **Step 7. Configure**
- **Step 8. Build and Flash**
- **Step 9. Monitor**

**Step 1. Set up the Toolchain**

The toolchain is a set of programs for compiling code and building applications. The quickest way to start development with ESP32 is by installing a prebuilt toolchain. Pick up your OS below and follow the provided instructions.

**Standard Setup of Toolchain for Windows (Legacy GNU Make)**

Introduction

Windows doesn’t have a built-in “make” environment, so as well as installing the toolchain you will need a GNU-compatible environment. We use the MSYS2 environment to provide this. You don’t need to use this environment all the time (you can use Eclipse or some other front-end), but it runs behind the scenes.

Toolchain Setup

The quick setup is to download the Windows all-in-one toolchain & MSYS2 zip file from dl.espressif.com:

Unzip the zip file to C:\ (or some other location, but this guide assumes C:\) and it will create an msys32 directory with a pre-prepared environment.
**Important:** If another toolchain location is used (different than the default `C:\msys32`), please ensure that the path where the all-in-one toolchain gets unzipped is a plain ASCII, contains no spaces, symlinks or accents.

**Check it Out**

Open a MSYS2 MINGW32 terminal window by running `C:\msys32\mingw32.exe`. The environment in this window is a bash shell. Create a directory named `esp` that is a default location to develop ESP32 applications. To do so, run the following shell command:

```
mkdir -p ~/esp
```

By typing `cd ~/esp` you can then move to the newly created directory. If there are no error messages you are done with this step.

![Fig. 36: MSYS2 MINGW32 shell window](image)

Use this window in the following steps setting up development environment for ESP32.

**Next Steps**

To carry on with development environment setup, proceed to section *Step 2. Get ESP-IDF*.

**Updating The Environment**

When IDF is updated, sometimes new toolchains are required or new requirements are added to the Windows MSYS2 environment. To move any data from an old version of the precompiled environment to a new one:

- Take the old MSYS2 environment (ie `C:\msys32`) and move/rename it to a different directory (ie `C:\msys32_old`).
- Download the new precompiled environment using the steps above.
- Unzip the new MSYS2 environment to `C:\msys32` (or another location).
- Find the old `C:\msys32_old\home` directory and move this into `C:\msys32`.
- You can now delete the `C:\msys32_old` directory if you no longer need it.

You can have independent different MSYS2 environments on your system, as long as they are in different directories. There are also *steps to update the existing environment without downloading a new one*, although this is more complex.
Read the Docs Template Documentation, Release v4.1

Related Documents

Setup Windows Toolchain from Scratch (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Setting up the environment gives you some more control over the process, and also provides the information for advanced users to customize the install. The pre-built environment, addressed to less experienced users, has been prepared by following these steps.

To quickly setup the toolchain in standard way, using a prebuilt environment, proceed to section Standard Setup of Toolchain for Windows (Legacy GNU Make).

Configure Toolchain & Environment from Scratch

This process involves installing MSYS2, then installing the MSYS2 and Python packages which ESP-IDF uses, and finally downloading and installing the Xtensa toolchain.

• Navigate to the MSYS2 installer page and download the msys2-i686-xxxxxxxx.exe installer executable (we only support a 32-bit MSYS environment, it works on both 32-bit and 64-bit Windows.) At time of writing, the latest installer is msys2-i686-20161025.exe.

• Run through the installer steps. Uncheck the “Run MSYS2 32-bit now” checkbox at the end.

• Once the installer exits, open Start Menu and find “MSYS2 MinGW 32-bit” to run the terminal.

(Why launch this different terminal? MSYS2 has the concept of different kinds of environments. The default “MSYS” environment is Cygwin-like and uses a translation layer for all Windows API calls. We need the “MinGW” environment in order to have a native Python which supports COM ports.)

• The ESP-IDF repository on github contains a script in the tools directory titled windows_install_prerequisites.sh. If you haven’t got a local copy of the ESP-IDF yet, that’s OK - you can just download that one file in Raw format from here: tools/windows/windows_install_prerequisites.sh. Save it somewhere on your computer.

• Type the path to the shell script into the MSYS2 terminal window. You can type it as a normal Windows path, but use forward-slashes instead of back-slashes. ie: C:/Users/myuser/Downloads/windows_install_prerequisites.sh. You can read the script beforehand to check what it does.

• The windows_install_prerequisites.sh script will download and install packages for ESP-IDF support, and the ESP32 toolchain.

Troubleshooting

• While the install script runs, MSYS may update itself into a state where it can no longer operate. You may see errors like the following:

```plaintext
*** fatal error - cygheap base mismatch detected - 0x612E5408/0x612E4408. This problem is probably due to using incompatible versions of the cygwin DLL.
```

If you see errors like this, close the terminal window entirely (terminating the processes running there) and then re-open a new terminal. Re-run windows_install_prerequisites.sh (tip: use the up arrow key to see the last run command). The update process will resume after this step.
• MSYS2 is a “rolling” distribution so running the installer script may install newer packages than what is used in the prebuilt environments. If you see any errors that appear to be related to installing MSYS2 packages, please check the MSYS2-packages issues list for known issues. If you don’t see any relevant issues, please raise an IDF issue.

MSYS2 Mirrors in China

There are some (unofficial) MSYS2 mirrors inside China, which substantially improves download speeds inside China.

To add these mirrors, edit the following two MSYS2 mirrorlist files before running the setup script. The mirrorlist files can be found in the `/etc/pacman.d` directory (i.e. `c:\msys2\etc\pacman.d`).

Add these lines at the top of `mirrorlist.mingw32`:

```
Server = https://mirrors.ustc.edu.cn/msys2/mingw/i686/
Server = http://mirror.bit.edu.cn/msys2/REPOS/MINGW/i686
```

Add these lines at the top of `mirrorlist.msys`:

```
Server = http://mirrors.ustc.edu.cn/msys2/msys/$arch
Server = http://mirror.bit.edu.cn/msys2/REPOS/MSYS2/$arch
```

HTTP Proxy

You can enable an HTTP proxy for MSYS and PIP downloads by setting the `http_proxy` variable in the terminal before running the setup script:

```
export http_proxy='http://http.proxy.server:PORT'
```

Or with credentials:

```
export http_proxy='http://user:password@http.proxy.server:PORT'
```

Add this line to `/etc/profile` in the MSYS directory in order to permanently enable the proxy when using MSYS.

Alternative Setup: Just download a toolchain

If you already have an MSYS2 install or want to do things differently, you can download just the toolchain here:

**Note:** If you followed instructions *Configure Toolchain & Environment from Scratch*, you already have the toolchain and you won’t need this download.

**Important:** Just having this toolchain is *not enough* to use ESP-IDF on Windows. You will need GNU make, bash, and sed at minimum. The above environments provide all this, plus a host compiler (required for menuconfig support).

Next Steps

To carry on with development environment setup, proceed to section *Step 2. Get ESP-IDF*. 

1.16. Related Documents
Updating The Environment

When IDF is updated, sometimes new toolchains are required or new system requirements are added to the Windows MSYS2 environment.

Rather than setting up a new environment, you can update an existing Windows environment & toolchain:

- Update IDF to the new version you want to use.
- Run the `tools/windows/windows_install_prerequisites.sh` script inside IDF. This will install any new software packages that weren’t previously installed, and download and replace the toolchain with the latest version.

The script to update MSYS2 may also fail with the same errors mentioned under Troubleshooting.

If you need to support multiple IDF versions concurrently, you can have different independent MSYS2 environments in different directories. Alternatively you can download multiple toolchains and unzip these to different directories, then use the PATH environment variable to set which one is the default.

Standard Setup of Toolchain for Linux (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Install Prerequisites

To compile with ESP-IDF you need to get the following packages:

- CentOS 7:

  ```bash
  sudo yum install gcc git wget make flex bison gperf python python2-cryptography
  ```

- Ubuntu and Debian:

  ```bash
  sudo apt-get install gcc git wget make flex bison gperf python python-pip python-{}
  "setuptools python-serial python-cryptography python-future python-pyparsing python-{}
  "pyelftools libffi-dev libssl-dev
  ```

- Arch:

  ```bash
  sudo pacman -S --needed gcc git make flex bison gperf python-pyserial python-{}
  "{}cryptography python-future python-pyparsing python-pyelftools
  ```

Note: Some older Linux distributions may be missing some of the Python packages listed above (or may use pyserial version 2.x which is not supported by ESP-IDF). It is possible to install these packages via pip instead - as described in section Step 4. Install the Required Python Packages.
Toolchain Setup

ESP32 toolchain for Linux is available for download from Espressif website:

- for 64-bit Linux:
  https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_2_0-esp-2020r2-linux-amd64.tar.gz
- for 32-bit Linux:

1. Download this file, then extract it in ~/esp directory:

   - for 64-bit Linux:
     ```
     mkdir -p ~/esp
     cd ~/esp
     tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_2_0-esp-2020r2-linux-amd64.tar.gz
     ```
   - for 32-bit Linux:
     ```
     mkdir -p ~/esp
     cd ~/esp
     tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_2_0-esp-2020r2-linux-i686.tar.gz
     ```

2. The toolchain will be extracted into ~/esp/xtensa-esp32-elf/ directory.

   To use it, you will need to update your PATH environment variable in ~/.profile file. To make xtensa-esp32-elf available for all terminal sessions, add the following line to your ~/.profile file:

   ```
   export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"
   ```

   Alternatively, you may create an alias for the above command. This way you can get the toolchain only when you need it. To do this, add different line to your ~/.profile file:

   ```
   alias get_esp32='export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"'
   ```

   Then when you need the toolchain you can type get_esp32 on the command line and the toolchain will be added to your PATH.

   **Note:** If you have /bin/bash set as login shell, and both .bash_profile and .profile exist, then update .bash_profile instead. In CentOS, alias should set in .bashrc.

3. Log off and log in back to make the .profile changes effective. Run the following command to verify if PATH is correctly set:

   ```
   printenv PATH
   ```

   You are looking for similar result containing toolchain’s path at the beginning of displayed string:

   ```
   $ printenv PATH
   /home/user-name/esp/xtensa-esp32-elf/bin:/home/user-name/bin:/home/user-name/.local/bin:/usr/local/sbin:/usr/local/bin:/usr/bin:/sbin:/bin:/usr/games:/usr/ local/games:/snap/bin
   ```

   Instead of /home/user-name there should be a home path specific to your installation.
Permission issues /dev/ttyUSB0

With some Linux distributions you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32. This can be solved by adding the current user to the dialout group.

Next Steps

To carry on with development environment setup, proceed to section Step 2. Get ESP-IDF.

Related Documents

Setup Linux Toolchain from Scratch (Legacy GNU Make)

[]

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Note: Standard process for installing the toolchain is described here. See Customized Setup of Toolchain section for some of the reasons why installing the toolchain from scratch may be necessary.

Install Prerequisites

To compile with ESP-IDF you need to get the following packages:

• Ubuntu and Debian:

```
sudo apt-get install gcc git wget make libncurses-dev flex bison gperf python-ˌpython-pip ˌpython-setuptools ˌpython-serial ˌpython-cryptography python-future ˌpython-pyparsing python-pyelftools libffi-dev libssl-dev
```

• Arch:

```
sudo pacman -S --needed gcc git make ncurses flex bison gperf python-pyserial ˌpython-cryptography python-future python-pyparsing python-pyelftools
```

Note: Some older (pre-2014) Linux distributions may use pyserial version 2.x which is not supported by ESP-IDF. In this case please install a supported version via pip as it is described in section Step 4. Install the Required Python Packages.

Compile the Toolchain from Source

• Install dependencies:
  – CentOS 7:
Create the working directory and go into it:

```
mkdir -p ~/esp
cd ~/esp
```

Download crosstool-NG and build it:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2020r2
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

Build the toolchain:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

Toolchain will be built in ~/esp/crosstool-NG/builds/xtensa-esp32-elf. Follow instructions for standard setup to add the toolchain to your PATH.

**Next Steps**

To carry on with development environment setup, proceed to section Step 2. Get ESP-IDF.

**Standard Setup of Toolchain for Mac OS (Legacy GNU Make)**

1.16. Related Documents
Install Prerequisites

- install pip:
  
  ```
  sudo easy_install pip
  ```

  **Note:** pip will be used later for installing the required Python packages.

Toolchain Setup

ESP32 toolchain for macOS is available for download from Espressif website:

Download this file, then extract it in `~/esp` directory:

```
mkdir -p ~/esp
cd ~/esp
tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_2_0-esp-2020r2-macos.tar.gz
```

The toolchain will be extracted into `~/esp/xtensa-esp32-elf/` directory.

To use it, you will need to update your PATH environment variable in `~/.profile` file. To make xtensa-esp32-elf available for all terminal sessions, add the following line to your `~/.profile` file:

```
export PATH=$HOME/esp/xtensa-esp32-elf/bin:$PATH
```

Alternatively, you may create an alias for the above command. This way you can get the toolchain only when you need it. To do this, add different line to your `~/.profile` file:

```
alias get_esp32="export PATH=$HOME/esp/xtensa-esp32-elf/bin:$PATH"
```

Then when you need the toolchain you can type `get_esp32` on the command line and the toolchain will be added to your PATH.

Next Steps

To carry on with development environment setup, proceed to section Step 2. Get ESP-IDF.

Related Documents

Setup Toolchain for Mac OS from Scratch (Legacy GNU Make)
Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Note: Standard process for installing the toolchain is described here. See Customized Setup of Toolchain section for some of the reasons why installing the toolchain from scratch may be necessary.

Install Prerequisites

- install pip:

  ```bash
  sudo easy_install pip
  ```

  Note: pip will be used later for installing the required Python packages.

Compile the Toolchain from Source

- Install dependencies:
  - Install either MacPorts or homebrew package manager. MacPorts needs a full XCode installation, while homebrew only needs XCode command line tools.
  - with MacPorts:
    ```bash
    sudo port install gsed gawk binutils gperf grep gettext wget libtool autoconf
    \rightarrow automake
    ```
  - with homebrew:
    ```bash
    brew install gnu-sed gawk binutils gperftools gettext wget help2man libtool
    \rightarrow autoconf automake
    ```

Create a case-sensitive filesystem image:

```bash
hdiutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive HFS+"
```

Mount it:

```bash
hdiutil mount ~/esp/crosstool.dmg
```

Create a symlink to your work directory:

```bash
mkdir -p ~/esp
ln -s /Volumes/ctng ~/esp/ctng-volume
```

Go into the newly created directory:

```bash
cd ~/esp/ctng-volume
```

Download crosstool-NG and build it:
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2020r2
git submodule update --init
./bootstrap && ./configure --enable-local && make

Build the toolchain:

./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf

Toolchain will be built in ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf. Follow instructions for standard setup to add the toolchain to your PATH.

Next Steps

To carry on with development environment setup, proceed to section Step 2. Get ESP-IDF.

Windows | Linux | macOS

Note: This guide uses the directory ~/esp on Linux and macOS or %userprofile%\esp on Windows as an installation folder for ESP-IDF. You can use any directory, but you will need to adjust paths for the commands respectively. Keep in mind that ESP-IDF does not support spaces in paths.

Depending on your experience and preferences, you may want to customize your environment instead of using a prebuilt toolchain. To set up the system your own way go to Section Customized Setup of Toolchain (Legacy GNU Make).

Step 2. Get ESP-IDF

Besides the toolchain, you also need ESP32-specific API (software libraries and source code). They are provided by Espressif in ESP-IDF repository.

To get a local copy of ESP-IDF, navigate to your installation directory and clone the repository with git clone. Open Terminal, and run the following commands:
cd ~/esp

git clone -b v4.1 --recursive https://github.com/espressif/esp-idf.git

ESP-IDF will be downloaded into ~/esp/esp-idf.
Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

**Note:** The git clone option -b v4.1 tells git to clone the tag in the ESP-IDF repository git clone corresponding to this version of the documentation.

**Note:** As a fallback, it is also possible to download a zip file of this stable release from the Releases page. Do not download the “Source code” zip file(s) generated automatically by GitHub, they do not work with ESP-IDF.

**Note:** Do not miss the --recursive option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

cd esp-idf

git submodule update --init

### Step 3. Set Environment Variables

The toolchain uses the environment variable IDF_PATH to access the ESP-IDF directory. This variable should be set up on your computer, otherwise projects will not build.

These variables can be set temporarily (per session) or permanently. Please follow the instructions specific to Windows, Linux and macOS in Section Add IDF_PATH to User Profile (Legacy GNU Make).

### Step 4. Install the Required Python Packages

The python packages required by ESP-IDF are located in IDF_PATH/requirements.txt. You can install them by running:

```
python -m pip install --user -r $IDF_PATH/requirements.txt
```

**Note:** Please check the version of the Python interpreter that you will be using with ESP-IDF. For this, run the command python --version and depending on the result, you might want to use python3, python3.7 or similar instead of just python, e.g.:

```
python3 -m pip install --user -r $IDF_PATH/requirements.txt
```

### Step 5. Start a Project

Now you are ready to prepare your application for ESP32. You can start with get-started/hello_world project from examples directory in IDF.

Copy get-started/hello_world to the ~/esp directory:

```
1.16. Related Documents 111
```
Linux and macOS

```bash
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

Windows

```bash
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

There is a range of example projects in the examples directory in ESP-IDF. You can copy any project in the same way as presented above and run it.

It is also possible to build examples in-place, without copying them first.

**Important:** The esp-idf build system does not support spaces in the paths to either esp-idf or to projects.

---

### Step 6. Connect Your Device

Now connect your ESP32 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows:** names like `COM1`
- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu`.

If you are not sure how to check the serial port name, please refer to *Establish Serial Connection with ESP32 (Legacy GNU Make)* for full details.

**Note:** Keep the port name handy as you will need it in the next steps.

---

### Step 7. Configure

Navigate to your `hello_world` directory from *Step 5. Start a Project* and run the project configuration utility `menuconfig`.

**Linux and macOS**

```bash
cd ~/esp/hello_world
make menuconfig
```

**Windows**
cd %userprofile%\esp\hello_world
make menuconfig

If the previous steps have been done correctly, the following menu appears:

![Menu Configuration]

In the menu, navigate to *Serial flasher config* > *Default serial port* to configure the serial port, where project will be loaded to. Confirm selection by pressing enter, save configuration by selecting *Save* and then exit *menuconfig* by selecting *Exit*.

To navigate and use *menuconfig*, press the following keys:

- Arrow keys for navigation
- Enter to go into a submenu
- Esc to go up one level or exit
- ? to see a help screen. Enter key exits the help screen
- Space, or Y and N keys to enable (Yes) and disable (No) configuration items with checkboxes “[*]”
- ? while highlighting a configuration item to display help about that item
- / to find configuration items

**Attention:** If you use ESP32-DevKitC board with the ESP32-SOLO-1 module, enable single core mode (*CONFIG_FREERTOS_UNICORE*) in menuconfig before flashing examples.

**Step 8. Build and Flash**

Build and flash the project by running:

```bash
make flash
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries. After that, these binaries will be flashed onto your ESP32 board.

If there are no issues by the end of the flash process, you will see messages (below) describing progress of the loading process. Then the board will be reset and the “hello_world” application will start up.
If you’d like to use the Eclipse IDE instead of running `make`, check out the *Eclipse guide*.

**Step 9. Monitor**

To check if “hello_world” is indeed running, type `make monitor`.

This command launches the *IDF Monitor* application:

```
$ make monitor
MONITOR
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
..."n
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
...Hello world!
Restarting in 10 seconds...
I (211) cpu_start: Starting scheduler on APP CPU.
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```
To exit IDF monitor use the shortcut Ctrl+].

If IDF monitor fails shortly after the upload, or if instead of the messages above you see a random garbage similar to what is given below, your board is likely using a 26MHz crystal. Most development board designs use 40MHz, so ESP-IDF uses this frequency as a default value.

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to menuconfig.
3. Go to Component config -> ESP32-specific -> Main XTAL frequency, then change CONFIG_ESP32_XTAL_FREQ_SEL to 26MHz.
4. After that, build and flash the application again.

Note: You can combine building, flashing and monitoring into one step by running:

```
make flash monitor
```

See also IDF Monitor for handy shortcuts and more details on using IDF monitor.

That’s all that you need to get started with ESP32!

Now you are ready to try some other examples, or go straight to developing your own applications.

### Environment Variables

Some environment variables can be specified whilst calling make allowing users to **override arguments without the need to reconfigure them using** make menuconfig.

<table>
<thead>
<tr>
<th>Variables</th>
<th>Description &amp; Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESPPORT</td>
<td>Overrides the serial port used in flash and monitor.</td>
</tr>
<tr>
<td></td>
<td>Examples: <code>make flash ESPPORT=/dev/ttyUSB1, make monitor ESPPORT=COM1</code></td>
</tr>
<tr>
<td>ESPBAUD</td>
<td>Overrides the serial baud rate when flashing the ESP32.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>make flash ESPBAUD=9600</code></td>
</tr>
<tr>
<td>MONITORBAUD</td>
<td>Overrides the serial baud rate used when monitoring.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>make monitor MONITORBAUD=9600</code></td>
</tr>
</tbody>
</table>

Note: You can export environment variables (e.g. `export ESPPORT=/dev/ttyUSB1`). All subsequent calls of `make` within the same terminal session will use the exported value given that the variable is not simultaneously overridden.

### Updating ESP-IDF

You should update ESP-IDF from time to time, as newer versions fix bugs and provide new features. The simplest way to do the update is to delete the existing `esp-idf` folder and clone it again, as if performing the initial installation.
described in *Step 2. Get ESP-IDF*.

If downloading to a new path, remember to *Add IDF_PATH to User Profile (Legacy GNU Make)* so that the toolchain scripts can find ESP-IDF in its release specific location.

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

**Related Documents**

**Add IDF_PATH to User Profile (Legacy GNU Make)**

[]

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

To preserve setting of IDF_PATH environment variable between system restarts, add it to the user profile, following instructions below.

**Windows**

The user profile scripts are contained in C:/msys32/etc/profile.d/ directory. They are executed every time you open an MSYS2 window.

1. Create a new script file in C:/msys32/etc/profile.d/ directory. Name it export_idf_path.sh.
2. Identify the path to ESP-IDF directory. It is specific to your system configuration and may look something like C:\msys32\home\user-name\esp\esp-idf
3. Add the export command to the script file, e.g.:

   ```bash
   export IDF_PATH="C:/msys32/home/user-name/esp/esp-idf"
   ```

   Remember to replace back-slashes with forward-slashes in the original Windows path.
4. Save the script file.
5. Close MSYS2 window and open it again. Check if IDF_PATH is set, by typing:

   ```bash
   printenv IDF_PATH
   ```

   The path previously entered in the script file should be printed out.

If you do not like to have IDF_PATH set up permanently in user profile, you should enter it manually on opening of an MSYS2 window:

```bash
export IDF_PATH="C:/msys32/home/user-name/esp/esp-idf"
```

If you got here from section *Step 3. Set Environment Variables*, while installing s/w for ESP32 development, then go back to section *Step 5. Start a Project*. 
Linux and MacOS

Set up IDF_PATH by adding the following line to ~/.profile file:

```
export IDF_PATH=~/esp/esp-idf
```

Log off and log in back to make this change effective.

**Note:** If you have /bin/bash set as login shell, and both .bash_profile and .profile exist, then update .bash_profile instead.

Run the following command to check if IDF_PATH is set:

```
printenv IDF_PATH
```

The path previously entered in ~/.profile file (or set manually) should be printed out.

If you do not like to have IDF_PATH set up permanently, you should enter it manually in terminal window on each restart or logout:

```
export IDF_PATH=~/esp/esp-idf
```

If you got here from section *Step 3. Set Environment Variables*, while installing s/w for ESP32 development, then go back to section *Step 5. Start a Project*.

Establish Serial Connection with ESP32 (Legacy GNU Make)

[ ]

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

This section provides guidance how to establish serial connection between ESP32 and PC.

Connect ESP32 to PC

Connect the ESP32 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32 board (or external converter dongle), search for drivers in internet and install them.

Below are the links to drivers for ESP32 and other boards produced by Espressif:
Development Board | USB Driver | Remarks
--- | --- | ---
ESP32-DevKitC | CP210x | 
ESP32-LyraT | CP210x | 
ESP32-LyraTD-MSC | CP210x | 
ESP32-PICO-KIT | CP210x | 
ESP-WROVER-KIT | CP210x | 
ESP32Demo Board | FTDI | 
ESP-Prog | FTDI | Programmer board (w/o ESP32)
ESP32-MeshKit-Sense | n/a | Use with ESP-Prog
ESP32-Sense Kit | n/a | Use with ESP-Prog

- **CP210x**: CP210x USB to UART Bridge VCP Drivers
- **FTDI**: FTDI Virtual COM Port Drivers

The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with and operating system and automatically installed upon connecting one of the listed boards to the PC.

**Check port on Windows**

Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

**Check port on Linux and MacOS**

To check the device name for the serial port of your ESP32 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

**Linux**

```
ls /dev/tty*
```

**MacOS**

```
ls /dev/cu.*
```

**Adding user to dialout on Linux**

The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to `dialout` group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.
Fig. 38: USB to UART bridge of ESP32-DevKitC in Windows Device Manager
Fig. 39: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
Verify serial connection

Now verify that the serial connection is operational. You can do this using a serial terminal program. In this example we will use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

![Fig. 40: Setting Serial Communication in PuTTY on Windows](image)

Then open serial port in terminal and check, if you see any log printed out by ESP32. The log contents will depend on application loaded to ESP32. An example log by ESP32 is shown below.

```
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configspi: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
```

(continues on next page)
Fig. 41: Setting Serial Communication in PuTTY on Linux
If you see some legible log, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the [esptool documentation](https://docs.espressif.com/projects/esp-idf/en/dev/using-esptool.html) for more details.

**Note:** Close serial terminal after verification that communication is working. In next step we are going to use another application to upload ESP32. This application will not be able to access serial port while it is open in terminal.

If you got here from section *Step 6. Connect Your Device* when installing s/w for ESP32 development, then go back to section *Step 7. Configure.*

### Build and Flash with Make (Legacy GNU Make)

[]

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

#### Finding a project

As well as the `esp-idf-template` project, ESP-IDF comes with some example projects on github in the `examples` directory.

Once you’ve found the project you want to work with, change to its directory and you can configure and build it.

#### Configuring your project

```
make menuconfig
```

#### Compiling your project

```
make all
```

... will compile app, bootloader and generate a partition table based on the config.
Flashing your project

When `make all` finishes, it will print a command line to use `esptool.py` to flash the chip. However you can also do this from `make` by running:

```
make flash
```

This will flash the entire project (app, bootloader and partition table) to a new chip. Also if partition table has `ota_data` then this command will flash a initial `ota_data`. It allows to run the newly loaded app from a factory partition (or the first OTA partition, if factory partition is not present). The settings for serial port flashing can be configured with `make menuconfig`.

You don’t need to run `make all` before running `make flash`, `make flash` will automatically rebuild anything which needs it.

Compiling & Flashing Just the App

After the initial flash, you may just want to build and flash just your app, not the bootloader and partition table:

- `make app` - build just the app.
- `make app-flash` - flash just the app.

`make app-flash` will automatically rebuild the app if it needs it.

There’s no downside to reflashing the bootloader and partition table each time, if they haven’t changed.

The Partition Table

Once you’ve compiled your project, the “build” directory will contain a binary file with a name like “my_app.bin”. This is an ESP32 image binary that can be loaded by the bootloader.

A single ESP32’s flash can contain multiple apps, as well as many kinds of data (calibration data, filesystems, parameter storage, etc). For this reason, a partition table is flashed to offset 0x8000 in the flash.

Each entry in the partition table has a name (label), type (app, data, or something else), subtype and the offset in flash where the partition is loaded.

The simplest way to use the partition table is to `make menuconfig` and choose one of the simple predefined partition tables:

- “Single factory app, no OTA”
- “Factory app, two OTA definitions”

In both cases the factory app is flashed at offset 0x10000. If you `make partition_table` then it will print a summary of the partition table.

For more details about partition tables and how to create custom variations, view the documentation.

Build and Flash with Eclipse IDE (Legacy GNU Make)

[]

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.
Installing Eclipse IDE

The Eclipse IDE gives you a graphical integrated development environment for writing, compiling and debugging ESP-IDF projects.

- Start by installing the esp-idf for your platform (see files in this directory with steps for Windows, OS X, Linux).
- We suggest building a project from the command line first, to get a feel for how that process works. You also need to use the command line to configure your esp-idf project (via `make menuconfig`), this is not currently supported inside Eclipse.
- Download the Eclipse Installer for your platform from [eclipse.org](http://eclipse.org).
- When running the Eclipse Installer, choose “Eclipse for C/C++ Development” (in other places you’ll see this referred to as CDT.)

Setting up Eclipse

Once your new Eclipse installation launches, follow these steps:

Import New Project

- Eclipse makes use of the Makefile support in ESP-IDF. This means you need to start by creating an ESP-IDF project. You can use the idf-template project from github, or open one of the examples in the esp-idf examples subdirectory.
- Once Eclipse is running, choose File -> Import . . .
- In the dialog that pops up, choose “C/C++” -> “Existing Code as Makefile Project” and click Next.
- On the next page, enter “Existing Code Location” to be the directory of your IDF project. Don’t specify the path to the ESP-IDF directory itself (that comes later). The directory you specify should contain a file named “Makefile” (the project Makefile).
- On the same page, under “Toolchain for Indexer Settings” choose “Cross GCC”. Then click Finish.

Project Properties

- The new project will appear under Project Explorer. Right-click the project and choose Properties from the context menu.
- Click on the “Environment” properties page under “C/C++ Build”. Click “Add…” and enter name `BATCH_BUILD` and value 1.
- Click “Add…” again, and enter name `IDF_PATH`. The value should be the full path where ESP-IDF is installed. Windows users can copy the `IDF_PATH` from windows explorer.
- Edit the `PATH` environment variable. Keep the current value, and append the path to the Xtensa toolchain installed as part of IDF setup, if this is not already listed on the PATH. A typical path to the toolchain looks like `/home/user-name/esp/xtensa-esp32-elf/bin`. Note that you need to add a colon `:` before the appended path. Windows users will need to prepend `C:\msys32\mingw32\bin;C:\msys32\opt\xtensa-esp32-elf\bin;C:\msys32\usr\bin` to `PATH` environment variable (If you installed msys32 to a different directory then you’ll need to change these paths to match).
- On macOS, add a `PYTHONPATH` environment variable and set it to `/Library/Frameworks/Python.framework/Versions/2.7/lib/python2.7/site-packages`. This is so that the system Python, which has pyserial installed as part of the setup steps, overrides any built-in Eclipse Python.
**ADDITIONAL NOTE**: If either the IDF_PATH directory or the project directory is located outside `C:\msys32\home` directory, you will have to give custom build command in C/C++ Build properties as: `python $(IDF_PATH)/tools/windows/eclipse_make.py` (Please note that the build time may get significantly increased by this method.)

Navigate to “C/C++ General” -> “Preprocessor Include Paths” property page:

- Click the “Providers” tab
- In the list of providers, click “CDT Cross GCC Built-in Compiler Settings”. Change “Command to get compiler specs” to `xtensa-esp32-elf-gcc $({FLAGS}) -std=c++11 -E -P -v -dD "$(INPUTS)"`.  
- In the list of providers, click “CDT GCC Build Output Parser” and change the “Compiler command pattern” to `xtensa-esp32-elf-(gcc|g++|c++|cc|cpp|clang)`

Navigate to “C/C++ General” -> “Indexer” property page:

- Check “Enable project specific settings” to enable the rest of the settings on this page.
- Uncheck “Allow heuristic resolution of includes”. When this option is enabled Eclipse sometimes fails to find correct header directories.

Navigate to “C/C++ Build” -> “Behavior” property page:

- Check “Enable parallel build” to enable multiple build jobs in parallel.

### Building in Eclipse

Before your project is first built, Eclipse may show a lot of errors and warnings about undefined values. This is because some source files are automatically generated as part of the esp-idf build process. These errors and warnings will go away after you build the project.

- Click OK to close the Properties dialog in Eclipse.
- Outside Eclipse, open a command line prompt. Navigate to your project directory, and run `make menuconfig` to configure your project’s esp-idf settings. This step currently has to be run outside Eclipse.

*If you try to build without running a configuration step first, esp-idf will prompt for configuration on the command line - but Eclipse is not able to deal with this, so the build will hang or fail.*

- Back in Eclipse, choose Project -> Build to build your project.

**TIP**: If your project had already been built outside Eclipse, you may need to do a Project -> Clean before choosing Project -> Build. This is so Eclipse can see the compiler arguments for all source files. It uses these to determine the header include paths.

### Flash from Eclipse

You can integrate the “make flash” target into your Eclipse project to flash using `esptool.py` from the Eclipse UI:

- Right-click your project in Project Explorer (important to make sure you select the project, not a directory in the project, or Eclipse may find the wrong Makefile.)
- Select Build Targets -> Create... from the context menu.
- Type “flash” as the target name. Leave the other options as their defaults.
- Now you can use Project -> Build Target -> Build (Shift+F9) to build the custom flash target, which will compile and flash the project.
Note that you will need to use “make menuconfig” to set the serial port and other config options for flashing. “make menuconfig” still requires a command line terminal (see the instructions for your platform.)

Follow the same steps to add bootloader and partition_table targets, if necessary.

**Customized Setup of Toolchain (Legacy GNU Make)**

Instead of downloading binary toolchain from Espressif website (see *Step 1. Set up the Toolchain*) you may build the toolchain yourself.

---

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

---

If you can’t think of a reason why you need to build it yourself, then probably it’s better to stick with the binary version. However, here are some of the reasons why you might want to compile it from source:

- if you want to customize toolchain build configuration
- if you want to use a different GCC version (such as 4.8.5)
- if you want to hack gcc or newlib or libstdc++
- if you are curious and/or have time to spare
- if you don’t trust binaries downloaded from the Internet

In any case, here are the instructions to compile the toolchain yourself.
2.1 Bluetooth API

2.1.1 Controller && VHCI

Overview

Instructions

Application Example

Check bluetooth/bluedroid/hci folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE HCI command for BLE advertising - bluetooth/bluedroid/hci/controller_vhci_ble_adv.

API Reference

Header File

- bt/include/esp_bt.h
Functions

`esp_err_t esp_ble_tx_power_set (esp_ble_power_type_t power_type, esp_power_level_t power_level)`
Set BLE TX power. Connection Tx power should only be set after connection created.

**Return** ESP_OK - success, other - failed

**Parameters**
- `power_type`: The type of which tx power, could set Advertising/Connection/Default and etc
- `power_level`: Power level(index) corresponding to absolute value(dbm)

`esp_power_level_t esp_ble_tx_power_get (esp_ble_power_type_t power_type)`
Get BLE TX power. Connection Tx power should only beget after connection created.

**Return** >= 0 - Power level, < 0 - Invalid

**Parameters**
- `power_type`: The type of which tx power, could set Advertising/Connection/Default and etc

`esp_err_t esp_bredr_tx_power_set (esp_power_level_t min_power_level, esp_power_level_t max_power_level)`
Set BR/EDR TX power. BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after esp_bt_controller_enable and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is ESP_PWR_LVL_N0, and maximum power level is ESP_PWR_LVL_P3.

**Return** ESP_OK - success, other - failed

**Parameters**
- `min_power_level`: The minimum power level
- `max_power_level`: The maximum power level

`esp_err_t esp_bredr_tx_power_get (esp_power_level_t *min_power_level, esp_power_level_t *max_power_level)`
Get BR/EDR TX power. If the argument is not NULL, then store the corresponding value.

**Return** ESP_OK - success, other - failed

**Parameters**
- `min_power_level`: The minimum power level
- `max_power_level`: The maximum power level

`esp_err_t esp_bredr_sco_datapath_set (esp_sco_data_path_t data_path)`
Set default SCO data path. Should be called after controller is enabled, and before (e)SCO link is established.

**Return** ESP_OK - success, other - failed

**Parameters**
- `data_path`: SCO data path
esp_err_t esp_bt_controller_init (esp_bt_controller_config_t *cfg)
Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

Return ESP_OK - success, other - failed

Parameters
- cfg: Initial configuration of BT controller. Different from previous version, there's a mode and some connection configuration in “cfg” to configure controller work mode and allocate the resource which is needed.

esp_err_t esp_bt_controller_deinit (void)
De-initialize BT controller to free resource and delete task.
This function should be called only once, after any other BT functions are called.

Return ESP_OK - success, other - failed

esp_err_t esp_bt_controller_enable (esp_bt_mode_t mode)
Enable BT controller. Due to a known issue, you cannot call esp_bt_controller_enable() a second time to change the controller mode dynamically. To change controller mode, call esp_bt_controller_disable() and then call esp_bt_controller_enable() with the new mode.

Return ESP_OK - success, other - failed

Parameters
- mode: the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “cfg” of esp_bt_controller_init().

esp_err_t esp_bt_controller_disable (void)
Disable BT controller.

Return ESP_OK - success, other - failed

esp_bt_controller_status_t esp_bt_controller_get_status (void)
Get BT controller is initialised/de-initialised/enabled/disabled.

Return status value

bool esp_vhci_host_check_send_available (void)
esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.

Return true for ready to send, false means cannot send packet

void esp_vhci_host_send_packet (uint8_t *data, uint16_t len)
esp_vhci_host_send_packet host send packet to controller
Should not call this function from within a critical section or when the scheduler is suspended.

Parameters
- data: the packet point
- len: the packet length

2.1. Bluetooth API
esp_err_t esp_vhci_host_register_callback(const esp_vhci_host_callback_t *callback)

esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback structure.

Return ESP_OK - success, ESP_FAIL - failed

Parameters

- callback: esp_vhci_host_callback type variable

esp_err_t esp_bt_controller_mem_release(esp_bt_mode_t mode)

esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after esp_bt_controller_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp_bt_mem_release() function

Return ESP_OK - success, other - failed

Parameters

- mode: the mode want to release memory

esp_err_t esp_bt_mem_release(esp_bt_mode_t mode)

esp_bt_mem_release release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call esp_bt_mem_release(ESP_BT_MODE_BTDM) before esp_bt_controller_init or after esp_bt_controller_deinit.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation”. In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);

**Note** In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP_BT_MODE_BTDM as controller is dual mode.

**Return** ESP_OK - success, other - failed

**Parameters**
- **mode**: the mode whose memory is to be released

```c
esp_err_t esp_bt_sleep_enable(void)
```

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG_BTDM_MODEM_SLEEP is set and “ORIG mode” is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “esp_bt_controller_wakeup_request”.

**Return**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_bt_sleep_disable(void)
```

disable bluetooth modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

If esp_bt_sleep_disable() is called, bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake up if it is dormant then. In this case, esp_bt_controller_wakeup_request() can be used to shorten the time for wakeup.

**Return**
- ESP_OK : success
- other : failed

```c
bool esp_bt_controller_is_sleeping(void)
```

to check whether bluetooth controller is sleeping at the instant, if modem sleep is enabled

Note that this function shall not be invoked before esp_bt_controller_enable() This function is supposed to be used ORIG mode of modem sleep

**Return** true if in modem sleep state, false otherwise
void esp_bt_controller_wakeup_request (void)
request controller to wakeup from sleeping state during sleep mode

Note that this function shall not be invoked before esp_bt_controller_enable() Note that this function is supposed to be used ORIG mode of modem sleep Note that after this request, bluetooth controller may again enter sleep as long as the modem sleep is enabled

Profiling shows that it takes several milliseconds to wakeup from modem sleep after this request. Generally it takes longer if 32kHz XTAL is used than the main XTAL, due to the lower frequency of the former as the bluetooth low power clock source.

esp_err_t esp_ble_scan_duplicate_list_flush (void)
Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

Return
  • ESP_OK : success
  • other : failed

Structures

struct esp_bt_controller_config_t
  Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

Public Members

uint16_t controller_task_stack_size
  Bluetooth controller task stack size

uint8_t controller_task_prio
  Bluetooth controller task priority

uint8_t hci_uart_no
  If use UART1/2 as HCI IO interface, indicate UART number

uint32_t hci_uart_baudrate
  If use UART1/2 as HCI IO interface, indicate UART baudrate

uint8_t scan_duplicate_mode
  scan duplicate mode

uint8_t scan_duplicate_type
  scan duplicate type

uint16_t normal_adv_size
  Normal adv size for scan duplicate

uint16_t mesh_adv_size
  Mesh adv size for scan duplicate

uint16_t send_adv_reserved_size
  Controller minimum memory value

uint32_t controller_debug_flag
  Controller debug log flag
uint8_t mode
    Controller mode: BR/EDR, BLE or Dual Mode

dt uint8_t ble_max_conn
    BLE maximum connection numbers

dt uint8_t bt_max_acl_conn
    BR/EDR maximum ACL connection numbers

dt uint8_t bt_sco_datapath
    SCO data path, i.e. HCI or PCM module

dt bool auto_latency
    BLE auto latency, used to enhance classic BT performance

uint8_t bt_max_sync_conn
    BR/EDR maximum ACL connection numbers. Effective in menuconfig

dt uint8_t ble_sca
    BLE low power crystal accuracy index

dt uint32_t magic
    Magic number

struct esp_vhci_host_callback
    esp_vhci_host_callback used for vhci call host function to notify what host need to do

Public Members

dt void (*notify_host_send_available) (void)
    callback used to notify that the host can send packet to controller

dt int (*notify_host_recv) (uint8_t *data, uint16_t len)
    callback used to notify that the controller has a packet to send to the host

Macros

ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL

BT_CONTROLLER_INIT_CONFIG_DEFAULT() 

Type Definitions

typedef struct esp_vhci_host_callback esp_vhci_host_callback_t
    esp_vhci_host_callback used for vhci call host function to notify what host need to do

Enumerations

enum esp_bt_mode_t
    Bluetooth mode for controller enable/disable.

    Values:

    ESP_BT_MODE_IDLE = 0x00
        Bluetooth is not running

2.1. Bluetooth API
ESP_BT_MODE_BLE = 0x01
Run BLE mode

ESP_BT_MODE_CLASSIC_BT = 0x02
Run Classic BT mode

ESP_BT_MODE_BTDM = 0x03
Run dual mode

enum [anonymous]
BLE sleep clock accuracy (SCA), values for ble_sca field in esp_bt_controller_config_t, currently only ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.

Values:
ESP_BLE_SCA_500PPM = 0
BLE SCA at 500ppm

ESP_BLE_SCA_250PPM
BLE SCA at 250ppm

ESP_BLE_SCA_150PPM
BLE SCA at 150ppm

ESP_BLE_SCA_100PPM
BLE SCA at 100ppm

ESP_BLE_SCA_75PPM
BLE SCA at 75ppm

ESP_BLE_SCA_50PPM
BLE SCA at 50ppm

ESP_BLE_SCA_30PPM
BLE SCA at 30ppm

ESP_BLE_SCA_20PPM
BLE SCA at 20ppm

enum esp_bt_controller_status_t
Bluetooth controller enable/disable/initialised/de-initialised status.

Values:
ESP_BT_CONTROLLER_STATUS_IDLE = 0
ESP_BT_CONTROLLER_STATUS_INITED
ESP_BT_CONTROLLER_STATUS_ENABLED
ESP_BT_CONTROLLER_STATUS_NUM

enum esp_ble_power_type_t
BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. ESP_BLE_PWR_TYPE_ADV : for advertising.scan response. ESP_BLE_PWR_TYPE_SCAN : for scan. ESP_BLE_PWR_TYPE_DEFAULT : if each connection’s TX power is not set, it will use this default value. if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.

Values:
ESP_BLE_PWR_TYPE_CONN_HDL0 = 0
For connection handle 0
```c
ESP_BLE_PWR_TYPE_CONN_HDL1 = 1
    For connection handle 1
ESP_BLE_PWR_TYPE_CONN_HDL2 = 2
    For connection handle 2
ESP_BLE_PWR_TYPE_CONN_HDL3 = 3
    For connection handle 3
ESP_BLE_PWR_TYPE_CONN_HDL4 = 4
    For connection handle 4
ESP_BLE_PWR_TYPE_CONN_HDL5 = 5
    For connection handle 5
ESP_BLE_PWR_TYPE_CONN_HDL6 = 6
    For connection handle 6
ESP_BLE_PWR_TYPE_CONN_HDL7 = 7
    For connection handle 7
ESP_BLE_PWR_TYPE_CONN_HDL8 = 8
    For connection handle 8
ESP_BLE_PWR_TYPE_ADV = 9
    For advertising
ESP_BLE_PWR_TYPE_SCAN = 10
    For scan
ESP_BLE_PWR_TYPE_DEFAULT = 11
    For default, if not set other, it will use default value
ESP_BLE_PWR_TYPE_NUM = 12
    TYPE numbers

enum esp_power_level_t
    Bluetooth TX power level(index), it’s just a index corresponding to power(dbm).
    Values:
ESP_PWR_LVL_N12 = 0
    Corresponding to -12dbm
ESP_PWR_LVL_N9 = 1
    Corresponding to -9dbm
ESP_PWR_LVL_N6 = 2
    Corresponding to -6dbm
ESP_PWR_LVL_N3 = 3
    Corresponding to -3dbm
ESP_PWR_LVL_N0 = 4
    Corresponding to 0dbm
ESP_PWR_LVL_P3 = 5
    Corresponding to +3dbm
ESP_PWR_LVL_P6 = 6
    Corresponding to +6dbm
ESP_PWR_LVL_P9 = 7
    Corresponding to +9dbm
```

2.1. Bluetooth API
ESP_PWR_LVL_N14 = ESP_PWR_LVL_N12
Backward compatibility! Setting to -14dbm will actually result to -12dbm

ESP_PWR_LVL_N11 = ESP_PWR_LVL_N9
Backward compatibility! Setting to -11dbm will actually result to -9dbm

ESP_PWR_LVL_N8 = ESP_PWR_LVL_N6
Backward compatibility! Setting to -8dbm will actually result to -6dbm

ESP_PWR_LVL_N5 = ESP_PWR_LVL_N3
Backward compatibility! Setting to -5dbm will actually result to -3dbm

ESP_PWR_LVL_N2 = ESP_PWR_LVL_N0
Backward compatibility! Setting to -2dbm will actually result to 0dbm

ESP_PWR_LVL_P1 = ESP_PWR_LVL_P3
Backward compatibility! Setting to +1dbm will actually result to +3dbm

ESP_PWR_LVL_P4 = ESP_PWR_LVL_P6
Backward compatibility! Setting to +4dbm will actually result to +6dbm

ESP_PWR_LVL_P7 = ESP_PWR_LVL_P9
Backward compatibility! Setting to +7dbm will actually result to +9dbm

```c
enum esp_sco_data_path_t
```
Bluetooth audio data transport path.
```c
Values:
```
```c
ESP_SCO_DATA_PATH_HCI = 0
data over HCI transport
```
```c
ESP_SCO_DATA_PATH_PCM = 1
data over PCM interface
```

    relate to ESP_BLE_CONN_SUP_TOUT_MAX in stack/btm_ble_api.h
ESP_BLE_CONN_PARAM_UNDEF
ESP_BLE_SCAN_PARAM_UNDEF
ESP_BLE_IS_VALID_PARAM (x, min, max)
    Check the param is valid or not.
ESP_UUID_LEN_16
ESP_UUID_LEN_32
ESP_UUID_LEN_128
ESP_BD_ADDR_LEN
    Bluetooth address length.
ESP_BLE_ENC_KEY_MASK
    Used to exchange the encryption key in the init key & response key.
ESP_BLE_ID_KEY_MASK
    Used to exchange the IRK key in the init key & response key.

2.1. Bluetooth API
ESP_BLE_CSR_KEY_MASK
Used to exchange the CSRK key in the init key & response key.

ESP_BLE_LINK_KEY_MASK
Used to exchange the link key (this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

ESP_APP_ID_MIN
Minimum of the application id.

ESP_APP_ID_MAX
Maximum of the application id.

ESP_BD_ADDR_STR
ESP_BD_ADDR_HEX(addr)

Type Definitions

typedef uint8_t esp_bt_octet16_t[ESP_BT_OCTET16_LEN]
typedef uint8_t esp_bt_octet8_t[ESP_BT_OCTET8_LEN]

Instructions
API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_bt_main.h

Functions

- `esp_bluedroid_status_t esp_bluedroid_get_status (void)`
  Get bluetooth stack status.
  
  **Return** Bluetooth stack status

- `esp_err_t esp_bluedroid_enable (void)`
  Enable bluetooth, must after esp_bluedroid_init()
  
  **Return**
  - ESP_OK : Succeed
  - Other : Failed

- `esp_err_t esp_bluedroid_disable (void)`
  Disable bluetooth, must prior to esp_bluedroid_deinit()
  
  **Return**
  - ESP_OK : Succeed
  - Other : Failed

- `esp_err_t esp_bluedroid_init (void)`
  Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.
  
  **Return**
  - ESP_OK : Succeed
  - Other : Failed

- `esp_err_t esp_bluedroid_deinit (void)`
  Deinit and free the resource for bluetooth, must be after every bluetooth stuff.
  
  **Return**
  - ESP_OK : Succeed
  - Other : Failed

Enumerations

- `enum esp_bluedroid_status_t` Bluetooth stack status type, to indicate whether the bluetooth stack is ready.
  
  **Values:**
ESP_BLUEDROID_STATUS_UNINITIALIZED = 0
Bluetooth not initialized

ESP_BLUEDROID_STATUS_INITIALIZED
Bluetooth initialized but not enabled

ESP_BLUEDROID_STATUS_ENABLED
Bluetooth initialized and enabled

BT DEVICE APIs

Overview

Bluetooth device reference APIs.

Instructions

Application Example

Instructions

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_bt_device.h

Functions

const uint8_t *esp_bt_dev_get_address (void)
Get bluetooth device address. Must use after “esp_bluedroid_enable”.

Return  bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

esp_err_t esp_bt_dev_set_device_name(const char *name)
Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully. A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

Return

- ESP_OK : Succeed
- ESP_ERR_INVALID_ARG : if name is NULL pointer or empty, or string length out of limit
- ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
- ESP_FAIL : others

Parameters

- name: device name to be set
2.1.3 BT LE

GAP API

Overview

Instructions

Application Example

Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_client
  - GATT Security Client Example Walkthrough

- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_server
  - GATT Security Server Example Walkthrough

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_gap_ble_api.h

Functions

```c
esp_err_t esp_ble_gap_register_callback(esp_gap_ble_cb_t callback)
```

This function is called to occur gap event, such as scan result.

- **Return**
  - ESP_OK : success
  - other : failed

- **Parameters**
  - callback: callback function

```c
esp_err_t esp_ble_gap_config_adv_data(esp_ble_adv_data_t *adv_data)
```

This function is called to override the BTA default ADV parameters.

- **Return**
  - ESP_OK : success
  - other : failed

- **Parameters**
• `adv_data`: Pointer to User defined ADV data structure. This memory space can not be freed until callback of config_adv_data is received.

```c
esp_err_t esp_ble_gap_set_scan_params (esp_ble_scan_params_t *scan_params)
```

This function is called to set scan parameters.

**Return**

- `ESP_OK`: success
- `other`: failed

**Parameters**

- `scan_params`: Pointer to User defined scan_params data structure. This memory space can not be freed until callback of set_scan_params

```c
esp_err_t esp_ble_gap_start_scanning (uint32_t duration)
```

This procedure keep the device scanning the peer device which advertising on the air.

**Return**

- `ESP_OK`: success
- `other`: failed

**Parameters**

- `duration`: Keeping the scanning time, the unit is second.

```c
esp_err_t esp_ble_gap_stop_scanning (void)
```

This function call to stop the device scanning the peer device which advertising on the air.

**Return**

- `ESP_OK`: success
- `other`: failed

```c
esp_err_t esp_ble_gap_start_advertising (esp_ble_adv_params_t *adv_params)
```

This function is called to start advertising.

**Return**

- `ESP_OK`: success
- `other`: failed

**Parameters**

- `adv_params`: pointer to User defined adv_params data structure.

```c
esp_err_t esp_ble_gap_stop_advertising (void)
```

This function is called to stop advertising.

**Return**

- `ESP_OK`: success
- `other`: failed
esp_err_t esp_ble_gap_update_conn_params(esp_ble_conn_update_params_t *params)
Update connection parameters, can only be used when connection is up.

Return

• ESP_OK : success
• other : failed

Parameters

• params: - connection update parameters

esp_err_t esp_ble_gap_set_pkt_data_len(esp_bd_addr_t remote_device, uint16_t tx_data_length)
This function is to set maximum LE data packet size.

Return

• ESP_OK : success
• other : failed

esp_err_t esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)
This function sets the random address for the application.

Return

• ESP_OK : success
• other : failed

Parameters

• rand_addr: the random address which should be setting

esp_err_t esp_ble_gap_clear_rand_addr(void)
This function clears the random address for the application.

Return

• ESP_OK : success
• other : failed

esp_err_t esp_ble_gap_config_local_privacy(bool privacy_enable)
Enable/disable privacy on the local device.

Return

• ESP_OK : success
• other : failed

Parameters

• privacy_enable: - enable/disable privacy on remote device.

esp_err_t esp_ble_gap_config_local_icon(uint16_t icon)
set local gap appearance icon

Return
• ESP_OK: success
• other: failed

Parameters
• icon: External appearance value, these values are defined by the Bluetooth SIG, please refer to https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic.gap.appearance.xml

`esp_err_t esp_ble_gap_update_whitelist` (bool add_remove, `esp_bd_addr_t` remote_bda, `esp_ble_wl_addr_type_t` wl_addr_type)
Add or remove device from white list.

Return
• ESP_OK: success
• other: failed

Parameters
• add_remove: the value is true if added the ble device to the white list, and false remove to the white list.
• remote_bda: the remote device address add/remove from the white list.
• wl_addr_type: whitelist address type

`esp_err_t esp_ble_gap_get_whitelist_size` (uint16_t *length)
Get the whitelist size in the controller.

Return
• ESP_OK: success
• other: failed

Parameters
• length: the white list length.

`esp_err_t esp_ble_gap_set_prefer_conn_params` (esp_bd_addr_t bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)
This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

Return
• ESP_OK: success
• other: failed

Parameters
• bd_addr: BD address of the peripheral
• min_conn_int: minimum preferred connection interval
• max_conn_int: maximum preferred connection interval
• slave_latency: preferred slave latency
• supervision_tout: preferred supervision timeout
esp_err_t esp_ble_gap_set_device_name(const char *name)
Set device name to the local device.

Return
• ESP_OK : success
• other : failed

Parameters
• name: - device name.

esp_err_t esp_ble_gap_get_local_used_addr(esp_bd_addr_t local_used_addr, uint8_t *addr_type)
This function is called to get local used address and address type. uint8_t *esp_bt_dev_get_address(void) get the public address.

Return - ESP_OK : success
• other : failed

Parameters
• local_used_addr: - current local used ble address (six bytes)
• addr_type: - ble address type

uint8_t *esp_ble_resolve_adv_data(uint8_t *adv_data, uint8_t type, uint8_t *length)
This function is called to get ADV data for a specific type.

Return pointer of ADV data

Parameters
• adv_data: - pointer of ADV data which to be resolved
• type: - finding ADV data type
• length: - return the length of ADV data not including type

esp_err_t esp_ble_gap_config_adv_data_raw(uint8_t *raw_data, uint32_t raw_data_len)
This function is called to set raw advertising data. User need to fill ADV data by self.

Return
• ESP_OK : success
• other : failed

Parameters
• raw_data: : raw advertising data
• raw_data_len: : raw advertising data length , less than 31 bytes

esp_err_t esp_ble_gap_config_scan_rsp_data_raw(uint8_t *raw_data, uint32_t raw_data_len)
This function is called to set raw scan response data. User need to fill scan response data by self.

Return
• ESP_OK : success
• other : failed
Parameters

- `raw_data`: raw scan response data
- `raw_data_len`: raw scan response data length, less than 31 bytes

```c
esp_err_t esp_ble_gap_read_rssi(esp_bd_addr_t remote_addr)
```

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- `remote_addr`: The remote connection device address.

```c
esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type,
                                                      esp_duplicate_info_t device_info)
```

This function is called to add a device info into the duplicate scan exceptional list.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- `type`: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.
- `device_info`: the device information.

```c
esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type,
                                                               esp_duplicate_info_t device_info)
```

This function is called to remove a device info from the duplicate scan exceptional list.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- `type`: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.
- `device_info`: the device information.
esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list (esp_duplicate_scan_exceptional_list_type_t list_type)

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

Return
  • ESP_OK : success
  • other : failed

Parameters
  • list_type: duplicate scan exceptional list type, the value can be one or more of esp_duplicate_scan_exceptional_list_type_t.

esp_err_t esp_ble_gap_set_security_param (esp_ble_sm_param_t param_type, void *value, uint8_t len)

Set a GAP security parameter value. Overrides the default value.

Return - ESP_OK : success
  • other : failed

Parameters
  • param_type: the type of the param which to be set
  • value: the param value
  • len: the length of the param value

esp_err_t esp_ble_gap_security_rsp (esp_bd_addr_t bd_addr, bool accept)

Grant security request access.

Return - ESP_OK : success
  • other : failed

Parameters
  • bd_addr: BD address of the peer
  • accept: accept the security request or not

esp_err_t esp_ble_set_encryption (esp_bd_addr_t bd_addr, esp_ble_sec_act_t sec_act)

Set a gap parameter value. Use this function to change the default GAP parameter values.

Return - ESP_OK : success
  • other : failed

Parameters
  • bd_addr: the address of the peer device need to encryption
  • sec_act: This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

esp_err_t esp_ble_passkey_reply (esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)

Reply the key value to the peer device in the legacy connection stage.

Return - ESP_OK : success
esp_err_t esp_ble_confirm_reply (esp_bd_addr_t bd_addr, bool accept)

Reply the confirm value to the peer device in the secure connection stage.

Return - ESP_OK : success
  • other : failed

Parameters
  • bd_addr: : BD address of the peer
  • accept: : passkey entry successful or declined.
  • passkey: : passkey value, must be a 6 digit number, can be lead by 0.

esp_err_t esp_ble_remove_bond_device (esp_bd_addr_t bd_addr)

Removes a device from the security database list of peer device. It manages unpairing event while connected.

Return - ESP_OK : success
  • other : failed

Parameters
  • bd_addr: : BD address of the peer device

int esp_ble_get_bond_device_num (void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Return - >= 0 : bonded devices number.
  • ESP_FAIL : failed

esp_err_t esp_ble_get_bond_device_list (int *dev_num, esp_ble_bond_dev_t *dev_list)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

Return - ESP_OK : success
  • other : failed

Parameters
  • dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
  • dev_list: an array(buffer) of esp_ble_bond_dev_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

esp_err_t esp_ble_oob_req_reply (esp_bd_addr_t bd_addr, uint8_t *TK, uint8_t *len)

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

Return - ESP_OK : success
esp_err_t esp_ble_gap_disconnect (esp_bd_addr_t remote_device)

This function is to disconnect the physical connection of the peer device. gattc may have multiple virtual
GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t
conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections,
it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) discon-
nect the physical connection directly.

Return - ESP_OK : success
• other : failed

Parameters
• remote_device: : BD address of the peer device

esp_err_t esp_ble_get_current_conn_params (esp_bd_addr_t bd_addr, esp_gap_conn_params_t
*conn_params)

This function is called to read the connection parameters information of the device.

Return - ESP_OK : success
• other : failed

Parameters
• bd_addr: BD address of the peer device.
• conn_params: the connection parameters information

esp_err_t esp_gap_ble_set_channels (esp_gap_ble_channels channels)

BLE set channels.

Return - ESP_OK : success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• other : failed

Parameters
• channels: : The n th such field (in the range 0 to 36) contains the value for the link layer channel
index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are
reserved and shall be set to 0. At least one channel shall be marked as unknown.

Unions

Owner bluetooth device address type

**esp_bd_addr_t** peer_addr  
Peer device bluetooth device address

**esp_ble_addr_type_t** peer_addr_type  
Peer device bluetooth device address type, only support public address type and random address type

**esp_ble_adv_channel_t** channel_map  
Advertising channel map

**esp_ble_adv_filter_t** adv_filter_policy  
Advertising filter policy

**struct esp_ble_adv_data_t**  
Advertising data content, according to “Supplement to the Bluetooth Core Specification”.
Public Members

bool set_scan_rsp
Set this advertising data as scan response or not

bool include_name
Advertising data include device name or not

bool include_txpower
Advertising data include TX power

int min_interval
Advertising data show slave preferred connection min interval. The connection interval in the following manner: connIntervalmin = Conn_Interval_Min * 1.25 ms Conn_Interval_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int max_interval
Advertising data show slave preferred connection max interval. The connection interval in the following manner: connIntervalmax = Conn_Interval_Max * 1.25 ms Conn_Interval_Max range: 0x0006 to 0x0C80 Conn_Interval_Max shall be equal to or greater than the Conn_Interval_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int appearance
External appearance of device

uint16_t manufacturer_len
Manufacturer data length

uint8_t * p_manufacturer_data
Manufacturer data point

uint16_t service_data_len
Service data length

uint8_t * p_service_data
Service data point

uint16_t service_uuid_len
Service uuid length

uint8_t * p_service_uuid
Service uuid array point

uint8_t flag
Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

struct esp_ble_scan_params_t
Ble scan parameters.

Public Members

esp_ble_scan_type_t scan_type
Scan type

esp_ble_addr_type_t own_addr_type
Owner address type

esp_ble_scan_filter_t scan_filter_policy
Scan filter policy
uint16_t scan_interval
Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16_t scan_window
Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10240 msec

esp_ble_scan_duplicate_t scan_duplicate
The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct esp_gap_conn_params_t
collection parameters information

Public Members

The security level of the security link

uint8_t key_size
The key size(7~16) of the security link

struct esp_ble_pcsrk_keys_t
BLE CSRK keys.

Public Members

uint32_t counter
The counter

esp_bt_octet16_t csrk
The csrk key

uint8_t sec_level
The security level

struct esp_ble_pid_keys_t
BLE pid keys.

Public Members

esp_bt_octet16_t irk
The irk value

esp_ble_addr_type_t addr_type
The address type

esp_bd_addr_t static_addr
The static address

struct esp_ble_lenc_keys_t
BLE Encryption reproduction keys.
Public Members

*esp_bt_octet16_t* `ltk`
   The long term key

*uint16_t* `div`
   The div value

*uint8_t* `key_size`
   The key size of the security link

*uint8_t* `sec_level`
   The security level of the security link

`struct esp_ble_lcsrk_keys`
BLE SRK keys.

Public Members

*uint32_t* `counter`
   The counter value

*uint16_t* `div`
   The div value

*uint8_t* `sec_level`
   The security level of the security link

*esp_bt_octet16_t* `csrk`
   The csrk key value

`struct esp_ble_sec_key_notif_t`
Structure associated with ESP_KEY_NOTIF_EVT.

Public Members

`esp_bd_addr_t` `bd_addr`
   peer address

*uint32_t* `passkey`
   the numeric value for comparison. If just_works, do not show this number to UI

`struct esp_ble_sec_req_t`
   Structure of the security request.

Public Members

`esp_bd_addr_t` `bd_addr`
   peer address

`struct esp_ble_bond_key_info_t`
   struct type of the bond key information value
Public Members

*esp_ble_key_mask_t* `key_mask`
the key mask to indicate which key is present

*esp_ble_penc_keys_t* `penc_key`
received peer encryption key

*esp_ble_pcsrk_keys_t* `pcsrk_key`
received peer device SRK

*esp_ble_pid_keys_t* `pid_key`
peer device ID key

*struct esp_ble_bond_dev_t*
struct type of the bond device value

Public Members

*esp_bd_addr_t* `bd_addr`
peer address

*esp_ble_bond_key_info_t* `bond_key`
the bond key information

*struct esp_ble_key_t*
union type of the security key value

Public Members

*esp_bd_addr_t* `bd_addr`
peer address

*esp_ble_key_type_t* `key_type`
key type of the security link

*esp_ble_key_value_t* `p_key_value`
the pointer to the key value

*struct esp_ble_local_id_keys_t*
structure type of the ble local id keys value

Public Members

*esp_bt_octet16_t* `ir`
the 16 bits of the ir value

*esp_bt_octet16_t* `irk`
the 16 bits of the ir key value

*esp_bt_octet16_t* `dhk`
the 16 bits of the dh key value

*struct esp_ble_auth_cmpl_t*
Structure associated with ESP_AUTH_CMPL_EVT.
Public Members

```c
esp_bd_addr_t bd_addr
BD address peer device.
```

```c
bool key_present
Valid link key value in key element
```

```c
esp_link_key key
Link key associated with peer device.
```

```c
uint8_t key_type
The type of Link Key
```

```c
bool success
TRUE of authentication succeeded, FALSE if failed.
```

```c
uint8_t fail_reason
The HCI reason/error code for when success=FALSE
```

```c
esp_ble_addr_type_t addr_type
Peer device address type
```

```c
esp_bt_dev_type_t dev_type
Device type
```

```c
esp_ble_auth_req_t auth_mode
authentication mode
```

Macros

```c
ESP_BLE_ADV_FLAG_LIMIT_DISC
BLE_ADV_DATA_FLAG data flag bit definition used for advertising data flag
```

```c
ESP_BLE_ADV_FLAG_GEN_DISC
```

```c
ESP_BLE_ADV_FLAG_BREDR_NOT_SPT
```

ESP_GAP_BLE_ADD_WHITELIST_COMPLETE_EVT
This is the old name, just for backwards compatibility.
ESP_BLE_ADV_DATA_LEN_MAX
Advertising data maximum length.
ESP_BLE_SCAN_RSP_DATA_LEN_MAX
Scan response data maximum length.
BLE_BIT (n)

Type Definitions

typedef uint8_t esp_ble_key_type_t
typedef uint8_t esp_ble_auth_req_t
  combination of the above bit pattern
typedef uint8_t esp_ble_io_cap_t
  combination of the io capability
typedef uint8_t esp_gap_ble_channels[ESP_GAP_BLE_CHANNELS_LEN]
typedef uint8_t esp_duplicate_info_t[ESP_BD_ADDR_LEN]
typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_ble_gap_cb_param_t *param)
  GAP callback function type.

Parameters
  • event:: Event type
  • param:: Point to callback parameter, currently is union type

Enumerations

c enum esp_gap_ble_cb_event_t
  GAP BLE callback event type.
  Values:
    ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT = 0
    When advertising data set complete, the event comes
    ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT
    When scan response data set complete, the event comes
    ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT
    When scan parameters set complete, the event comes
    ESP_GAP_BLE_SCAN_RESULT_EVT
    When one scan result ready, the event comes each time
    ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT
    When raw advertising data set complete, the event comes
ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT
When raw advertising data set complete, the event comes

ESP_GAP_BLE_ADV_START_COMPLETE_EVT
When starting advertising complete, the event comes

ESP_GAP_BLE_SCAN_START_COMPLETE_EVT
When starting scan complete, the event comes

ESP_GAP_BLE_AUTH_CMPL_EVT
Authentication complete indication.

ESP_GAP_BLE_KEY_EVT
BLE key event for peer device keys

ESP_GAP_BLE_SEC_REQ_EVT
BLE security request

ESP_GAP_BLE_PASSKEY_NOTIF_EVT
Passkey notification event

ESP_GAP_BLE_PASSKEY_REQ_EVT
Passkey request event

ESP_GAP_BLE_OOB_REQ_EVT
OOB request event

ESP_GAP_BLE_LOCAL_IR_EVT
BLE local IR event

ESP_GAP_BLE_LOCAL_ER_EVT
BLE local ER event

ESP_GAP_BLE_NC_REQ_EVT
Numeric Comparison request event

ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT
When stopping adv complete, the event comes

ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT
When stopping scan complete, the event comes

ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT
When setting the static rand address complete, the event comes

ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT
When updating connection parameters complete, the event comes

ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT
When setting pkt length complete, the event comes

ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT
When enabling/disabling privacy on the local device complete, the event comes

ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT
When removing the bond device complete, the event comes

ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT
When clearing the bond device clear complete, the event comes

ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT
When getting the bond device list complete, the event comes
ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT
When reading the rssi complete, the event comes

ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT
When adding or removing whitelist complete, the event comes

ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT
When updating duplicate exceptional list complete, the event comes

ESP_GAP_BLE_SET_CHANNELS_EVT
When setting BLE channels complete, the event comes

ESP_GAP_BLE_EVT_MAX

enum esp_ble_adv_data_type
The type of advertising data(not adv_type)

Values:

enum esp_ble_scan_type_t

Ble scan type.

Values:

BLE_SCAN_TYPE_PASSIVE = 0x0
  Passive scan
BLE_SCAN_TYPE_ACTIVE = 0x1
  Active scan

enum esp_ble_scan_filter_t

Ble scan filter type.

Values:

BLE_SCAN_FILTER_ALLOW_ALL = 0x0
  Accept all:
  1. advertisement packets except directed advertising packets not addressed to this device (default).

BLE_SCAN_FILTER_ALLOW_ONLY_WLST = 0x1
  Accept only:
  1. advertisement packets from devices where the advertiser’s address is in the White list.
  2. Directed advertising packets which are not addressed for this device shall be ignored.

BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR = 0x2
  Accept all:
  1. undirected advertisement packets, and
  2. directed advertising packets where the initiator address is a resolvable private address, and
  3. directed advertising packets addressed to this device.

BLE_SCAN_FILTER_ALLOW_WLIST_PRA_DIR = 0x3
  Accept all:
1. advertisement packets from devices where the advertiser’s address is in the White list, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

```c
enum esp_ble_scan_duplicate_t
Ble scan duplicate type.

Values:

BLE_SCAN_DUPLICATE_DISABLE = 0x0
the Link Layer should generate advertising reports to the host for each packet received

BLE_SCAN_DUPLICATE_ENABLE = 0x1
the Link Layer should filter out duplicate advertising reports to the Host

BLE_SCAN_DUPLICATE_MAX = 0x2
0x02 – 0xFF, Reserved for future use
```

```c
enum esp_gap_search_evt_t
Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.

Values:

ESP_GAP_SEARCH_INQ_RES_EVT = 0
Inquiry result for a peer device.

ESP_GAP_SEARCH_INQ_CMPL_EVT = 1
Inquiry complete.

ESP_GAP_SEARCH_DISC_RES_EVT = 2
Discovery result for a peer device.

ESP_GAP_SEARCH_DISC_BLE_RES_EVT = 3
Discovery result for BLE GATT based service on a peer device.

ESP_GAP_SEARCH_DISC_CMPL_EVT = 4
Discovery complete.

ESP_GAP_SEARCH_DISC_BLE_CMPL_EVT = 5
Discovery complete.

ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT = 6
Search cancelled

ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT = 7
The number of pkt discarded by flow control
```

```c
enum esp_ble_evt_type_t
Ble scan result event type, to indicate the result is scan response or advertising data or other.

Values:

ESP_BLE_EVT_CONN_ADV = 0x00
Connectable undirected advertising (ADV_IND)

ESP_BLE_EVT_CONN_DIR_ADV = 0x01
Connectable directed advertising (ADV_DIRECT_IND)

ESP_BLE_EVT_DISC_ADV = 0x02
Scannable undirected advertising (ADV_SCAN_IND)

ESP_BLE_EVT_NON_CONN_ADV = 0x03
Non connectable undirected advertising (ADV_NONCONN_IND)
```

2.1. Bluetooth API
ESP_BLE_EVT_SCAN_RSP = 0x04
Scan Response (SCAN_RSP)

enum esp_ble_wl_opration_t
Values:

ESP_BLE_WHITELIST_REMOVE = 0X00
remove mac from whitelist

ESP_BLE_WHITELIST_ADD = 0X01
add address to whitelist

enum esp_bt_duplicate_exceptional_subcode_type_t
Values:

ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD = 0
Add device info into duplicate scan exceptional list

ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE
Remove device info from duplicate scan exceptional list

ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN
Clean duplicate scan exceptional list

enum esp_ble_duplicate_exceptional_info_type_t
Values:

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR = 0
BLE advertising address, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID
BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE
BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV
BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ... |

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV
BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ... |

enum esp_duplicate_scan_exceptional_list_type_t
Values:

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST = BLE_BIT(0)
duplicate scan exceptional addr list

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST = BLE_BIT(1)
duplicate scan exceptional mesh link ID list

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST = BLE_BIT(2)
duplicate scan exceptional mesh beacon type list

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST = BLE_BIT(3)
duplicate scan exceptional mesh adv with provisioning service uuid

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST = BLE_BIT(4)
duplicate scan exceptional mesh adv with provisioning service uuid

ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST = 0xFFFF
duplicate scan exceptional all list

Instructions

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_gatt_defs.h

Unions

union esp_gatt_rsp_t
#include <esp_gatt_defs.h> GATT remote read request response type.

Public Members

esp_gatt_value_t attr_value
   Gatt attribute structure

uint16_t handle
   Gatt attribute handle

Structures

struct esp_gatt_id_t
   Gatt id, include uuid and instance id.

Public Members

esp_bt_uuid_t uuid
   UUID

uint8_t inst_id
   Instance id

struct esp_gatt_srvc_id_t
   Gatt service id, include id (uuid and instance id) and primary flag.
**Public Members**

```c
esp_gatt_id_t id
    Gatt id, include uuid and instance

bool is_primary
    This service is primary or not
```

**struct esp_attr_desc_t**

Attribute description (used to create database)

**Public Members**

```c
uint16_t uuid_length
    UUID length

uint8_t *uuid_p
    UUID value

uint16_t perm
    Attribute permission

uint16_t max_length
    Maximum length of the element

uint16_t length
    Current length of the element

uint8_t *value
    Element value array
```

**struct esp_attr_control_t**

attribute auto response flag

**Public Members**

```c
uint8_t auto_rsp
    if auto_rsp set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will be replied by application. if auto_rsp set to ESP_GATT_AUTO_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.
```

**struct esp_gatts_attr_db_t**

attribute type added to the gatt server database

**Public Members**

```c
esp_attr_control_t attr_control
    The attribute control type

esp_attr_desc_t attr_desc
    The attribute type

struct esp_attr_value_t
    set the attribute value type
```
Public Members

- uint16_t **attr_max_len**
  
  attribute max value length

- uint16_t **attr_len**
  
  attribute current value length

- uint8_t **attr_value**
  
  the pointer to attribute value

- struct esp_gatts_incl_svc_desc_t
  
  Gatt include service entry element.

Public Members

- uint16_t **start_hdl**
  
  Gatt start handle value of included service

- uint16_t **end_hdl**
  
  Gatt end handle value of included service

- uint16_t **uuid**
  
  Gatt attribute value UUID of included service

- struct esp_gatts_incl128_svc_desc_t
  
  Gatt include 128 bit service entry element.

Public Members

- uint16_t **start_hdl**
  
  Gatt start handle value of included 128 bit service

- uint16_t **end_hdl**
  
  Gatt end handle value of included 128 bit service

- struct esp_gatt_value_t
  
  Gatt attribute value.

Public Members

- uint8_t **value[ESP_GATT_MAX_ATTR_LEN]**
  
  Gatt attribute value

- uint16_t **handle**
  
  Gatt attribute handle

- uint16_t **offset**
  
  Gatt attribute value offset

- uint16_t **len**
  
  Gatt attribute value length

- uint8_t **auth_req**
  
  Gatt authentication request

- struct esp_gatt_conn_params_t
  
  Connection parameters information.
Public Members

uint16_t interval
connection interval

uint16_t latency
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_gattc_multi_t
read multiple attribute

Public Members

uint8_t num_attr
The number of the attribute

uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]
The handles list

struct esp_gattc_db_elem_t
data base attribute element

Public Members

esp_gatt_db_attr_type_t type
The attribute type

uint16_t attribute_handle
The attribute handle, it's valid for all of the type

uint16_t start_handle
The service start handle, it's valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or
ESP_GATT_DB_SECONDARY_SERVICE

uint16_t end_handle
The service end handle, it's valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or
ESP_GATT_DB_SECONDARY_SERVICE

esp_gatt_char_prop_t properties
The characteristic properties, it's valid only when the type = ESP_GATT_DB_CHARACTERISTIC

esp_bt_uuid_t uuid
The attribute uuid, it's valid for all of the type

struct esp_gattc_service_elem_t
service element

Public Members

bool is_primary
The service flag, true if the service is primary service, else is secondary service

uint16_t start_handle
The start handle of the service
```c
uint16_t end_handle
    The end handle of the service

esp_bt.uuid_t uuid
    The uuid of the service

struct esp_gattc_char_elem_t
    characteristic element

Public Members

uint16_t char_handle
    The characteristic handle

esp_gatt_char_prop_t properties
    The characteristic properties

esp_bt.uuid_t uuid
    The characteristic uuid

struct esp_gattc_descr_elem_t
descriptor element

Public Members

uint16_t handle
    The characteristic descriptor handle

esp_bt.uuid_t uuid
    The characteristic descriptor uuid

struct esp_gattc_incl_svc_elem_t
    include service element

Public Members

uint16_t handle
    The include service current attribute handle

uint16_t incl_srvc_s_handle
    The start handle of the service which has been included

uint16_t incl_srvc_e_handle
    The end handle of the service which has been included

esp_bt.uuid_t uuid
    The include service uuid

Macros

ESP_GATT_UUID_IMMEDIATE_ALERT_SVC
    All “ESP_GATT_UUID_xxx” is attribute types

ESP_GATT_UUID_LINK_LOSS_SVC

ESP_GATT_UUID_TX_POWER_SVC

Type Definitions

typedef uint16_t esp_gatt_perm_t

typedef uint8_t esp_gatt_char_prop_t

typedef uint8_t esp_gatt_if_t
    Gatt interface type, different application on GATT client use different gatt_if

Enumerations

enum esp_gatt_prep_write_type
    Attribute write data type from the client.
    Values:

    ESP_GATT_PREP_WRITE_CANCEL = 0x00
        Prepare write cancel
    ESP_GATT_PREP_WRITE_EXEC = 0x01
        Prepare write execute

enum esp_gatt_status_t
    GATT success code and error codes.
    Values:

    ESP_GATT_OK = 0x0
    ESP_GATT_INVALID_HANDLE = 0x01
    ESP_GATT_READ_NOT_PERMIT = 0x02
    ESP_GATT_WRITE_NOT_PERMIT = 0x03
    ESP_GATT_INVALID_PDU = 0x04
    ESP_GATT_INSUF_AUTHENTICATION = 0x05
ESP_GATT_REQ_NOT_SUPPORTED = 0x06
ESP_GATT_INVALID_OFFSET = 0x07
ESP_GATT_INSUF_AUTHORIZATION = 0x08
ESP_GATT_PREPARE_Q_FULL = 0x09
ESP_GATT_NOT_FOUND = 0x0a
ESP_GATT_NOT_LONG = 0x0b
ESP_GATT_INSUF_KEY_SIZE = 0x0c

ESP_GATT_UNKNOWN_ERROR = 0xef
ESP_GATT_CCC_CFG_ERR = 0xfd
ESP_GATT_PRC_IN_PROGRESS = 0xFE
ESP_GATT_OUT_OF_RANGE = 0xFF

enum esp_gatt_conn_reason_t
Gatt Connection reason enum.
Values:

ESP_GATT_CONN_UNKNOWN = 0
Gatt connection unknown
ESP_GATT_CONN_L2C_FAILURE = 1
General L2cap failure
ESP_GATT_CONN_TIMEOUT = 0x08
Connection timeout
ESP_GATT_CONN_TERMINATE_PEER_USER = 0x13
Connection terminate by peer user
ESP_GATT_CONN_TERMINATE_LOCAL_HOST = 0x16
Connection terminated by local host
ESP_GATT_CONN_FAIL_ESTABLISH = 0x3E
Connection fail to establish
ESP_GATT_CONN_LMP_TIMEOUT = 0x22
Connection fail for LMP response tout
ESP_GATT_CONN_CONN_CANCEL = 0x0100
L2CAP connection cancelled
ESP_GATT_CONN_NONE = 0x0101
No connection to cancel

enum esp_gatt_auth_req_t
Gatt authentication request type.
Values:

ESP_GATT_AUTH_REQ_NONE = 0
ESP_GATT_AUTH_REQ_NO_MITM = 1
ESP_GATT_AUTH_REQ_MITM = 2
ESP_GATT_AUTH_REQ_SIGNED_NO_MITM = 3
ESP_GATT_AUTH_REQ_SIGNED_MITM = 4

enum esp_service_source_t
Values:

ESP_GATT_SERVICE_FROM_REMOTE_DEVICE = 0
ESP_GATT_SERVICE_FROM_NVSD_FLASH = 1
ESP_GATT_SERVICE_FROM_UNKNOWN = 2

enum esp_gatt_write_type_t
Gatt write type.
Values:

ESP_GATT_WRITE_TYPE_NO_RSP = 1
Gatt write attribute need no response
ESP_GATT_WRITE_TYPE_RSP
Gatt write attribute need remote response

def _esp_gatt_db_attr_type_t
the type of attribute element

Values:

ESP_GATT_DB_PRIMARY_SERVICE
Gattc primary service attribute type in the cache

ESP_GATT_DB_SECONDARY_SERVICE
Gattc secondary service attribute type in the cache

ESP_GATT_DB_CHARACTERISTIC
Gattc characteristic attribute type in the cache

ESP_GATT_DB_DESCRIPTOR
Gattc characteristic descriptor attribute type in the cache

ESP_GATT_DB_INCLUDED_SERVICE
Gattc include service attribute type in the cache

ESP_GATT_DB_ALL
Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type
in the cache

GATT SERVER API

Overview

Instructions

Application Example

Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

• This is a GATT server demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  – bluetooth/bluedroid/ble/gatt_server_service_table
  – GATT Server Service Table Example Walkthrough

• This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  – bluetooth/bluedroid/ble/gatt_server
  – GATT Server Example Walkthrough

• This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  – bluetooth/bluedroid/ble/ble_spp_server
API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_gatts_api.h

Functions

```c
esp_err_t esp_ble_gatts_register_callback (esp_gatts_cb_t callback)
```

This function is called to register application callbacks with BTA GATTs module.

**Return**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gatts_app_register (uint16_t app_id)
```

This function is called to register application identifier.

**Return**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gatts_app_unregister (esp_gatt_if_t gatts_if)
```

unregister with GATT Server.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- gatts_if: GATT server access interface

```c
esp_err_t esp_ble_gatts_create_service (esp_gatt_if_t gatts_if, esp_gatt_srvc_id_t *service_id, uint16_t num_handle)
```

Create a service. When service creation is done, a callback event BTA_GATTS_CREATE_SRVC_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- gatts_if: GATT server access interface
- service_id: service ID.
- num_handle: number of handle requested for this service.
esp_err_t esp_ble_gatts_create_attr_tab(const esp_gatts_attr_db_t *gatts_attr_db, esp_gatt_if_t gatts_if, uint8_t max_nb_attr, uint8_t srvc_inst_id)

Create a service attribute tab.

Return

- ESP_OK : success
- other : failed

Parameters

- gatts_attr_db: the pointer to the service attr tab
- gatts_if: GATT server access interface
- max_nb_attr: the number of attribute to be added to the service database.
- srvc_inst_id: the instance id of the service

esp_err_t esp_ble_gatts_add_included_service(uint16_t service_handle, uint16_t included_service_handle)

This function is called to add an included service. This function have to be called between 'esp_ble_gatts_create_service' and 'esp_ble_gatts_add_char'. After included service is included, a callback event BTA_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

Return

- ESP_OK : success
- other : failed

Parameters

- service_handle: service handle to which this included service is to be added.
- included_service_handle: the service ID to be included.

esp_err_t esp_ble_gatts_add_char(uint16_t service_handle, esp_bt_uuid_t *char_uuid, esp_gatt_perm_t perm, esp_gatt_char_prop_t property, esp_attr_value_t *char_val, esp_attr_control_t *control)

This function is called to add a characteristic into a service.

Return

- ESP_OK : success
- other : failed

Parameters

- service_handle: service handle to which this included service is to be added.
- char_uuid: Characteristic UUID.
- perm: Characteristic value declaration attribute permission.
- property: Characteristic Properties
- char_val: Characteristic value
- control: attribute response control byte
Esp_err_t esp_ble_gatts_add_char_descr(uint16_t service_handle, esp_bt_uuid_t *descr_uuid, esp_gatt_perm_t perm, esp_attr_value_t *char_descr_val, esp_attr_control_t *control)

This function is called to add characteristic descriptor. When it's done, a callback event BTA_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

Return
• ESP_OK : success
• other : failed

Parameters
• service_handle: service handle to which this characteristic descriptor is to be added.
• perm: descriptor access permission.
• descr_uuid: descriptor UUID.
• char_descr_val: Characteristic descriptor value
• control: attribute response control byte

Esp_err_t esp_ble_gatts_delete_service(uint16_t service_handle)

This function is called to delete a service. When this is done, a callback event BTA_GATTS_DELETE_EVT is report with the status.

Return
• ESP_OK : success
• other : failed

Parameters
• service_handle: service_handle to be deleted.

Esp_err_t esp_ble_gatts_start_service(uint16_t service_handle)

This function is called to start a service.

Return
• ESP_OK : success
• other : failed

Parameters
• service_handle: the service handle to be started.

Esp_err_t esp_ble_gatts_stop_service(uint16_t service_handle)

This function is called to stop a service.

Return
• ESP_OK : success
• other : failed

Parameters
• service_handle: - service to be topped.

2.1. Bluetooth API
`esp_err_t esp_ble_gatts_send_indicate(esp_gatt_if_t gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t *value, bool need_confirm)`

Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- `gatts_if`: GATT server access interface
- `conn_id`: connection id to indicate.
- `attr_handle`: attribute handle to indicate.
- `value_len`: indicate value length.
- `value`: value to indicate.
- `need_confirm`: Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

`esp_err_t esp_ble_gatts_send_response(esp_gatt_if_t gatts_if, uint16_t conn_id, uint32_t trans_id, esp_gatt_status_t status, esp_gatt_rsp_t *rsp)`

This function is called to send a response to a request.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- `gatts_if`: GATT server access interface
- `conn_id`: connection identifier.
- `trans_id`: transfer id
- `status`: response status
- `rsp`: response data.

`esp_err_t esp_ble_gatts_set_attr_value(uint16_t attr_handle, uint16_t length, const uint8_t *value)`

This function is called to set the attribute value by the application.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- `attr_handle`: the attribute handle which to be set
- `length`: the value length
- `value`: the pointer to the attribute value
```c
esp_gatt_status_t esp_ble_gatts_get_attr_value(uint16_t attr_handle, uint16_t *length, const uint8_t **value)
```

Retrieve attribute value.

**Return**
- ESP_GATT_OK : success
- other : failed

**Parameters**
- attr_handle: Attribute handle.
- length: pointer to the attribute value length
- value: Pointer to attribute value payload, the value cannot be modified by user

```c
esp_err_t esp_ble_gatts_open(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda, bool is_direct)
```

Open a direct open connection or add a background auto connection.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- gatts_if: GATT server access interface
- remote_bda: remote device bluetooth device address.
- is_direct: direct connection or background auto connection

```c
esp_err_t esp_ble_gatts_close(esp_gatt_if_t gatts_if, uint16_t conn_id)
```

Close a connection a remote device.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- gatts_if: GATT server access interface
- conn_id: connection ID to be closed.

```c
esp_err_t esp_ble_gatts_send_service_change_indication(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda)
```

Send service change indication.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- gatts_if: GATT server access interface
• remote_bda: remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

Unions

union esp_ble_gatts_cb_param_t
    #include <esp_gatts_api.h> Gatt server callback parameters union.

Public Members

Connection id
```

```c
uint32_t trans_id
Transfer id
```

```c
esp_bd_addr_t bda
The bluetooth device address which been written
```
**uint16_t handle**
The attribute handle

**uint16_t offset**
Offset of the value, if the value is too long

**bool need_rsp**
The write operation need to do response

**bool is_prep**
This write operation is prepare write

**uint16_t len**
The write attribute value length

**uint8_t *value**
The write attribute value

---

**Macros**

**ESP_GATT_PREP_WRITE_CANCEL**
Prepare write flag to indicate cancel prepare write

**ESP_GATT_PREP_WRITE_EXEC**
Prepare write flag to indicate execute prepare write

---

**Type Definitions**

**typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if,**

**esp_ble_gatts_cb_param_t *param)**

GATT Server callback function type.

**Parameters**

- **event::** Event type
- **gatts_if::** GATT server access interface, normally different gatts_if correspond to different profile
- **param::** Point to callback parameter, currently is union type

---

**Enumerations**

**enum esp_gatts_cb_event_t**
GATT Server callback function events.

**Values:**

**ESP_GATTS_REG_EVT = 0**
When register application id, the event comes

**ESP_GATTS_READ_EVT = 1**
When gatt client request read operation, the event comes

**ESP_GATTS_WRITE_EVT = 2**
When gatt client request write operation, the event comes

**ESP_GATTS_EXEC_WRITE_EVT = 3**
When gatt client request execute write, the event comes

---

2.1. Bluetooth API
ESP_GATTS_MTU_EVT = 4
    When set mtu complete, the event comes
ESP_GATTS_CONF_EVT = 5
    When receive confirm, the event comes
ESP_GATTS_UNREG_EVT = 6
    When unregister application id, the event comes
ESP_GATTS_CREATE_EVT = 7
    When create service complete, the event comes
ESP_GATTS_ADD_INCL_SRVCP_EVT = 8
    When add included service complete, the event comes
ESP_GATTS_ADD_CHAR_EVT = 9
    When add characteristic complete, the event comes
ESP_GATTS_ADD_CHAR_DESCR_EVT = 10
    When add descriptor complete, the event comes
ESP_GATTS_DELETE_EVT = 11
    When delete service complete, the event comes
ESP_GATTS_START_EVT = 12
    When start service complete, the event comes
ESP_GATTS_STOP_EVT = 13
    When stop service complete, the event comes
ESP_GATTS_CONNECT_EVT = 14
    When gatt client connect, the event comes
ESP_GATTS_DISCONNECT_EVT = 15
    When gatt client disconnect, the event comes
ESP_GATTS_OPEN_EVT = 16
    When connect to peer, the event comes
ESP_GATTS_CANCEL_OPEN_EVT = 17
    When disconnect from peer, the event comes
ESP_GATTS_CLOSE_EVT = 18
    When gatt server close, the event comes
ESP_GATTS_LISTEN_EVT = 19
    When gatt listen to be connected the event comes
ESP_GATTS_CONGEST_EVT = 20
    When congest happen, the event comes
ESP_GATTS_RESPONSE_EVT = 21
    When gatt send response complete, the event comes
ESP_GATTS_CREAT_ATTR_TAB_EVT = 22
    When gatt create table complete, the event comes
ESP_GATTS_SET_ATTR_VAL_EVT = 23
    When gatt set attr value complete, the event comes
ESP_GATTS_SEND_SERVICE_CHANGE_EVT = 24
    When gatt send service change indication complete, the event comes
GATT CLIENT API

Overview

Instructions

Application Example

Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - bluetooth/bluedroid/ble/gatt_client
  - GATT Client Example Walkthrough

- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - bluetooth/bluedroid/ble/gatc_multi_connect
  - GATT Client Multi-connection Example Walkthrough

- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_client

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_gattc_api.h

Functions

```c
esp_err_t esp_ble_gattc_register_callback (esp_gattc_cb_t callback)
```

This function is called to register application callbacks with GATTC module.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- callback: pointer to the application callback function.

```c
esp_err_t esp_ble_gattc_app_register (uint16_t app_id)
```

This function is called to register application callbacks with GATTC module.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- app_id: Application Identify (UUID), for different application

```c
esp_err_t esp_ble_gattc_app_unregister(esp_gatt_if_t gattc_if)
```

This function is called to unregister an application from GATT module.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- gattc_if: Gatt client access interface.

```c
esp_err_t esp_ble_gattc_open(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)
```

Open a direct connection or add a background auto connection.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- gattc_if: Gatt client access interface.
- remote_bda: remote device bluetooth device address.
- remote_addr_type: remote device bluetooth device the address type.
- is_direct: direct connection or background auto connection

```c
esp_err_t esp_ble_gattc_close(esp_gatt_if_t gattc_if, uint16_t conn_id)
```

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- gattc_if: Gatt client access interface.
- conn_id: connection ID to be closed.

```c
esp_err_t esp_ble_gattc_send_mtu_req(esp_gatt_if_t gattc_if, uint16_t conn_id)
```

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

**Return**

- ESP_OK: success
• other: failed

Parameters

• gattc_if: Gatt client access interface.
• conn_id: connection ID.

`esp_err_t esp_ble_gattc_search_service(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *filter_uuid)`

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

Return

• ESP_OK: success
• other: failed

Parameters

• gattc_if: Gatt client access interface.
• conn_id: connection ID.
• filter_uuid: a UUID of the service application is interested in. If Null, discover for all services.

`esp_gatt_status_t esp_ble_gattc_get_service(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *svc_uuid, esp_gattc_service_elem_t *result, uint16_t *count, uint16_t offset)`

Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service.

Note: It just get service from local cache, won’t get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_search_service.

Return

• ESP_OK: success
• other: failed

Parameters

• gattc_if: Gatt client access interface.
• conn_id: connection ID which identify the server.
• svc_uuid: the pointer to the service uuid.
• result: The pointer to the service which has been found in the gattc cache.
• count: input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
• offset: Offset of the service position to get.

`esp_gatt_status_t esp_ble_gattc_get_all_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gatt_char_elem_t *result, uint16_t *count, uint16_t offset)`

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

Return
ESP_OK: success
other: failed

Parameters
- gattc_if: Gatt client access interface.
- conn_id: connection ID which identify the server.
- start_handle: the attribute start handle.
- end_handle: the attribute end handle
- result: The pointer to the characteristic in the service.
- count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- offset: Offset of the characteristic position to get.

```
esp_gatt_status_t esp_ble_gattc_get_all_descr (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_gattc_descr_elem_t *result, uint16_t *count, uint16_t offset)
```

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
- ESP_OK: success
other: failed

Parameters
- gattc_if: Gatt client access interface.
- conn_id: connection ID which identify the server.
- char_handle: the given characteristic handle
- result: The pointer to the descriptor in the characteristic.
- count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- offset: Offset of the descriptor position to get.

```
esp_gatt_status_t esp_ble_gattc_get_char_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_gattc_char_elem_t *result, uint16_t *count)
```

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.
• conn_id: connection ID which identify the server.
• start_handle: the attribute start handle
• end_handle: the attribute end handle
• char_uuid: the characteristic uuid
• result: The pointer to the characteristic in the service.
• count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id,
    uint16_t start_handle, uint16_t end_handle,
    esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid,
    esp_gattc_descr_elem_t *result,
    uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• gattc_if: Gatt client access interface.
• conn_id: connection ID which identify the server.
• start_handle: the attribute start handle
• end_handle: the attribute end handle
• char_uuid: the characteristic uuid.
• descr_uuid: the descriptor uuid.
• result: The pointer to the descriptor in the given characteristic.
• count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle (esp_gatt_if_t gattc_if, uint16_t conn_id,
    uint16_t char_handle,
    esp_bt_uuid_t descr_uuid,
    esp_gattc_descr_elem_t *result,
    uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• gattc_if: Gatt client access interface.
• conn_id: connection ID which identify the server.
• **char_handle**: the characteristic handle.
• **descr_uuid**: the descriptor uuid.
• **result**: The pointer to the descriptor in the given characteristic.
• **count**: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_include_service(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                                uint16_t start_handle, uint16_t end_handle,
                                                esp_bt_uuid_t *incl_uuid,
                                                esp_gattc_incl_svc_elem_t *result,
                                                uint16_t *count)
```

Find the include service with the given service handle in the gattc cache. Note: It just get include service from local cache, won’t get from remote devices.

**Return**

• **ESP_OK**: success
• **other**: failed

**Parameters**

• **gattc_if**: Gatt client access interface.
• **conn_id**: connection ID which identify the server.
• **start_handle**: the attribute start handle
• **end_handle**: the attribute end handle
• **incl_uuid**: the include service uuid
• **result**: The pointer to the include service in the given service.
• **count**: input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

```c
esp_gatt_status_t esp_ble_gattc_get_attr_count(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                              esp_gatt_db_attr_type_t type, uint16_t start_handle, uint16_t end_handle,
                                              char_handle, uint16_t *count)
```

Find the attribute count with the given service or characteristic in the gattc cache.

**Return**

• **ESP_OK**: success
• **other**: failed

**Parameters**

• **gattc_if**: Gatt client access interface.
• **conn_id**: connection ID which identify the server.
• **type**: the attribute type.
• **start_handle**: the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
• **end_handle**: the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
• **char_handle**: the characteristic handle, this parameter valid when the type is `ESP_GATT_DB_DESCRIPTOR`. If the type isn’t `ESP_GATT_DB_DESCRIPTOR`, this parameter should be ignored.

• **count**: output the number of attribute has been found in the gattc cache with the given attribute type.

```c
esp_gatt_status_t esp_ble_gattc_get_db(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_db_elem_t *db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won’t get from remote devices.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- **gattc_if**: Gatt client access interface.
- **start_handle**: the attribute start handle
- **end_handle**: the attribute end handle
- **conn_id**: connection ID which identify the server.
- **db**: output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- **count**: number of elements in database.

```c
esp_err_t esp_ble_gattc_read_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic handle.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- **gattc_if**: Gatt client access interface.
- **conn_id**: connection ID.
- **handle**: characteristic handle to read.
- **auth_req**: authenticate request type

```c
esp_err_t esp_ble_gattc_read_multiple(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)
```

This function is called to read multiple characteristic or characteristic descriptors.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- **gattc_if**: Gatt client access interface.
• conn_id: connection ID.
• read_multi: pointer to the read multiple parameter.
• auth_req: authenticate request type

```
esp_err_t esp_ble_gattc_read_char_descr (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a characteristics descriptor.

Return

• ESP_OK: success
• other: failed

Parameters

• gattc_if: Gatt client access interface.
• conn_id: connection ID.
• handle: descriptor handle to read.
• auth_req: authenticate request type

```
esp_err_t esp_ble_gattc_write_char (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic value.

Return

• ESP_OK: success
• other: failed

Parameters

• gattc_if: Gatt client access interface.
• conn_id: connection ID.
• handle: characteristic handle to write.
• value_len: length of the value to be written.
• value: the value to be written.
• write_type: the type of attribute write operation.
• auth_req: authentication request.

```
esp_err_t esp_ble_gattc_write_char_descr (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic descriptor value.

Return

• ESP_OK: success
• other: failed
Parameters

- `gattc_if`: Gatt client access interface.
- `conn_id`: connection ID.
- `handle`: descriptor handle to write.
- `value_len`: length of the value to be written.
- `value`: the value to be written.
- `write_type`: the type of attribute write operation.
- `auth_req`: authentication request.

```c
esp_err_t esp_ble_gattc_prepare_write(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic value.

Return

- ESP_OK: success
- other: failed

Parameters

- `gattc_if`: Gatt client access interface.
- `conn_id`: connection ID.
- `handle`: characteristic handle to prepare write.
- `offset`: offset of the write value.
- `value_len`: length of the value to be written.
- `value`: the value to be written.
- `auth_req`: authentication request.

```c
esp_err_t esp_ble_gattc_prepare_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic descriptor value.

Return

- ESP_OK: success
- other: failed

Parameters

- `gattc_if`: Gatt client access interface.
- `conn_id`: connection ID.
- `handle`: characteristic descriptor handle to prepare write.
- `offset`: offset of the write value.
- `value_len`: length of the value to be written.
• value: the value to be written.
• auth_req: authentication request.

```c
esp_err_t esp_ble_gattc_execute_write(esp_gatt_if_t gattc_if, uint16_t conn_id, bool is_execute)
```

This function is called to execute write a prepare write sequence.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- gattc_if: Gatt client access interface.
- conn_id: connection ID.
- is_execute: execute or cancel.

```c
esp_err_t esp_ble_gattc_register_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```

This function is called to register for notification of a service.

**Return**

- ESP_OK: registration succeeds
- other: failed

**Parameters**

- gattc_if: Gatt client access interface.
- server_bda: target GATT server.
- handle: GATT characteristic handle.

```c
esp_err_t esp_ble_gattc_unregister_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```

This function is called to de-register for notification of a service.

**Return**

- ESP_OK: unregister succeeds
- other: failed

**Parameters**

- gattc_if: Gatt client access interface.
- server_bda: target GATT server.
- handle: GATT characteristic handle.

```c
esp_err_t esp_ble_gattc_cache_refresh(esp_bd_addr_t remote_bda)
```

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

**Return**

- ESP_OK: success
• other: failed

**Parameters**

• `remote_bda`: remote device BD address.

```c
esp_err_t esp_ble_gattc_cache_assoc(esp_gatt_if_t gattc_if, esp_bd_addr_t src_addr,
                                    esp_bd_addr_t assoc_addr, bool is_assoc)
```

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device’s attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mains that device want to used the database has stored in the local cache. The source address mains that device want to share the database to the associated address device.

**Return**

• ESP_OK: success
• other: failed

**Parameters**

• `gattc_if`: Gatt client access interface.
• `src_addr`: the source address which provide the attribute table.
• `assoc_addr`: the associated device address which went to share the attribute table with the source address.
• `is_assoc`: true add the associated device address, false remove the associated device address.

```c
esp_err_t esp_ble_gattc_cache_get_addr_list(esp_gatt_if_t gattc_if)
```

Get the address list which has store the attribute table in the gattc cache. There will callback ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

**Return**

• ESP_OK: success
• other: failed

**Parameters**

• `gattc_if`: Gatt client access interface.

```c
esp_err_t esp_ble_gattc_cache_clean(esp_bd_addr_t remote_bda)
```

Clean the service cache of this device in the gattc stack.

**Return**

• ESP_OK: success
• other: failed

**Parameters**

• `remote_bda`: remote device BD address.
Unions

### Type Definitions

typedef void (*esp_gattc_cb_t) (esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if, esp_ble_gattc_cb_param_t *param)

GATT Client callback function type.

**Parameters**

- **event::** Event type
- **gatts_if::** GATT client access interface, normally different gattc_if correspond to different profile
- **param::** Point to callback parameter, currently is union type

### Enumerations

```c
enum esp_gattc_cb_event_t
GATT Client callback function events.

Values:

ESP_GATTC_REG_EVT = 0
  When GATT client is registered, the event comes

ESP_GATTC_UNREG_EVT = 1
  When GATT client is unregistered, the event comes

ESP_GATTC_OPEN_EVT = 2
  When GATT virtual connection is set up, the event comes

ESP_GATTC_READ_CHAR_EVT = 3
  When GATT characteristic is read, the event comes

ESP_GATTC_WRITE_CHAR_EVT = 4
  When GATT characteristic write operation completes, the event comes

ESP_GATTC_CLOSE_EVT = 5
  When GATT virtual connection is closed, the event comes

ESP_GATTC_SEARCH_CMPL_EVT = 6
  When GATT service discovery is completed, the event comes

ESP_GATTC_SEARCH_RES_EVT = 7
  When GATT service discovery result is got, the event comes

ESP_GATTC_READ_DESCR_EVT = 8
  When GATT characteristic descriptor read completes, the event comes

ESP_GATTC_WRITE_DESCR_EVT = 9
  When GATT characteristic descriptor write completes, the event comes

ESP_GATTC_NOTIFY_EVT = 10
  When GATT notification or indication arrives, the event comes
```
ESP_GATTC_PREP_WRITE_EVT = 11
   When GATT prepare-write operation completes, the event comes

ESP_GATTC_EXEC_EVT = 12
   When write execution completes, the event comes

ESP_GATTC_ACL_EVT = 13
   When ACL connection is up, the event comes

ESP_GATTC_CANCEL_OPEN_EVT = 14
   When GATT client ongoing connection is cancelled, the event comes

ESP_GATTC_SRVC_CHG_EVT = 15
   When “service changed” occurs, the event comes

ESP_GATTC_ENC_CMPL_CB_EVT = 17
   When encryption procedure completes, the event comes

ESP_GATTC_CFG_MTU_EVT = 18
   When configuration of MTU completes, the event comes

ESP_GATTC_ADV_DATA_EVT = 19
   When advertising of data, the event comes

ESP_GATTC_MULT_ADV_ENB_EVT = 20
   When multi-advertising is enabled, the event comes

ESP_GATTC_MULT_ADV_UPD_EVT = 21
   When multi-advertising parameters are updated, the event comes

ESP_GATTC_MULT_ADV_DATA_EVT = 22
   When multi-advertising data arrives, the event comes

ESP_GATTC_MULT_ADV_DIS_EVT = 23
   When multi-advertising is disabled, the event comes

ESP_GATTC_CONGEST_EVT = 24
   When GATT connection congestion comes, the event comes

ESP_GATTC_BTH_SCAN_ENB_EVT = 25
   When batch scan is enabled, the event comes

ESP_GATTC_BTH_SCAN_CFG_EVT = 26
   When batch scan storage is configured, the event comes

ESP_GATTC_BTH_SCAN_RD_EVT = 27
   When Batch scan read event is reported, the event comes

ESP_GATTC_BTH_SCAN_THR_EVT = 28
   When Batch scan threshold is set, the event comes

ESP_GATTC_BTH_SCAN_PARAM_EVT = 29
   When Batch scan parameters are set, the event comes

ESP_GATTC_BTH_SCAN_DIS_EVT = 30
   When Batch scan is disabled, the event comes

ESP_GATTC_SCAN_FLT_CFG_EVT = 31
   When Scan filter configuration completes, the event comes

ESP_GATTC_SCAN_FLT_PARAM_EVT = 32
   When Scan filter parameters are set, the event comes
ESP_GATTC_SCANFLT_STATUS_EVT = 33
   When scan filter status is reported, the event comes

ESP_GATTC_ADV_VSC_EVT = 34
   When advertising vendor spec content event is reported, the event comes

ESP_GATTC_REGFOR_NOTIFY_EVT = 38
   When register for notification of a service completes, the event comes

ESP_GATTC_UNREGFOR_NOTIFY_EVT = 39
   When unregister for notification of a service completes, the event comes

ESP_GATTC_CONNECT_EVT = 40
   When the BLE physical connection is set up, the event comes

ESP_GATTC_DISCONNECT_EVT = 41
   When the BLE physical connection disconnected, the event comes

ESP_GATTC_READ_MULTIPLE_EVT = 42
   When the BLE characteristic or descriptor multiple complete, the event comes

ESP_GATTCQUEUE_FULL_EVT = 43
   When the GATT command queue full, the event comes

ESP_GATTC_SET_ASSOC_EVT = 44
   When the BLE GATTC set the associated address complete, the event comes

ESP_GATTC_GET_ADDR_LIST_EVT = 45
   When the BLE get GATT address list in cache finish, the event comes

ESP_GATTC_DIS_SRVC_CMPL_EVT = 46
   When the BLE discover service complete, the event comes

BLUFI API

Overview

BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.

2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

Application Example

Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - bluetooth/bluedroid/ble/blufi

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_blufi_api.h
Functions

**esp_err_t esp_blufi_register_callbacks (esp_blufi_callbacks_t *callbacks)**
This function is called to receive blufi callback event.

Return ESP_OK - success, other - failed

Parameters
- callbacks: callback functions

**esp_err_t esp_blufi_profile_init (void)**
This function is called to initialize blufi_profile.

Return ESP_OK - success, other - failed

**esp_err_t esp_blufi_profile_deinit (void)**
This function is called to de-initialize blufi_profile.

Return ESP_OK - success, other - failed

**esp_err_t esp_blufi_send_wifi_conn_report (wifi_mode_t opmode, esp_blufi_sta_conn_state_t sta_conn_state, uint8_t softap_conn_num, esp_blufi_extra_info_t *extra_info)**
This function is called to send wifi connection report.

Return ESP_OK - success, other - failed

Parameters
- opmode: wifi opmode
- sta_conn_state: station is already in connection or not
- softap_conn_num: softap connection number
- extra_info: extra information, such as sta_ssid, softap_ssid and etc.

**esp_err_t esp_blufi_send_wifi_list (uint16_t apCount, esp_blufi_ap_record_t *list)**
This function is called to send wifi list.

Return ESP_OK - success, other - failed

Parameters
- apCount: wifi list count
- list: wifi list

**uint16_t esp_blufi_get_version (void)**
Get BLUFI profile version.

Return Most 8bit significant is Great version, Least 8bit is Sub version

**esp_err_t esp_blufi_close (esp_gatt_if_t gatts_if, uint16_t conn_id)**
Close a connection a remote device.

Return
• ESP_OK : success
• other : failed

Parameters
  • gatts_if: GATT server access interface
  • conn_id: connection ID to be closed.

`esp_err_t esp_blufi_send_error_info (esp_blufi_error_state_t state)`
This function is called to send blufi error information.

  Return ESP_OK - success, other - failed

Parameters
  • state: : error state

`esp_err_t esp_blufi_send_custom_data (uint8_t *data, uint32_t data_len)`
This function is called to custom data.

  Return ESP_OK - success, other - failed

Parameters
  • data: : custom data value
  • data_len: : the length of custom data

    is max connection number of softap interface set

uint8_t *softap_channel
    channel of softap interface

bool softap_channel_set
    is channel of softap interface set

struct esp_blufi_ap_record_t
    Description of an WiFi AP.

Public Members

uint8_t ssid[33]
    SSID of AP

int8_t rssi
    signal strength of AP

struct esp_blufi_callbacks_t
    BLUFI callback functions type.

Public Members

esp_blufi_event_cb_t event_cb
    BLUFI event callback

esp_blufi_negotiate_data_handler_t negotiate_data_handler
    BLUFI negotiate data function for negotiate share key

esp_blufi_encrypt_func_t encrypt_func
    BLUFI encrypt data function with share key generated by negotiate_data_handler

esp_blufi_decrypt_func_t decrypt_func
    BLUFI decrypt data function with share key generated by negotiate_data_handler

esp_blufi_checksum_func_t checksum_func
    BLUFI check sum function (FCS)
Type Definitions

```c
typedef void (*esp_blufi_event_cb_t)(esp_blufi_cb_event_t event, esp_blufi_cb_param_t *param)
```

BLUFI event callback function type.

**Parameters**

- `event`: Event type
- `param`: Point to callback parameter, currently is union type

```c
typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t **output_data, int *output_len, bool *need_free)
```

BLUFI negotiate data handler.

**Parameters**

- `data`: data from phone
- `len`: length of data from phone
- `output_data`: data want to send to phone
- `output_len`: length of data want to send to phone

```c
typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
```

BLUFI encrypt the data after negotiate a share key.

**Return** Nonnegative number is encrypted length, if error, return negative number;

**Parameters**

- `iv8`: initial vector(8bit), normally, blufi core will input packet sequence number
- `crypt_data`: plain text and encrypted data, the encrypt function must support autochthonous encrypt
- `crypt_len`: length of plain text

```c
typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
```

BLUFI decrypt the data after negotiate a share key.

**Return** Nonnegative number is decrypted length, if error, return negative number;

**Parameters**

- `iv8`: initial vector(8bit), normally, blufi core will input packet sequence number
- `crypt_data`: encrypted data and plain text, the encrypt function must support autochthonous decrypt
- `crypt_len`: length of encrypted text

```c
typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)
```

BLUFI checksum.

**Parameters**

- `iv8`: initial vector(8bit), normally, blufi core will input packet sequence number
• data: data need to checksum
• len: length of data

Enumerations

enum esp_blufi_cb_event_t

Values:

- ESP_BLUFI_EVENT_INIT_FINISH = 0
- ESP_BLUFI_EVENT_DEINIT_FINISH
- ESP_BLUFI_EVENT_SET_WIFI_OPMODE
- ESP_BLUFI_EVENT_BLE_CONNECT
- ESP_BLUFI_EVENT_BLE_DISCONNECT
- ESP_BLUFI_EVENT_REQ_CONNECT_TO_AP
- ESP_BLUFI_EVENT_REQ_DISCONNECT_FROM_AP
- ESP_BLUFI_EVENT_GET_WIFI_STATUS
- ESP_BLUFI_EVENT_DEAUTHENTICATE_STA
- ESP_BLUFI_EVENT_RECV_STA_BSSID
- ESP_BLUFI_EVENT_RECV_STA_SSID
- ESP_BLUFI_EVENT_RECV_STA_PASSWD
- ESP_BLUFI_EVENT_RECV_SOFTAP_SSID
- ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD
- ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM
- ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE
- ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL
- ESP_BLUFI_EVENT_RECV_USERNAME
- ESP_BLUFI_EVENT_RECV_CA_CERT
- ESP_BLUFI_EVENT_RECV_CLIENT_CERT
- ESP_BLUFI_EVENT_RECV_SERVER_CERT
- ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY
- ESP_BLUFI_EVENT_RECV_SERVER_PRIV_KEY
- ESP_BLUFI_EVENT_RECV_SLAVE_DISCONNECT_BLE
- ESP_BLUFI_EVENT_GET_WIFI_LIST
- ESP_BLUFI_EVENT_REPORT_ERROR
- ESP_BLUFI_EVENT_RECV_CUSTOM_DATA

enum esp_blufi_sta_conn_state_t

BLUFI config status.

Values:
ESP_BLUFI_STA_CONN_SUCCESS = 0x00
ESP_BLUFI_STA_CONN_FAIL = 0x01

def esp_blufi_init_state_t
  BLUFI init status.
  Values:
  ESP_BLUFI_INIT_OK = 0
  ESP_BLUFI_INIT_FAILED

def esp_blufi_deinit_state_t
  BLUFI deinit status.
  Values:
  ESP_BLUFI_DEINIT_OK = 0
  ESP_BLUFI_DEINIT_FAILED

def esp_blufi_error_state_t
  Values:
  ESP_BLUFI_SEQUENCE_ERROR = 0
  ESP_BLUFI_CHECKSUM_ERROR
  ESP_BLUFI_DECRYPT_ERROR
  ESP_BLUFI_ENCRYPT_ERROR
  ESP_BLUFI_INIT_SECURITY_ERROR
  ESP_BLUFI_DH_MALLOC_ERROR
  ESP_BLUFI_DH_PARAM_ERROR
  ESP_BLUFI_READ_PARAM_ERROR
  ESP_BLUFI_MAKE_PUBLIC_ERROR
  ESP_BLUFI_DATA_FORMAT_ERROR

2.1.4 CLASSIC BT

CLASSIC BLUETOOTH GAP API

Overview

Instructions

Application Example

Instructions
API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_gap_bt_api.h

Functions

```c
static uint32_t esp_bt_gap_get_cod_svc(uint32_t cod)
get major service field of COD

Return major service bits

Parameters
  • cod: Class of Device
```

```c
static uint32_t esp_bt_gap_get_cod_major_dev(uint32_t cod)
get major device field of COD

Return major device bits

Parameters
  • cod: Class of Device
```

```c
static uint32_t esp_bt_gap_get_cod_minor_dev(uint32_t cod)
get minor service field of COD

Return minor service bits

Parameters
  • cod: Class of Device
```

```c
static uint32_t esp_bt_gap_get_cod_format_type(uint32_t cod)
get format type of COD

Return format type

Parameters
  • cod: Class of Device
```

```c
static bool esp_bt_gap_is_valid_cod(uint32_t cod)
decide the integrity of COD

Return
  • true if cod is valid
  • false otherwise

Parameters
  • cod: Class of Device
```
esp_err_t esp_bt_gap_register_callback (esp_bt_gap_cb_t callback)

register callback function. This function should be called after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK : Succeed
- ESP_FAIL: others

esp_err_t esp_bt_gap_set_scan_mode (esp_bt_connection_mode_t c_mode, esp_bt_discovery_mode_t d_mode)

Set discoverability and connectability mode for legacy bluetooth. This function should be called after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK : Succeed
- ESP_ERR_INVALID_ARG: if argument invalid
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- c_mode: : one of the enums of esp_bt_connection_mode_t
- d_mode: : one of the enums of esp_bt_discovery_mode_t

esp_err_t esp_bt_gap_start_discovery (esp_bt_inq_mode_t mode, uint8_t inq_len, uint8_t num_rsps)

Start device discovery. This function should be called after esp_bluedroid_enable() completes successfully. esp bt_gap_cb_t will be called with ESP_BT_GAP_DISC_STATE_CHANGED_EVT if discovery is started or halted. esp bt_gap_cb_t will be called with ESP_BT_GAP_DISC_RES_EVT if discovery result is got.

Return

- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if invalid parameters are provided
- ESP_FAIL: others

Parameters

- mode: - inquiry mode
- inq_len: - inquiry duration in 1.28 sec units, ranging from 0x01 to 0x30
- num_rsps: - number of inquiry responses that can be received, value 0 indicates an unlimited number of responses

esp_err_t esp_bt_gap_cancel_discovery (void)

Cancel device discovery. This function should be called after esp_bluedroid_enable() completes successfully esp bt_gap_cb_t will be called with ESP_BT_GAP_DISC_STATE_CHANGED_EVT if discovery is stopped.

Return

- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
esp_err_t esp_bt_gap_get_remote_services(esp_bd_addr_t remote_bda)
Start SDP to get remote services. This function should be called after esp_bluedroid_enable() completes successfully. esp_bt_gap_cb_t will be called with ESP_BT_GAP_RMT_SRVCS_EVT after service discovery ends.

Return

• ESP_OK : Succeed
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_bt_gap_get_remote_service_record(esp_bd_addr_t remote_bda, esp_bt_uuid_t *uuid)
Start SDP to look up the service matching uuid on the remote device. This function should be called after esp_bluedroid_enable() completes successfully.

esp_bt_gap_cb_t will be called with ESP_BT_GAP_RMT_SRVC_REC_EVT after service discovery ends

Return

• ESP_OK : Succeed
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

uint8_t *esp_bt_gap_resolve_eir_data(uint8_t *eir, esp_bt_eir_type_t type, uint8_t *length)
This function is called to get EIR data for a specific type.

Return  pointer of starting position of eir data excluding eir data type, NULL if not found

Parameters

• eir: - pointer of raw eir data to be resolved
• type: - specific EIR data type
• length: - return the length of EIR data excluding fields of length and data type

esp_err_t esp_bt_gap_config_eir_data(esp_bt_eir_data_t *eir_data)
This function is called to config EIR data.

esp_bt_gap_cb_t will be called with ESP_BT_GAP_CONFIG_EIR_DATA_EVT after config EIR ends.

Return

• ESP_OK : Succeed
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_ERR_INVALID_ARG: if param is invalid
• ESP_FAIL: others

Parameters

• eir_data: - pointer of EIR data content
esp_err_t esp_bt_gap_set_cod(esp_bt_cod_t cod, esp_bt_cod_mode_t mode)

This function is called to set class of device. esp.bt_gap_cb will be called with ESP_BT_GAP_SET_COD_EVT after set COD ends. Some profile have special restrictions on class of device, changes may cause these profile do not work.

Return

• ESP_OK : Succeed
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_ERR_INVALID_ARG: if param is invalid
• ESP_FAIL: others

Parameters

• cod: - class of device
• mode: - setting mode

esp_err_t esp_bt_gap_get_cod(esp_bt_cod_t *cod)

This function is called to get class of device.

Return

• ESP_OK : Succeed
• ESP_FAIL: others

Parameters

• cod: - class of device

esp_err_t esp_bt_gap_read_rssi_delta(esp_bd_addr_t remote_addr)

This function is called to read RSSI delta by address after connected. The RSSI value returned by ESP_BT_GAP_READ_RSSI_DELTA_EVT.

Return

• ESP_OK : Succeed
• ESP_FAIL: others

Parameters

• remote_addr: - remote device address, corresponding to a certain connection handle.

esp_err_t esp_bt_gap_remove_bond_device(esp_bd_addr_t bd_addr)

Removes a device from the security database list of peer device.

Return

- ESP_OK : success
• ESP_FAIL : failed

Parameters

• bd_addr: - BD address of the peer device

int esp_bt_gap_get_bond_device_num(void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

2.1. Bluetooth API 235
Return - >= 0 : bonded devices number.

  • ESP_FAIL : failed

**esp_err_t esp_bt_gap_get_bond_device_list (int *dev_num, esp_bd_addr_t *dev_list)**

Get the device from the security database list of peer device. It will return the device bonded information immediately.

Return

  • ESP_OK : Succeed
  • ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  • ESP_FAIL: others

Parameters

  • dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
  • dev_list: an array(buffer) of esp_bd_addr_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

**esp_err_t esp_bt_gap_set_pin (esp_bt_pin_type_t pin_type, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)**

Set pin type and default pin code for legacy pairing.

Return - ESP_OK : success

  • ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  • other : failed

Parameters

  • pin_type: Use variable or fixed pin. If pin_type is ESP_BT_PIN_TYPE_VARIABLE, pin_code and pin_code_len will be ignored, and ESP_BT_GAP_PINREQ_EVT will come when control requests for pin code. Else, will use fixed pin code and not callback to users.
  • pin_code_len: Length of pin_code
  • pin_code: Pin_code

**esp_err_t esp_bt_gap_pin_reply (esp_bd_addr_t bd_addr, bool accept, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)**

Reply the pin_code to the peer device for legacy pairing when ESP_BT_GAP_PIN_REQ_EVT is coming.

Return - ESP_OK : success

  • ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  • other : failed

Parameters

  • bd_addr: BD address of the peer
  • accept: Pin_code reply successful or declined.
  • pin_code_len: Length of pin_code
  • pin_code: Pin_code
**esp_err_t esp_bt_gap_set_security_param** *(esp_bt_sp_param_t param_type, void *value, uint8_t len)*

Set a GAP security parameter value. Overrides the default value.

**Return**
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**Parameters**
- param_type: the type of the param which is to be set
- value: the param value
- len: the length of the param value

**esp_err_t esp_bt_gap_ssp_passkey_reply** *(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)*

Reply the key value to the peer device in the legacy connection stage.

**Return**
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**Parameters**
- bd_addr: BD address of the peer
- accept: passkey entry successful or declined.
- passkey: passkey value, must be a 6 digit number, can be lead by 0.

**esp_err_t esp_bt_gap_ssp_confirm_reply** *(esp_bd_addr_t bd_addr, bool accept)*

Reply the confirm value to the peer device in the legacy connection stage.

**Return**
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**Parameters**
- bd_addr: BD address of the peer device
- accept: numbers to compare are the same or different.

**esp_err_t esp_bt_gap_set_afh_channels** *(esp_bt_gap_afh_channels channels)*

Set the AFH channels.

**Return**
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**Parameters**
- channels: The n th such field (in the range 0 to 78) contains the value for channel n : 0 means channel n is bad. 1 means channel n is unknown. The most significant bit is reserved and shall be set to 0. At least 20 channels shall be marked as unknown.
esp_err_t esp_bt_gap_read_remote_name(esp_bd_addr_t remote_bda)

Read the remote device name.

Return - ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

Parameters
- remote_bda: The remote device’s address

Unions

union esp_bt_gap_cb_param_t
#include <esp_gap_bt_api.h> A2DP state callback parameters.

Public Members

passkey notif parameter struct

struct esp_bt_gap_cb_param_t::key_req_param key_req
passkey request parameter struct

struct esp_bt_gap_cb_param_t::set_afh_channels_param set_afh_channels
set AFH channel parameter struct

struct esp_bt_gap_cb_param_t::read_rmt_name_param read_rmt_name
read Remote Name parameter struct

struct auth_cmpl_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_AUTH_CMPL_EVT.
Public Members

`esp_bd_addr_t bda`
remote bluetooth device address

`esp_bt_status_t stat`
authentication complete status

uint8_t `device_name[ESP_BT_GAP_MAX_BDNAME_LEN + 1]`
device name

`struct cfm_req_param`
#include <esp_gap_bt_api.h> ESP_BT_GAP_CFM_REQ_EVT.

Public Members

`esp_bd_addr_t bda`
remote bluetooth device address

uint32_t `num_val`
the numeric value for comparison.

`struct config_eir_data_param`
#include <esp_gap_bt_api.h> ESP_BT_GAP_CONFIG_EIR_DATA_EVT *.

Public Members

`esp_bt_status_t stat`
config EIR status: ESP_BT_STATUS_SUCCESS: config success
ESP_BT_STATUS_EIR_TOO_LARGE: the EIR data is more than 240B. The EIR may not
contain the whole data. others: failed

uint8_t `eir_type_num`
the number of EIR types in EIR type

`esp_bt_eir_type_t eir_type[ESP_BT_EIR_TYPE_MAX_NUM]`
EIR types in EIR type

`struct disc_res_param`
#include <esp_gap_bt_api.h> ESP_BT_GAP_DISC_RES_EVT.

Public Members

`esp_bd_addr_t bda`
remote bluetooth device address

int `num_prop`
number of properties got

`esp_bt_gap_dev_prop_t *prop`
properties discovered from the new device

`struct disc_state_changed_param`
#include <esp_gap_bt_api.h> ESP_BT_GAP_DISC_STATE_CHANGED_EVT.
Public Members

    esp_bt_gap_discovery_state_t state
        discovery state

struct key_notif_param
    #include <esp_gap_bt_api.h> ESP_BT_GAP_KEY_NOTIF_EVT.

Public Members

    esp_bd_addr_t bda
        remote bluetooth device address

    uint32_t passkey
        the numeric value for passkey entry.

struct key_req_param

Bluetooth Device Property Descriptor.

Public Members

- `esp_bt_gap_dev_prop_type_t type` device property type
- `int len` device property value length
- `void *val` device property value

**struct esp_bt_eir_data_t**
EIR data content, according to “Supplement to the Bluetooth Core Specification”.

Public Members

- `bool fec_required` FEC is required or not, true by default
- `bool include_txpower` EIR data include TX power, false by default
- `bool include_uuid` EIR data include UUID, false by default
- `uint8_t flag` EIR flags, see ESP_BT_EIR_FLAG for details, EIR will not include flag if it is 0, 0 by default
- `uint16_t manufacturer_len` Manufacturer data length, 0 by default
- `uint8_t *p_manufacturer_data` Manufacturer data point
- `uint16_t url_len` URL length, 0 by default
- `uint8_t *p_url` URL point
Macros

ESP_BT_GAP_RSSI_HIGH_THRLD
RSSI threshold.
High RSSI threshold

ESP_BT_GAP_RSSI_LOW_THRLD
Low RSSI threshold

ESP_BT_GAP_AFH_CHANNELS_LEN

ESP_BT_GAP_MAX_BDNAME_LEN
Maximum bytes of Bluetooth device name.

ESP_BT_GAP_EIR_DATA_LEN
Maximum size of EIR Significant part.

ESP_BT_EIR_TYPE_FLAGS
Extended Inquiry Response data type.
Flag with information such as BR/EDR and LE support

ESP_BT_EIR_TYPE_INCMPL_16BITS_UUID
Incomplete list of 16-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_16BITS_UUID
Complete list of 16-bit service UUIDs

ESP_BT_EIR_TYPE_INCMPL_32BITS_UUID
Incomplete list of 32-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_32BITS_UUID
Complete list of 32-bit service UUIDs

ESP_BT_EIR_TYPE_INCMPL_128BITS_UUID
Incomplete list of 128-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_128BITS_UUID
Complete list of 128-bit service UUIDs

ESP_BT_EIR_TYPE_SHORT_LOCAL_NAME
Shortened Local Name

ESP_BT_EIR_TYPE_CMPL_LOCAL_NAME
Complete Local Name

ESP_BT_EIR_TYPE_TX_POWER_LEVEL
Tx power level, value is 1 octet ranging from -127 to 127, unit is dBm

ESP_BT_EIR_TYPE_URL
Uniform resource identifier

ESP_BT_EIR_TYPE_MANU_SPECIFIC
Manufacturer specific data

ESP_BT_EIR_TYPE_MAX_NUM
MAX number of EIR type

ESP_BT_EIR_FLAG_LIMIT_DISC

ESP_BT_EIR_FLAG_GEN_DISC

ESP_BT_EIR_FLAG_BREDR_NOT_SPT

2.1. Bluetooth API
ESP_BT_EIR_FLAG_DMT_CONTROLLER_SPT
ESP_BT_EIR_FLAG_DMT_HOST_SPT
ESP_BT_EIR_MAX_LEN
ESP_BT_PIN_CODE_LEN
    Max pin code length
ESP_BT_IO_CAP_OUT
ESP_BT_IO_CAP_IO
ESP_BT_IO_CAP_IN
ESP_BT_IO_CAP_NONE
ESP_BT_COD_SRVC_BIT_MASK
    Bits of major service class field.
    Major service bit mask
ESP_BT_COD_SRVC_BIT_OFFSET
    Major service bit offset
ESP_BT_COD_MAJOR_DEV_BIT_MASK
    Bits of major device class field.
    Major device bit mask
ESP_BT_COD_MAJOR_DEV_BIT_OFFSET
    Major device bit offset
ESP_BT_COD_MINOR_DEV_BIT_MASK
    Bits of minor device class field.
    Minor device bit mask
ESP_BT_COD_MINOR_DEV_BIT_OFFSET
    Minor device bit offset
ESP_BT_COD_FORMAT_TYPE_BIT_MASK
    Bits of format type.
    Format type bit mask
ESP_BT_COD_FORMAT_TYPE_BIT_OFFSET
    Format type bit offset
ESP_BT_COD_FORMAT_TYPE_1
    Class of device format type 1.
ESP_BT_GAP_MIN_INQ_LEN
    Minimum and Maximum inquiry length Minimum inquiry duration, unit is 1.28s
ESP_BT_GAP_MAX_INQ_LEN
    Maximum inquiry duration, unit is 1.28s

Type Definitions

typedef uint8_t esp_bt_gap_afh_channels[ESP_BT_GAP_AFH_CHANNELS_LEN]
typedef uint8_t esp_bt_eir_type_t
typedef uint8_t esp_bt_pin_code_t[ESP_BT_PIN_CODE_LEN]
Pin Code (upto 128 bits) MSB is 0

typedef uint8_t esp_bt_io_cap_t
combination of the io capability

typedef void (*esp_bt_gap_cb_t)(esp_bt_gap_cb_event_t event, esp_bt_gap_cb_param_t *param)
bluetooth GAP callback function type

Parameters

• event: : Event type
• param: : Pointer to callback parameter

Enumerations

enum esp_bt_cod_mode_t
class of device settings

Values:

ESP_BT_SET_COD_MAJOR_MINOR = 0x01
overwrite major, minor class

ESP_BT_SET_COD_SERVICE_CLASS = 0x02
set the bits in the input, the current bit will remain

ESP_BT_CLR_COD_SERVICE_CLASS = 0x04
clear the bits in the input, others will remain

ESP_BT_SET_COD_ALL = 0x08
overwrite major, minor, set the bits in service class

ESP_BT_INIT_COD = 0x0a
overwrite major, minor, and service class

enum esp_bt_connection_mode_t
Discoverability and Connectability mode.

Values:

ESP_BT_NON_CONNECTABLE
Non-connectable

ESP_BT_CONNECTABLE
Connectable

enum esp_bt_discovery_mode_t
Values:

ESP_BT_NON_DISCOVERABLE
Non-discoverable

ESP_BT_LIMITED_DISCOVERABLE
Limited Discoverable

ESP_BT_GENERAL_DISCOVERABLE
General Discoverable

enum esp_bt_gap_dev_prop_type_t
Bluetooth Device Property type.
Values:

```c
ESP_BT_GAP_DEV_PROP_BDNAME = 1
    Bluetooth device name, value type is int8_t []
ESP_BT_GAP_DEV_PROP_COD
    Class of Device, value type is uint32_t
ESP_BT_GAP_DEV_PROP_RSSI
    Received Signal strength Indication, value type is int8_t, ranging from -128 to 127
ESP_BT_GAP_DEV_PROP_EIR
    Extended Inquiry Response, value type is uint8_t []
```

```c
enum esp_bt_cod_srvc_t
    Major service class field of Class of Device, multiple bits can be set.
Values:
ESP_BT_COD_SRVC_NONE = 0
    None indicates an invalid value
ESP_BT_COD_SRVC_LMTD_DISCOVER = 0x1
    Limited Discoverable Mode
ESP_BT_COD_SRVC_POSITIONING = 0x8
    Positioning (Location identification)
ESP_BT_COD_SRVC_NETWORKING = 0x10
    Networking, e.g. LAN, Ad hoc
ESP_BT_COD_SRVC_RENDERING = 0x20
    Rendering, e.g. Printing, Speakers
ESP_BT_COD_SRVC_CAPTURING = 0x40
    Capturing, e.g. Scanner, Microphone
ESP_BT_COD_SRVC_OBJ_TRANSFER = 0x80
    Object Transfer, e.g. v-Inbox, v-Folder
ESP_BT_COD_SRVC_AUDIO = 0x100
    Audio, e.g. Speaker, Microphone, Headset service
ESP_BT_COD_SRVC_TELEPHONY = 0x200
    Telephony, e.g. Cordless telephony, Modem, Headset service
ESP_BT_COD_SRVC_INFORMATION = 0x400
    Information, e.g., WEB-server, WAP-server
```

```c
enum esp_bt_pin_type_t
    Values:
ESP_BT_PIN_TYPE_VARIABLE = 0
    Refer to BTM_PIN_TYPE_VARIABLE
ESP_BT_PIN_TYPE_FIXED = 1
    Refer to BTM_PIN_TYPE_FIXED
```

```c
enum esp_bt_sp_param_t
    Values:
ESP_BT_SP_IOCAP_MODE = 0
    Set IO mode
enum esp_bt_cod_major_dev_t
    Major device class field of Class of Device.
    Values:
    ESP_BT_COD_MAJOR_DEV_MISC = 0
        Miscellaneous
    ESP_BT_COD_MAJOR_DEV_COMPUTER = 1
        Computer
    ESP_BT_COD_MAJOR_DEV_PHONE = 2
        Phone(cellular, cordless, pay phone, modem
    ESP_BT_COD_MAJOR_DEV_LAN_NAP = 3
        LAN, Network Access Point
    ESP_BT_COD_MAJOR_DEV_AV = 4
        Audio/Video(headset, speaker, stereo, video display, VCR
    ESP_BT_COD_MAJOR_DEV_PERIPHERAL = 5
        Peripheral(mouse, joystick, keyboard)
    ESP_BT_COD_MAJOR_DEV_IMAGING = 6
        Imaging(printer, scanner, camera, display
    ESP_BT_COD_MAJOR_DEV_WEARABLE = 7
        Wearable
    ESP_BT_COD_MAJOR_DEV_TOY = 8
        Toy
    ESP_BT_COD_MAJOR_DEV_HEALTH = 9
        Health
    ESP_BT_COD_MAJOR_DEV_UNCATEGORIZED = 31
        Uncategorized: device not specified

enum esp_bt_gap_discovery_state_t
    Bluetooth Device Discovery state
    Values:
    ESP_BT_GAP_DISCOVERY_STOPPED
        device discovery stopped
    ESP_BT_GAP_DISCOVERY_STARTED
        device discovery started

enum esp_bt_gap_cb_event_t
    BT GAP callback events.
    Values:
    ESP_BT_GAP_DISC_RES_EVT = 0
        device discovery result event
    ESP_BT_GAP_DISC_STATE_CHANGED_EVT
        discovery state changed event
    ESP_BT_GAP_RMT_SRVCS_EVT
        get remote services event
    ESP_BT_GAP_RMT_SRVC_REC_EVT
        get remote service record event
ESP_BT_GAP_AUTH_CMPL_EVT
AUTH complete event

ESP_BT_GAP_PIN_REQ_EVT
Legacy Pairing Pin code request

ESP_BT_GAP_CFMRQ_EVT
Simple Pairing User Confirmation request.

ESP_BT_GAP_KNCP_EVT
Simple Pairing Passkey Notification

ESP_BT_GAP_KEY_REQ_EVT
Simple Pairing Passkey request

ESP_BT_GAP_READ_RSSI_DELTA_EVT
read rssi event

ESP_BT_GAP_CONFIG_EIR_DATA_EVT
config EIR data event

ESP_BT_GAP_SET_AFH_CHANNELS_EVT
set AFH channels event

ESP_BT_GAP_READ_REMOTE_NAME_EVT
read Remote Name event

ESP_BT_GAP_EVT_MAX

enum esp_bt_inq_mode_t
  Inquiry Mode
  Values:
  ESP_BT_INQ_MODE_GENERAL_INQUIRY
    General inquiry mode
  ESP_BT_INQ_MODE_LIMITED_INQUIRY
    Limited inquiry mode

Bluetooth A2DP API

Overview

Instructions

Application Example

Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is a A2DP sink client demo. This demo can be discovered and connected by A2DP source device and receive the audio stream from remote device - bluetooth/bluedroid/classic_bt/a2dp_sink

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_a2dp_api.h
Functions

`esp_err_t esp_a2d_register_callback (esp_a2d_cb_t callback)`

Register application callback function to A2DP module. This function should be called only after esp_bluedroid_enable() completes successfully, used by both A2DP source and sink.

**Return**

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

**Parameters**

- callback: A2DP event callback function

`esp_err_t esp_a2d_sink_register_data_callback (esp_a2d_sink_data_cb_t callback)`

Register A2DP sink data output function; For now the output is PCM data stream decoded from SBC format. This function should be called only after esp_bluedroid_enable() completes successfully, used only by A2DP sink. The callback is invoked in the context of A2DP sink task whose stack size is configurable through menu-config.

**Return**

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

**Parameters**

- callback: A2DP sink data callback function

`esp_err_t esp_a2d_sink_init (void)`

Initialize the bluetooth A2DP sink module. This function should be called after esp_bluedroid_enable() completes successfully.

**Return**

- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_sink_deinit (void)`

De-initialize for A2DP sink module. This function should be called only after esp_bluedroid_enable() completes successfully.

**Return**

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_sink_connect (esp_bd_addr_t remote_bda)`

Connect to remote bluetooth A2DP source device, must after esp_a2d_sink_init()
Return

- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- remote_bda: remote bluetooth device address

`esp_err_t esp_a2d_sink_disconnect(esp_bd_addr_t remote_bda)`

Disconnect from the remote A2DP source device.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- remote_bda: remote bluetooth device address

`esp_err_t esp_a2d_media_ctrl(esp_a2d_media_ctrl_t ctrl)`

media control commands; this API can be used for both A2DP sink and source

Return

- ESP_OK: control command is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- ctrl: control commands for A2DP data channel

`esp_err_t esp_a2d_source_init(void)`

Initialize the bluetooth A2DP source module. This function should be called after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_source_deinit(void)`

De-initialize for A2DP source module. This function should be called only after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
esp_err_t esp_a2d_source_register_data_callback (esp_a2d_source_data_cb_t callback)

Register A2DP source data input function; For now the input is PCM data stream. This function should be called only after esp_bluedroid_enable() completes successfully. The callback is invoked in the context of A2DP source task whose stack size is configurable through menuconfig.

Return

• ESP_OK: success
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: if callback is a NULL function pointer

Parameters

• callback: A2DP source data callback function

esp_err_t esp_a2d_source_connect (esp_bd_addr_t remote_bda)

Connect to remote A2DP sink device, must after esp_a2d_source_init()

Return

• ESP_OK: connect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters

• remote_bda: remote bluetooth device address

esp_err_t esp_a2d_source_disconnect (esp_bd_addr_t remote_bda)

Disconnect from the remote A2DP sink device.

Return

• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters

• remote_bda: remote bluetooth device address

Unions

union esp_a2d_cb_param_t
#include <esp_a2dp_api.h> A2DP state callback parameters.

Public Members

struct esp_a2d_cb_param_t::a2d_conn_stat_param conn_stat
A2DP connection status
struct esp_a2d_cb_param_t::a2d_audio_stat_param audio_stat
    audio stream playing state

struct esp_a2d_cb_param_t::a2d_audio_cfg_param audio_cfg
    media codec configuration information

struct esp_a2d_cb_param_t::media_ctrl_stat_param media_ctrl_stat
    status in acknowledgement to media control commands

struct a2d_audio_cfg_param
    #include <esp_a2dp_api.h> ESP_A2D_AUDIO_CFG_EVT.

Public Members

    esp_bd_addr_t remote_bda
        remote bluetooth device address
    esp_a2d_mcc_t mcc
        A2DP media codec capability information

struct a2d_audio_stat_param
    #include <esp_a2dp_api.h> ESP_A2D_AUDIO_STATE_EVT.

Public Members

    esp_a2d_audio_state_t state
        one of the values from esp_a2d_audio_state_t
    esp_bd_addr_t remote_bda
        remote bluetooth device address

struct a2d_conn_stat_param
    #include <esp_a2dp_api.h> ESP_A2D_CONNECTION_STATE_EVT.

Public Members

    esp_a2d_connection_state_t state
        one of values from esp_a2d_connection_state_t
    esp_bd_addr_t remote_bda
        remote bluetooth device address
    esp_a2d_disc_rsn_t disc_rsn
        reason of disconnection for “DISCONNECTED”

struct media_ctrl_stat_param
    #include <esp_a2dp_api.h> ESP_A2D_MEDIA_CTRL_ACK_EVT.

Public Members

    esp_a2d_media_ctrl_t cmd
        media control commands to acknowledge
    esp_a2d_media_ctrl_ack_t status
        acknowledgement to media control commands
Structures

**struct esp_a2d_mcc_t**
A2DP media codec capabilities union.

**Public Members**

```c
typedef esp_a2d_mct_t type
A2DP media codec type

union esp_a2d_mcc_t::[anonymous] cie
A2DP codec information element
```

**Macros**

```c
ESP_A2D_MCT_SBC
Media codec types supported by A2DP.
SBC

ESP_A2D_MCT_M12
MPEG-1, 2 Audio

ESP_A2D_MCT_M24
MPEG-2, 4 AAC

ESP_A2D_MCT_ATRAC
ATRAC family

ESP_A2D_MCT_NON_A2DP

ESP_A2D_CIE_LEN_SBC
ESP_A2D_CIE_LEN_M12
ESP_A2D_CIE_LEN_M24
ESP_A2D_CIE_LEN_ATRAC
```

**Type Definitions**

```c
typedef uint8_t esp_a2d_mct_t
```

```c
typedef void (*esp_a2d_cb_t)(esp_a2d_cb_event_t event, esp_a2d_cb_param_t *param)
A2DP profile callback function type.
```

**Parameters**

- **event**: Event type
- **param**: Pointer to callback parameter

```c
typedef void (*esp_a2d_sink_data_cb_t)(const uint8_t *buf, uint32_t len)
A2DP profile data callback function.
```

**Parameters**
buf: data received from A2DP source device and is PCM format decoder from SBC decoder; buf
references to a static memory block and can be overwritten by upcoming data

len: size(in bytes) in buf

typedef int32_t (*esp_a2d_source_data_cb_t) (uint8_t *buf, int32_t len)
A2DP source data read callback function.

Return size of bytes read successfully, if the argument len is -1, this value is ignored.

Parameters

* buf: buffer to be filled with PCM data stream from higher layer
* len: size(in bytes) of data block to be copied to buf. -1 is an indication to user that data buffer shall
be flushed

Enumerations

define esp_a2d_connection_state_t
Bluetooth A2DP connection states.

Values:

ESP_A2D_CONNECTION_STATE_DISCONNECTED = 0
connection released

ESP_A2D_CONNECTION_STATE_CONNECTING
connecting remote device

ESP_A2D_CONNECTION_STATE_CONNECTED
connection established

ESP_A2D_CONNECTION_STATE_DISCONNECTING
disconnecting remote device

define esp_a2d_disc_rsn_t
Bluetooth A2DP disconnection reason.

Values:

ESP_A2D_DISC_RSN_NORMAL = 0
Finished disconnection that is initiated by local or remote device

ESP_A2D_DISC_RSN_ABNORMAL
Abnormal disconnection caused by signal loss

define esp_a2d_audio_state_t
Bluetooth A2DP datapath states.

Values:

ESP_A2D_AUDIO_STATE_REMOTE_SUSPEND = 0
audio stream datapath suspended by remote device

ESP_A2D_AUDIO_STATE_STOPPED
audio stream datapath stopped

ESP_A2D_AUDIO_STATE_STARTED
audio stream datapath started
enum esp_a2d_media_ctrl_ack_t
A2DP media control command acknowledgement code.
Values:

ESP_A2D_MEDIA_CTRL_ACK_SUCCESS = 0
media control command is acknowledged with success

ESP_A2D_MEDIA_CTRL_ACK_FAILURE
media control command is acknowledged with failure

ESP_A2D_MEDIA_CTRL_ACK_BUSY
media control command is rejected, as previous command is not yet acknowledged

enum esp_a2d_media_ctrl_t
A2DP media control commands.
Values:

ESP_A2D_MEDIA_CTRL_NONE = 0
dummy command

ESP_A2D_MEDIA_CTRL_CHECK_SRC_RDY
check whether AVDTP is connected, only used in A2DP source

ESP_A2D_MEDIA_CTRL_START
command to set up media transmission channel

ESP_A2D_MEDIA_CTRL_STOP
command to stop media transmission

ESP_A2D_MEDIA_CTRL_SUSPEND
command to suspend media transmission

enum esp_a2d_cb_event_t
A2DP callback events.
Values:

ESP_A2D_CONNECTION_STATE_EVT = 0
connection state changed event

ESP_A2D_AUDIO_STATE_EVT
audio stream transmission state changed event

ESP_A2D_AUDIO_CFG_EVT
audio codec is configured, only used for A2DP SINK

ESP_A2D_MEDIA_CTRL_ACK_EVT
acknowledge event in response to media control commands

BT AVRCP APIs

Overview

Bluetooth AVRCP reference APIs.

Instructions
Application Example

Instructions

API Reference

Header File

- bt/host/bluedroid/api/include/api.esp_avrc_api.h

Functions

**esp_err_t esp_avrc_ct_register_callback** *(esp_avrc_ct_cb_t callback)*

Register application callbacks to AVRCP module. This function should be called after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- callback: AVRCP controller callback function

**esp_err_t esp_avrc_ct_init** *(void)*

Initialize the bluetooth AVRCP controller module. This function should be called after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_avrc_ct_deinit** *(void)*

De-initialize AVRCP controller module. This function should be called after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_avrc_ct_send_set_player_value_cmd** *(uint8_t tl, uint8_t attr_id, uint8_t value_id)*

Send player application settings command to AVRCP target. This function should be called after ESP_AVRCP_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters

• tl: transaction label, 0 to 15, consecutive commands should use different values.
• attr_id: player application setting attribute IDs from one of esp_avrc_ps_attr_ids_t
• value_id: attribute value defined for the specific player application setting attribute

`esp_err_t esp_avrc_ct_send_get_rn_capabilities_cmd(uint8_t tl)`
Send GetCapabilities PDU to AVRCP target to retrieve remote device’s supported notification event_ids. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return

• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters

• tl: transaction label, 0 to 15, consecutive commands should use different values.

`esp_err_t esp_avrc_ct_send_register_notification_cmd(uint8_t tl, uint8_t event_id, uint32_t event_parameter)`
Send register notification command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return

• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
• ESP_FAIL: others

Parameters

• tl: transaction label, 0 to 15, consecutive commands should use different values.
• event_id: id of events, e.g. ESP_AVRC_RN_PLAY_STATUS_CHANGE, ESP_AVRC_RN_TRACK_CHANGE, etc.
• event_parameter: playback interval for ESP_AVRC_RN_PLAY_POS_CHANGED; For other events, value of this parameter is ignored.

`esp_err_t esp_avrc_ct_send_set_absolute_volume_cmd(uint8_t tl, uint8_t volume)`
Send set absolute volume command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return

• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled

2.1. Bluetooth API
• ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
• ESP_FAIL: others

Parameters
• tl: transaction label, 0 to 15, consecutive commands should use different values.
• volume: volume, 0 to 0x7f, means 0% to 100%

```
esp_err_t esp_avrc_ct_send_metadata_cmd(uint8_t tl, uint8_t attr_mask)
```

Send metadata command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• tl: transaction label, 0 to 15, consecutive commands should use different values.
• attr_mask: mask of attributes, e.g. ESP_AVRC_MD_ATTR_ID_TITLE | ESP_AVRC_MD_ATTR_ID_ARTIST.

```
esp_err_t esp_avrc_ct_send_passthrough_cmd(uint8_t tl, uint8_t key_code, uint8_t key_state)
```

Send passthrough command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• tl: transaction label, 0 to 15, consecutive commands should use different values.
• key_code: passthrough command code, e.g. ESP_AVRC_PT_CMD_PLAY, ESP_AVRC_PT_CMD_STOP, etc.
• key_state: passthrough command key state, ESP_AVRC_PT_CMD_STATE_PRESSED or ESP_AVRC_PT_CMD_STATE_RELEASED

```
esp_err_t esp_avrc_tg_register_callback(esp_avrc_tg_cb_t callback)
```

Register application callbacks to AVRCP target module; This function should be called after esp_bluedroid_enable() completes successfully.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• callback: AVRCP target callback function

`esp_err_t esp_avrc_tg_init (void)`
Initialize the bluetooth AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_avrc_tg_deinit (void)`
De-initialize AVRCP target module. This function should be called after after esp_bluedroid_enable() completes successfully.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRCP TG is not initialized
- ESP_FAIL: otherwise

`esp_err_t esp_avrc_tg_get_psth_cmd_filter (esp_avrc_psth_filter_t filter, esp_avrc_psth_bit_mask_t *cmd_set)`
Get the current filter of remote passthrough commands on AVRCP target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init(). For filter type ESP_AVRC_PSTH_FILTER_ALLOWED_CMD, the retrieved command set is constant and it covers all of the passthrough commands that can possibly be supported. For filter type ESP_AVRC_PSTH_FILTER_SUPPORT_COMMANDS, the retrieved command set covers the passthrough commands selected to be supported according to current configuration. The configuration can be changed using esp_avrc_tg_set_psth_cmd_filter()

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRCP TG is not initialized
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_FAIL: otherwise

`esp_err_t esp_avrc_tg_set_psth_cmd_filter (esp_avrc_psth_filter_t filter, const esp_avrc_psth_bit_mask_t *cmd_set)`
Set the filter of remote passthrough commands on AVRCP target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init(). If filter type is ESP_AVRC_PSTH_FILTER_SUPPORT_CMD, the passthrough commands which are set “1” as given in cmd_set will generate ESP_AVRC_CT_PASSTHROUGH_RSP_EVT callback event and are auto-accepted in the protocol stack, other commands are replied with response type “NOT IMPLEMENTED” (8). The set of supported commands should be a subset of allowed command set. The allowed command set can be retrieved using esp_avrc_tg_get_psth_cmd_filter() with filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD”. Filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD” does not apply to this function

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_ERR_NOT_SUPPORTED: if filter type is ESP_AVC_PSTH_FILTER_ALLOWED_CMD, or cmd_set includes unallowed commands

`bool esp_avrc_psth_bit_mask_operation(esp_avrc_bit_mask_op_t op, esp_avrc_psth_bit_mask_t *psth, esp_avrc_pt_cmd_t cmd)`

Operate on the type `esp_avrc_psth_bit_mask_t` with regard to a specific PASSTHROUGH command.

**Return** For operation ESP_AVRC_BIT_MASK_OP_SET or ESP_AVRC_BIT_MASK_OP_CLEAR, return true for a successful operation, otherwise return false For operation ESP_AVRC_BIT_MASK_OP_TEST, return true if the corresponding bit is set, otherwise false

**Parameters**
- `op`: operation requested on the bit mask field
- `psth`: pointer to passthrough command bit mask structure
- `cmd`: passthrough command code

`esp_err_t esp_avrc_tg_get_rn_evt_cap(esp_avrc_rn_evt_cap_t cap, esp_avrc_rn_evt_cap_mask_t *evt_set)`

Get the requested event notification capabilities on local AVRC target. The capability is returned in a bit mask representation in `evt_set`. This function should be called after `esp_avrc_tg_init()`. For capability type “ESP_AVRC_RN_CAP_ALLOWED_EVT, the retrieved event set is constant and it covers all of the notification events that can possibly be supported with current implementation. For capability type ESP_AVRC_RN_CAP_SUPPORTED_EVT, the event set covers the notification events selected to be supported under current configuration. The configuration can be changed using `esp_avrc_tg_set_rn_evt_cap()`

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if cap is invalid or `evt_set` is NULL
- ESP_FAIL: otherwise

`esp_err_t esp_avrc_tg_set_rn_evt_cap(const esp_avrc_rn_evt_cap_mask_t *evt_set)`

Set the event notification capabilities on local AVRCP target. The capability is given in a bit mask representation in `evt_set` and must be a subset of allowed event IDs with current implementation. This function should be called after `esp_avrc_tg_init()`.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled
- ESP_ERR_INVALID_ARG: if `evt_set` is NULL

`bool esp_avrc_rn_evt_bit_mask_operation(esp_avrc_bit_mask_op_t op, esp_avrc_rn_evt_cap_mask_t *events, esp_avrc_rn_event_ids_t event_id)`

Operate on the type `esp_avrc_rn_evt_cap_mask_t` with regard to a specific event.
For operation ESP_AVRC_BIT_MASK_OP_SET or ESP_AVRC_BIT_MASK_OP_CLEAR, return true for a successful operation, otherwise return false. For operation ESP_AVRC_BIT_MASK_OP_TEST, return true if the corresponding bit is set, otherwise false.

**Parameters**
- `op`: operation requested on the bit mask field
- `events`: pointer to event notification capability bit mask structure
- `event_id`: notification event code

```c
esp_err_t esp_avrc tg_send_rn_rsp(esp_avrc rn_event_ids_t event_id, esp_avrc rn_rsp_t rsp, esp_avrc rn_param_t *param)
```

Send RegisterNotification Response to remote AVRCP controller. Local event notification capability can be set using `esp_avrc tg_set_rn_evt_cap()`, in a bit mask representation in `evt_set`. This function should be called after `esp_avrc tg_init()`.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRCP TG is not initialized
- ESP_ERR_INVALID_ARG: if `evt_set` is NULL

**Parameters**
- `event_id`: notification event ID that remote AVRCP CT registers
- `rsp`: notification response code
- `param`: parameters included in the specific notification

**Unions**

```c
union esp_avrc rn_param_t
#include <esp_avrc api.h> AVRCP notification parameters.
```

**Public Members**

```c
uint8_t volume
    response data for ESP_AVRC_RN_VOLUME_CHANGE, ranges 0..127
```

```c
esp_avrc playback_stat_t playback
    response data for ESP_AVRC_RN_PLAY_STATUS_CHANGE
```

```c
uint8_telm_id[8]
    response data for ESP_AVRC_RN_TRACK_CHANGE
```

```c
uint32_t play_pos
    response data for ESP_AVRC_RN_PLAY_POS_CHANGED, in millisecond
```

```c
esp_avrc batt_stat_t batt
    response data for ESP_AVRC_RN_BATTERY_STATUS_CHANGE
```

```c
union esp_avrc ct_cb_param_t
#include <esp_avrc api.h> AVRCP controller callback parameters.
```
Public Members

```c
struct esp_avrc_ct_cb_param_t::avrc_ct_conn_stat_param conn_stat
    AVRC connection status
struct esp_avrc_ct_cb_param_t::avrc_ct_psth_rsp_param psth_rsp
    passthrough command response
struct esp_avrc_ct_cb_param_t::avrc_ct_meta_rsp_param meta_rsp
    metadata attributes response
struct esp_avrc_ct_cb_param_t::avrc_ct_change_notify_param change_ntf
    notifications
struct esp_avrc_ct_cb_param_t::avrc_ct_rmt_feats_param rmt_feats
    AVRC features discovered from remote SDP server
struct esp_avrc_ct_cb_param_t::avrc_ct_get_rn_caps_rsp_param get_rn_caps_rsp
    get supported event capabilities response from AVRCP target
struct esp_avrc_ct_cb_param_t::avrc_ct_set_volume_rsp_param set_volume_rsp
    set absolute volume response event
```

Public Members

```c
#include <esp_avrc_api.h>
ESP_A VRC_CT_CHANGE_NOTIFY_EVT.
```

Public Members

```c
uint8_t event_id
    id of AVRC event notification
esp_avrc_rn_param_t event_parameter
    event notification parameter
```

Public Members

```c
#include <esp_avrc_api.h>
ESP_A VRC_CT_CONNECTION_STATE_EVT.
```

Public Members

```c
bool connected
    whether AVRC connection is set up
esp_bd_addr_t remote_bda
    remote bluetooth device address
```

Public Members

```c
#include <esp_avrc_api.h>
ESP_A VRC_CT_GET_RN_CAPABILITIES_RSP_EVT.
```

Public Members

```c
uint8_t cap_count
    number of items provided in event or company_id according to cap_id used
esp_avrc_rn_evt_cap_mask_t evt_set
    supported event_ids represented in bit-mask
```

Public Members

```c
#include <esp_avrc_api.h>
ESP_A VRC_CT_METADATA_RSP_EVT.
```
Public Members

```c
uint8_t attr_id
   id of metadata attribute
uint8_t *attr_text
   attribute itself
int attr_length
   attribute character length
```

```c
struct avrc_ct_psth_rsp_param
   #include <esp_avrc_api.h> ESP_AVRC_CT_PASSTHROUGH_RSP_EVT.
```

Public Members

```c
uint8_t tl
   transaction label, 0 to 15
uint8_t key_code
   passthrough command code
uint8_t key_state
   0 for PRESSED, 1 for RELEASED
```

```c
struct avrc_ct_rmt_feats_param
   #include <esp_avrc_api.h> ESP_AVRC_CT_REMOTE_FEATURES_EVT.
```

Public Members

```c
uint32_t feat_mask
   AVRC feature mask of remote device
uint16_t tg_feat_flag
   feature flag of remote device as TG
esp_bd_addr_t remote_bda
   remote bluetooth device address
```

```c
struct avrc_ct_set_volume_rsp_param
   #include <esp_avrc_api.h> ESP_AVRC_CT_SET_ABSOLUTE_VOLUME_RSP_EVT.
```

Public Members

```c
uint8_t volume
   the volume which has actually been set, range is 0 to 0x7f, means 0% to 100%
```

```c
union esp_avrc_tg_cb_param_t
   #include <esp_avrc_api.h> AVRC target callback parameters.
```

Public Members

```c
struct esp_avrc_tg_cb_param_t::avrc_tg_conn_stat_param conn_stat
   AVRC connection status
```
struct esp_avrc_tg_ch_param_t::avrc_tg_rmt_feats_param rmt_feats
AVRC features discovered through SDP

struct esp_avrc_tg_ch_param_t::avrc_tg_psth_cmd_param psth_cmd
passthrough command

struct esp_avrc_tg_ch_param_t::avrc_tg_set_abs_vol_param set_abs_vol
set absolute volume command targeted on audio sink

struct esp_avrc_tg_ch_param_t::avrc_tg_reg_ntf_param reg_ntf
register notification

struct avrc_tg_conn_stat_param
#include <esp_avrc_api.h> ESP_AVRC_TG_CONNECTION_STATE_EVT.

Public Members

bool connected
whether AVRC connection is set up

esp_bd_addr_t remote_bda
remote bluetooth device address

struct avrc_tg_psth_cmd_param
#include <esp_avrc_api.h> ESP_AVRC_TG_PASSTHROUGH_CMD_EVT.

Public Members

uint8_t key_code
passthrough command code

0 for PRESSED, 1 for RELEASED

struct avrc_tg_reg_ntf_param
#include <esp_avrc_api.h> ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT.

Public Members

uint8_t event_id
event id of AVRC RegisterNotification

uint32_t event_parameter
event notification parameter

struct avrc_tg_rmt_feats_param
#include <esp_avrc_api.h> ESP_AVRC_TG_REMOTE_FEATURES_EVT.

Public Members

uint32_t feat_mask
AVRC feature mask of remote device

uint16_t ct_feat_flag
feature flag of remote device as CT
**esp_bd_addr_t** `remote_bda`
remote bluetooth device address

**struct avrc tg_set_abs_vol_param**
#include <esp_avrc_api.h> ESP_AVRC_TG_SET_ABSOLUTE_VOLUME_CMD_EVT.

**Public Members**

uint8_t `volume`
volume ranges from 0 to 127

**Structures**

**struct esp_avrc_psth_bit_mask_t**
AVRC passthrough command bit mask.

**Public Members**

uint16_t `bits`[8]
bit mask representation of PASSTHROUGH commands

**struct esp_avrc_rn_evt_cap_mask_t**
AVRC target notification event capability bit mask.

**Public Members**

uint16_t `bits`
bit mask representation of PASSTHROUGH commands

**Macros**

`ESP_AVRC_TRANS_LABEL_MAX`
max transaction label

**Type Definitions**

typedef void (*`esp_avrc_ct_cb_t`) (**esp_avrc_ct_cb_event_t** event, **esp_avrc_ct_cb_param_t** *param)
AVRCP controller callback function type.

**Parameters**

- **event**: Event type
- **param**: Pointer to callback parameter union

typedef void (*`esp_avrc_tg_cb_t`) (**esp_avrc_tg_cb_event_t** event, **esp_avrc_tg_cb_param_t** *param)
AVRCP target callback function type.

**Parameters**
• **event**: Event type  
• **param**: Pointer to callback parameter union

**Enumerations**

```c
enum esp_avrc_features_t  
# AVRC feature bit mask.

Values:

ESP_AVRC_FEAT_RCTG = 0x0001  
    remote control target

  available players changed
ESP_AVRC_RN_ADDRESSED_PLAYER_CHANGE = 0x0b
  the addressed player changed

2.1. Bluetooth API
**ESP_AVRC_RN_UIDS_CHANGE** = 0x0c
UIDs changed

**ESP_AVRC_RN_VOLUME_CHANGE** = 0x0d
volume changed locally on TG

**ESP_AVRC_RN_MAX_EVT**

```c
enum esp_avrc_rn_evt_cap_t
AVRC target notification event notification capability.
Values:

ESP_AVRC_RN_CAP_ALLOWED_EVT = 0
all of the notification events that can possibly be supported, immutable

ESP_AVRC_RN_CAP_SUPPORTED_EVT = 1
notification events selectively supported according to the current configuration
```

**ESP_AVRC_RN_CAP_MAX**

```c
enum esp_avrc_rn_rsp_t
AVRC notification response type.
Values:

ESP_AVRC_RN_RSP_INTERIM = 13
initial response to RegisterNotification, should be sent T_mtp(1000ms) from receiving the command

ESP_AVRC_RN_RSP_CHANGED = 15
final response to RegisterNotification command
```

**ESP_AVRC_RN_RSP_MAX**

```c
enum esp_avrc_ps_attr_ids_t
AVRC player setting ids.
Values:

ESP_AVRC_PS_EQUALIZER = 0x01
equalizer, on or off

ESP_AVRC_PS_REPEAT_MODE = 0x02
repeat mode

ESP_AVRC_PS_SHUFFLE_MODE = 0x03
shuffle mode

ESP_AVRC_PS_SCAN_MODE = 0x04
scan mode on or off

ESP_AVRC_PS_MAX_ATTR
```

**ESP_AVRC_PS_MAX_ATTR**

```c
enum esp_avrc_ps_eq_value_ids_t
AVRC equalizer modes.
Values:

ESP_AVRC_PS_EQUALIZER_OFF = 0x1
equalizer OFF

ESP_AVRC_PS_EQUALIZER_ON = 0x2
equalizer ON
```

**ESP_AVRC_PS_MAX_ATTR**

```c
enum esp_avrc_ps_rpt_value_ids_t
AVRC repeat modes.
Values:
```
ESP_AVRC_PS_REPEAT_OFF = 0x1
    repeat mode off
ESP_AVRC_PS_REPEAT_SINGLE = 0x2
    single track repeat
ESP_AVRC_PS_REPEAT_GROUP = 0x3
    group repeat

enum esp_avrc_ps_shf_value_ids_t
    AVRC shuffle modes.
    Values:
    ESP_AVRC_PS_SHUFFLE_OFF = 0x1
    ESP_AVRC_PS_SHUFFLE_ALL = 0x2
    ESP_AVRC_PS_SHUFFLE_GROUP = 0x3

enum esp_avrc_ps_scn_value_ids_t
    AVRC scan modes.
    Values:
    ESP_AVRC_PS_SCAN_OFF = 0x1
        scan off
    ESP_AVRC_PS_SCAN_ALL = 0x2
        all tracks scan
    ESP_AVRC_PS_SCAN_GROUP = 0x3
        group scan

enum esp_avrc_rsp_t
    AVCTP response codes.
    Values:
    ESP_AVRC_RSP_NOT_IMPL = 8
        not implemented
    ESP_AVRC_RSP_ACCEPT = 9
        accept
    ESP_AVRC_RSP_REJECT = 10
        reject
    ESP_AVRC_RSP_IN_TRANS = 11
        in transition
    ESP_AVRC_RSP_IMPL_STBL = 12
        implemented/stable
    ESP_AVRC_RSP_CHANGED = 13
        changed
    ESP_AVRC_RSP_INTERIM = 15
        interim

enum esp_avrc_batt_stat_t
    AVRCP battery status.
    Values:
ESP_AVRC_BATT_NORMAL = 0
   normal state
ESP_AVRC_BATT_WARNING = 1
   unable to operate soon
ESP_AVRC_BATT_CRITICAL = 2
   cannot operate any more
ESP_AVRC_BATT_EXTERNAL = 3
   plugged to external power supply
ESP_AVRC_BATT_FULL_CHARGE = 4
   when completely charged from external power supply

enum esp_avrc_playback_stat_t
AVRCP current status of playback.
Values:
ESP_AVRC_PLAYBACK_STOPPED = 0
   stopped
ESP_AVRC_PLAYBACK_PLAYING = 1
   playing
ESP_AVRC_PLAYBACK_PAUSED = 2
   paused
ESP_AVRC_PLAYBACK_FWD_SEEK = 3
   forward seek
ESP_AVRC_PLAYBACK_REV_SEEK = 4
   reverse seek
ESP_AVRC_PLAYBACK_ERROR = 0xFF
   error

SPP API

Overview

Instructions

Application Example

Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is a SPP demo. This demo can discover the service, connect, send and receive SPP data bluetooth/bluedroid/classic_bt/bt_spp_acceptor, bluetooth/bluedroid/classic_bt/bt_spp_initiator

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_spp_api.h
Functions

**esp_err_t esp_spp_register_callback (esp_spp_cb_t callback)**
This function is called to init callbacks with SPP module.

- Return
  - ESP_OK: success
  - other: failed

- **Parameters**
  - callback: pointer to the init callback function.

**esp_err_t esp_spp_init (esp_spp_mode_t mode)**
This function is called to init SPP.

- Return
  - ESP_OK: success
  - other: failed

- **Parameters**
  - mode: Choose the mode of SPP, ESP_SPP_MODE_CB or ESP_SPP_MODE_VFS.

**esp_err_t esp_spp_deinit (void)**
This function is called to uninit SPP.

- Return
  - ESP_OK: success
  - other: failed

**esp_err_t esp_spp_start_discovery (esp_bd_addr_t bd_addr)**
This function is called to performs service discovery for the services provided by the given peer device. When the operation is complete the callback function will be called with ESP_SPP_DISCOVERY_COMP_EVT.

- Return
  - ESP_OK: success
  - other: failed

- **Parameters**
  - bd_addr: Remote device bluetooth device address.

**esp_err_t esp_spp_connect (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t remote_scn, esp_bd_addr_t peer_bd_addr)**
This function makes an SPP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP_SPP_CL_INIT_EVT. When the connection is established or failed, the callback is called with ESP_SPP_OPEN_EVT.

- Return
  - ESP_OK: success
  - other: failed
Parameters

- **sec_mask**: Security Setting Mask. Suggest to use ESP_SPP_SEC_NONE, ESP_SPP_SEC_AUTHORIZE or ESP_SPP_SEC_AUTHENTICATE only.
- **role**: Master or slave.
- **remote_scn**: Remote device Bluetooth device SCN.
- **peer_bd_addr**: Remote device Bluetooth device address.

```c
esp_err_t esp_spp_disconnect (uint32_t handle)
```

This function closes an SPP connection.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- **handle**: The connection handle.

```c
esp_err_t esp_spp_start_srv (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t local_scn, const char *name)
```

This function creates a SPP server and starts listening for an SPP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP_SPP_START_EVT. When the connection is established, the callback is called with ESP_SPP_SRV_OPEN_EVT.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- **sec_mask**: Security Setting Mask. Suggest to use ESP_SPP_SEC_NONE, ESP_SPP_SEC_AUTHORIZE or ESP_SPP_SEC_AUTHENTICATE only.
- **role**: Master or slave.
- **local_scn**: The specific channel you want to get. If channel is 0, means get any channel.
- **name**: Server's name.

```c
esp_err_t esp_spp_write (uint32_t handle, int len, uint8_t *p_data)
```

This function is used to write data, only for ESP_SPP_MODE_CB.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- **handle**: The connection handle.
- **len**: The length of the data written.
- **p_data**: The data written.
esp_err_t esp_spp_vfs_register (void)
This function is used to register VFS.

Return

• ESP_OK: success
• other: failed

Unions

union esp_spp_cb_param_t
#include <esp_spp_api.h> SPP callback parameters union.

Public Members

struct esp_spp_cb_param_t::spp_init_evt_param init
SPP callback param of SPP_INIT_EVT

struct esp_spp_cb_param_t::spp_discovery_comp_evt_param disc_comp
SPP callback param of SPP_DISCOVERY_COMP_EVT

struct esp_spp_cb_param_t::spp_open_evt_param open
SPP callback param of ESP_SPP_OPEN_EVT

struct esp_spp_cb_param_t::spp_srv_open_evt_param srv_open
SPP callback param of ESP_SPP_SRV_OPEN_EVT

struct esp_spp_cb_param_t::spp_close_evt_param close
SPP callback param of ESP_SPP_CLOSE_EVT

struct esp_spp_cb_param_t::spp_start_evt_param start
SPP callback param of ESP_SPP_START_EVT

struct esp_spp_cb_param_t::spp_cl_init_evt_param cl_init
SPP callback param of ESP_SPP_CL_INIT_EVT

struct esp_spp_cb_param_t::spp_write_evt_param write
SPP callback param of ESP_SPP_WRITE_EVT

struct esp_spp_cb_param_t::spp_data_ind_evt_param data_ind
SPP callback param of ESP_SPP_DATA_IND_EVT

struct esp_spp_cb_param_t::spp_cong_evt_param cong
SPP callback param of ESP_SPP_CONG_EVT

struct spp_cl_init_evt_param
#include <esp_spp_api.h> ESP_SPP_CL_INIT_EVT.

Public Members

esp_spp_status_t status
status

2.1. Bluetooth API
Public Members

```c
enum esp_spp_status_t status
uint32_t handle
    The connection handle
uint8_t sec_id
    security ID used by this server
bool use_co
    TRUE to use co_rfc_data
```

```c
struct spp_write_evt_param
    #include <esp_spp_api.h> ESP_SPP_WRITE_EVT.
```

Public Members

```c
enum esp_spp_status_t status
uint32_t handle
    The connection handle
int len
    The length of the data written.
bool cong
    congestion status
```

 Macros

**ESP_SPP_SEC_NONE**
No security. relate to BTA_SEC_NONE in bta/bta_api.h

**ESP_SPP_SEC_AUTHORIZE**
Authorization required (only needed for outgoing connection) relate to BTA_SEC_AUTHORIZE in bta/bta_api.h

**ESP_SPP_SEC_AUTHENTICATE**
Authentication required. relate to BTA_SEC_AUTHENTICATE in bta/bta_api.h

**ESP_SPP_SEC_ENCRYPT**
Encryption required. relate to BTA_SEC_ENCRYPT in bta/bta_api.h

**ESP_SPP_SEC_MODE4_LEVEL4**
Mode 4 level 4 service, i.e. incoming/outgoing MITM and P-256 encryption relate to BTA_SEC_MODE4_LEVEL4 in bta/bta_api.h

**ESP_SPP_SEC_MITM**
Man-In-The-Middle protection relate to BTA_SEC_MITM in bta/bta_api.h

**ESP_SPP_SEC_IN_16_DIGITS**
Min 16 digit for pin code relate to BTA_SEC_IN_16_DIGITS in bta/bta_api.h

**ESP_SPP_MAX_MTU**
SPP max MTU

280 Chapter 2. API Reference

**Type Definitions**

typedef uint16_t esp_spp_sec_t
typedef void() esp_spp_cb_t(esp_spp_cb_event_t event, esp_spp_cb_param_t *param)

SPP callback function type.

Parameters

- event: Event type
- param: Point to callback parameter, currently is union type

**Enumerations**

enum esp_spp_status_t

Values:

- `ESP_SPP_SUCCESS` = 0
  Successful operation.
- `ESP_SPP_FAILURE`  
  Generic failure.
- `ESP_SPP_BUSY`  
  Temporarily can not handle this request.
- `ESP_SPP_NO_DATA`  
  no data.
- `ESP_SPP_NO_RESOURCE`  
  No more set pm control block

enum esp_spp_role_t

Values:

- `ESP_SPP_ROLE_MASTER` = 0  
  Role: master
- `ESP_SPP_ROLE_SLAVE` = 1  
  Role: slave

enum esp_spp_mode_t

Values:

- `ESP_SPP_MODE_CB` = 0  
  When data is coming, a callback will come with data
- `ESP_SPP_MODE_VFS` = 1  
  Use VFS to write/read data

enum esp_spp_cb_event_t

SPP callback function events.

Values:
when SPP is initiated, the event comes

ESP_SPP_DISCOVERY_COMP_EVT = 8
when SDP discovery complete, the event comes

ESP_SPP_OPEN_EVT = 26
when SPP Client connection open, the event comes

ESP_SPP_CLOSE_EVT = 27
when SPP connection closed, the event comes

ESP_SPP_START_EVT = 28
when SPP server started, the event comes

ESP_SPP_CL_INIT_EVT = 29
when SPP client initiated a connection, the event comes

ESP_SPP_DATA_IND_EVT = 30
when SPP connection received data, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_CONG_EVT = 31
when SPP connection congestion status changed, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_WRITE_EVT = 33
when SPP write operation completes, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_SRV_OPEN_EVT = 34
when SPP Server connection open, the event comes

Type Definitions

typedef void (*esp_hf_connection_state_callback)(esp_hf_connection_state_t state, esp_bd_addr_t *bd_addr)
  Callback for connection state change. state will have one of the values from BtHfConnectionState

typedef void (*esp_hf_audio_state_callback)(esp_hf_audio_state_t state, esp_bd_addr_t *bd_addr)
  Callback for audio connection state change. state will have one of the values from BtHfAudioState

typedef void (*esp_hf_vr_cmd_callback)(esp_hf_vr_state_t state, esp_bd_addr_t *bd_addr)
  Callback for VR connection state change. state will have one of the values from BtHfVRState

typedef void (*esp_hf_answer_call_cmd_callback)(esp_bd_addr_t *bd_addr)
  Callback for answering incoming call (ATA)

typedef void (*esp_hf_hangup_call_cmd_callback)(esp_bd_addr_t *bd_addr)
  Callback for disconnect call (AT+CHUP)

typedef void (*esp_hf_volume_cmd_callback)(esp_hf_volume_control_target_t type, int volume, esp_bd_addr_t *bd_addr)
  Callback for disconnect call (AT+CHUP) type will denote Speaker/Mic gain (BtHfVolumeControl).

typedef void (*esp_hf_dial_call_cmd_callback)(char *number, esp_bd_addr_t *bd_addr)
  Callback for dialing an outgoing call If number is NULL, redial

typedef void (*esp_hf_dtmf_cmd_callback)(char tone, esp_bd_addr_t *bd_addr)
  Callback for sending DTMF tones tone contains the dtmf character to be sent

typedef void (*esp_hf_nrec_cmd_callback)(esp_hf_nrec_t nrec, esp_bd_addr_t *bd_addr)
  Callback for enabling/disabling noise reduction/echo cancellation value will be 1 to enable, 0 to disable

typedef void (*esp_hf_wbs_callback)(esp_hf_wbs_config_t wbs, esp_bd_addr_t *bd_addr)
  Callback for AT+BCS and event from BAC WBS enable, WBS disable

typedef void (*esp_hf_chld_cmd_callback)(esp_hf_chld_type_t chld, esp_bd_addr_t *bd_addr)
  Callback for call hold handling (AT+CHLD) value will contain the call hold command (0, 1, 2, 3)

typedef void (*esp_hf_cnum_cmd_callback)(esp_bd_addr_t *bd_addr)
  Callback for CNUM (subscriber number)

typedef void (*esp_hf_cind_cmd_callback)(esp_bd_addr_t *bd_addr)
  Callback for indicators (CIND)

typedef void (*esp_hf_cops_cmd_callback)(esp_bd_addr_t *bd_addr)
  Callback for operator selection (COPS)

typedef void (*esp_hf_clcc_cmd_callback)(esp_bd_addr_t *bd_addr)
  Callback for call list (AT+CLCC)

typedef void (*esp_hf_unknown_at_cmd_callback)(char *at_string, esp_bd_addr_t *bd_addr)
  Callback for unknown AT command recd from AG at_string will contain the unparsed AT string

typedef void (*esp_hf_key_pressed_cmd_callback)(esp_bd_addr_t *bd_addr)
  Callback for keypressed (HSP) event.
Enumerations

enum esp_hf_in_band_ring_state_t
    in-band ring tone state
    
    Values:
    
    ESP_HF_IN_BAND_RINGTONE_NOT_PROVIDED = 0
    ESP_HF_IN_BAND_RINGTONE_PROVIDED

enum esp_hf_vr_state_t
    voice recognition state
    
    Values:
    
    ESP_HF_VR_STATE_DISABLED = 0
        voice recognition disabled
    ESP_HF_VR_STATE_ENABLED
        voice recognition enabled

enum esp_hf_volume_control_target_t
    Bluetooth HFP audio volume control target.
    
    Values:
    
    ESP_HF_VOLUME_CONTROL_TARGET_SPK = 0
        speaker
    ESP_HF_VOLUME_CONTROL_TARGET_MIC
        microphone

enum esp_hf_audio_state_t
    Bluetooth HFP audio connection status.
    
    Values:
    
    ESP_HF_AUDIO_STATE_DISCONNECTED = 0
        audio connection released
    ESP_HF_AUDIO_STATE_CONNECTING
        audio connection has been initiated
    ESP_HF_AUDIO_STATE_CONNECTED
        audio connection is established
    ESP_HF_AUDIO_STATE_CONNECTED_MSBC
        mSBC audio connection is established

enum esp_hf_volume_type_t
    Values:
    
    ESP_HF_VOLUME_TYPE_SPK = 0
    ESP_HF_VOLUME_TYPE_MIC

enum esp_hf_network_state_t
    +CIND network service availability status
    
    Values:
    
    ESP_HF_NETWORK_STATE_NOT_AVAILABLE = 0
    ESP_HF_NETWORK_STATE_AVAILABLE
enum esp_hf_service_type_t
    +CIEV Service type
    
    Values:
    
    ESP_HF_SERVICE_TYPE_HOME = 0
    ESP_HF_SERVICE_TYPE_ROAMING

enum esp_hf_call_status_t
    +CIND call status indicator values
    
    Values:
    
    ESP_HF_CALL_STATUS_NO_CALLS = 0
        no call in progress
    ESP_HF_CALL_STATUS_CALL_IN_PROGRESS = 1
        call is present(active or held)

enum esp_hf_call_setup_status_t
    +CIND call setup status indicator values
    
    Values:
    
    ESP_HF_CALL_SETUP_STATUS_IDLE = 0
        no call setup in progress
    ESP_HF_CALL_SETUP_STATUS_INCOMING = 1
        incoming call setup in progress
    ESP_HF_CALL_SETUP_STATUS_OUTGOING_DIALING = 2
        outgoing call setup in dialing state
    ESP_HF_CALL_SETUP_STATUS_OUTGOING_ALERTING = 3
        outgoing call setup in alerting state

enum esp_hf_roaming_status_t
    +CIND roaming status indicator values
    
    Values:
    
    ESP_HF_ROAMING_STATUS_INACTIVE = 0
        roaming is not active
    ESP_HF_ROAMING_STATUS_ACTIVE
        a roaming is active

enum esp_hf_call_held_status_t
    +CIND call held indicator values
    
    Values:
    
    ESP_HF_CALL_HELD_STATUS_NONE = 0
        no calls held
    ESP_HF_CALL_HELD_STATUS_HELD_AND_ACTIVE = 1
        both active and held call
    ESP_HF_CALL_HELD_STATUS_HELD = 2
        call on hold, no active call

enum esp_hf_current_call_status_t
    +CLCC status of the call
    
    Values:
ESP_HF_CURRENT_CALL_STATUS_ACTIVE = 0
    active
ESP_HF_CURRENT_CALL_STATUS_HELD = 1
    held
ESP_HF_CURRENT_CALL_STATUS_DIALING = 2
    dialing (outgoing calls only)
ESP_HF_CURRENT_CALL_STATUS_ALERTING = 3
    alerting (outgoing calls only)
ESP_HF_CURRENT_CALL_STATUS_INCOMING = 4
    incoming (incoming calls only)
ESP_HF_CURRENT_CALL_STATUS_WAITING = 5
    waiting (incoming calls only)
ESP_HF_CURRENT_CALL_STATUS_HELD_BY_RESP_HOLD = 6
    call held by response and hold

enum esp_hf_current_call_direction_t
    +CLCC direction of the call

    Values:
    ESP_HF_CURRENT_CALL_DIRECTION_OUTGOING = 0
        outgoing
    ESP_HF_CURRENT_CALL_DIRECTION_INCOMING = 1
        incoming

enum esp_hf_current_call_mpty_type_t
    +CLCC multi-party call flag

    Values:
    ESP_HF_CURRENT_CALL_MPTY_TYPE_SINGLE = 0
        not a member of a multi-party call
    ESP_HF_CURRENT_CALL_MPTY_TYPE_MULTI = 1
        member of a multi-party call

    +CLCC address type

    Values:
    ESP_HF_CALL_ADDR_TYPE_UNKNOWN = 0x81
        unknown address type
    ESP_HF_CALL_ADDR_TYPE_INTERNATIONAL = 0x91
        international address
enum esp_hf_subscriber_service_type_t
  +CNUM service type of the phone number

Values:

  ESP_HF_SUBSCRIBER_SERVICE_TYPE_UNKNOWN = 0
      unknown

  ESP_HF_SUBSCRIBER_SERVICE_TYPE_VOICE
      voice service

  ESP_HF_SUBSCRIBER_SERVICE_TYPE_FAX
      fax service

enum esp_hf_btrh_status_t
  +BTRH response and hold result code

Values:

  ESP_HF_BTRH_STATUS_HELD = 0
      incoming call is put on hold in AG

  ESP_HF_BTRH_STATUS_ACCEPTED
      held incoming call is accepted in AG

  ESP_HF_BTRH_STATUS_REJECTED
      held incoming call is rejected in AG

enum esp_hf_btrh_cmd_t
  AT+BTRH response and hold action code.

Values:

  ESP_HF_BTRH_CMD_HOLD = 0
      put the incoming call on hold

  ESP_HF_BTRH_CMD_ACCEPT = 1
      accept a held incoming call

  ESP_HF_BTRH_CMD_REJECT = 2
      reject a held incoming call

enum esp_hf_nrec_t

Values:

  ESP_HF_NREC_STOP = 0

  ESP_HF_NREC_START

enum esp_hf_call_waiting_status_t
  +CCWA response status

Values:

  ESP_HF_CALL_WAITING_INACTIVE

  ESP_HF_CALL_WAITING_ACTIVE

enum esp_hf_wbs_config_t

Values:

  ESP_HF_WBS_NONE

  ESP_HF_WBS_NO

  ESP_HF_WBS_YES
enum esp_hf_connection_state_t
    Bluetooth HFP RFCOMM connection and service level connection status.
    Values:
    ESP_HF_CONNECTION_STATE_DISCONNECTED = 0
        RFCOMM data link channel released
    ESP_HF_CONNECTION_STATE_CONNECTING
        connecting remote device on the RFCOMM data link
    ESP_HF_CONNECTION_STATE_CONNECTED
        RFCOMM connection established
    ESP_HF_CONNECTION_STATE_SLC_CONNECTED
        service level connection established
    ESP_HF_CONNECTION_STATE_DISCONNECTING
        disconnecting with remote device on the RFCOMM data link

enum esp_hf_chld_type_t
    AT+CHLD command values.
    Values:
    ESP_HF_CHLD_TYPE_REL = 0
        <0>, Terminate all held or set UDUB(“busy”) to a waiting call
    ESP_HF_CHLD_TYPE_REL_ACC
        <1>, Terminate all active calls and accepts a waiting/held call
    ESP_HF_CHLD_TYPE_HOLD_ACC
        <2>, Hold all active calls and accepts a waiting/held call
    ESP_HF_CHLD_TYPE_MERGE
        <3>, Add all held calls to a conference
    ESP_HF_CHLD_TYPE_MERGE_DETACH
        <4>, connect the two calls and disconnects the subscriber from both calls
    ESP_HF_CHLD_TYPE_REL_X
        <1x>, releases specified calls only
    ESP_HF_CHLD_TYPE_PRIV_X
        <2x>, request private consultation mode with specified call

enum esp_hf_at_response_code_t
    Values:
    ESP_HF_AT_RESPONSE_CODE_OK = 0
        acknowledges execution of a command line
    ESP_HF_AT_RESPONSE_CODE_ERR
        command not accepted
    ESP_HF_AT_RESPONSE_CODE_NO_CARRIER
        connection terminated
    ESP_HF_AT_RESPONSE_CODE_BUSY
        busy signal detected

    network not allowed emergency calls only

HFP CLIENT API

Overview

Instructions

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_hf_client_api.h

Functions

`esp_err_t esp_hf_client_register_callback (esp_hf_client_cb_t callback)`
    Register application callback function to HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully, used by HFP client.

    Return
    - ESP_OK: success
    - ESP_INVALID_STATE: if bluetooth stack is not yet enabled
    - ESP_FAIL: if callback is a NULL function pointer

    Parameters
    - `callback`: HFP client event callback function

`esp_err_t esp_hf_client_init (void)`
    Initialize the bluetooth HFP client module. This function should be called after esp_bluedroid_enable() completes successfully.
Return

• ESP_OK: if the initialization request is sent successfully
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

`esp_err_t esp_hf_client_deinit (void)`
De-initialize for HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully.

Return

• ESP_OK: success
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

`esp_err_t esp_hf_client_connect (esp_bd_addr_t remote_bda)`
Connect to remote bluetooth HFP audio gateway(AG) device, must after esp_hf_client_init()

Return

• ESP_OK: connect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters

• `remote_bda`: remote bluetooth device address

`esp_err_t esp_hf_client_disconnect (esp_bd_addr_t remote_bda)`
Disconnect from the remote HFP audio gateway.

Return

• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters

• `remote_bda`: remote bluetooth device address

`esp_err_t esp_hf_client_connect_audio (esp_bd_addr_t remote_bda)`
Create audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return

• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• remote_bda: remote bluetooth device address

```
esp_err_t esp_hf_client_disconnect_audio(esp_bd_addr_t remote_bda)
```
Release the established audio connection with remote HFP AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- remote_bda: remote bluetooth device address

```
esp_err_t esp_hf_client_start_voice_recognition(void)
```
Enable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```
esp_err_t esp_hf_client_stop_voice_recognition(void)
```
Disable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```
esp_err_t esp_hf_client_volume_update(esp_hf_volume_control_target_t type, int volume)
```
Volume synchronization with AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- type: volume control target, speaker or microphone
- volume: gain of the speaker of microphone, ranges 0 to 15

```
esp_err_t esp_hf_client_dial(const char *number)
```
Place a call with a specified number, if number is NULL, last called number is called. As a precondition to use this API, Service Level Connection shall exist with AG.
Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- number: number string of the call. If NULL, the last number is called (aka re-dial)

`esp_err_t esp_hf_client_dial_memory(int location)`
Place a call with number specified by location (speed dial). As a precondition, to use this API, Service Level Connection shall exist with AG.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- location: location of the number in the memory

`esp_err_t esp_hf_client_send_chld_cmd(esp_hf_chld_type_t chld, int idx)`
Send call hold and multiparty commands, or enhanced call control commands (Use AT+CHLD). As a precondition to use this API, Service Level Connection shall exist with AG.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- chld: AT+CHLD call hold and multiparty handling AT command.
- idx: used in Enhanced Call Control Mechanisms, used if chld is ESP_HF_CHLD_TYPE_REL_X or ESP_HF_CHLD_TYPE_PRIV_X

`esp_err_t esp_hf_client_send_btrh_cmd(esp_hf_btrh_cmd_t btrh)`
Send response and hold action command (Send AT+BTRH command) As a precondition to use this API, Service Level Connection shall exist with AG.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- btrh: response and hold action to send
esp_err_t esp_hf_client_answer_call (void)

Answer an incoming call (send ATA command). As a precondition to use this API, Service Level Connection shall exist with AG.

Return

• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_client_reject_call (void)

Reject an incoming call (send AT+CHUP command), As a precondition to use this API, Service Level Connection shall exist with AG.

Return

• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_client_query_current_calls (void)

Query list of current calls in AG (send AT+CLCC command), As a precondition to use this API, Service Level Connection shall exist with AG.

Return

• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_client_query_current_operator_name (void)

Query the name of currently selected network operator in AG (use AT+COPS commands) As a precondition to use this API, Service Level Connection shall exist with AG.

Return

• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_client_retrieve_subscriber_info (void)

Get subscriber information number from AG (send AT+CNUM command) As a precondition to use this API, Service Level Connection shall exist with AG.

Return

• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others
esp_err_t esp_hf_client_send_dtmf(char code)
Transmit DTMF codes during an ongoing call (use AT+VTS commands) As a precondition to use this API, Service Level Connection shall exist with AG.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• code: dtmf code, single ascii character in the set 0-9, #, *, A-D

esp_err_t esp_hf_client_request_last_voice_tag_number (void)
Request a phone number from AG corresponding to last voice tag recorded (send AT+BINP command). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_client_send_nrec (void)
Disable echo cancellation and noise reduction in the AG (use AT+NREC=0 command) As a precondition to use this API, Service Level Connection shall exist with AG.

Return
• ESP_OK: NREC=0 request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_hf_client_register_data_callback (esp_hf_client_incoming_data_cb_t recv, esp_hf_client_outgoing_data_cb_t send)
Register HFP client data output function; the callback is only used in the case that Voice Over HCI is enabled.

Return
• ESP_OK: success
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: if callback is a NULL function pointer

Parameters
• recv: HFP client incoming data callback function
• send: HFP client outgoing data callback function

void esp_hf_client_outgoing_data_ready (void)
Trigger the lower-layer to fetch and send audio data. This function is only only used in the case that Voice Over HCI is enabled. Precondition is that the HFP audio connection is connected. After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data.

2.1. Bluetooth API 295
void `esp_hf_client_pcm_resample_init` (uint32_t src_sps, uint32_t bits, uint32_t channels)

Initialize the down sampling converter. This is a utility function that can only be used in the case that Voice Over HCI is enabled.

**Parameters**

- `src_sps`: original samples per second (source audio data, i.e. 48000, 32000, 16000, 44100, 22050, 11025)
- `bits`: number of bits per pcm sample (16)
- `channels`: number of channels (i.e. mono(1), stereo(2)…)

void `esp_hf_client_pcm_resample_deinit` (void)

Deinitialize the down sampling converter.

int32_t `esp_hf_client_pcm_resample` (void *src, uint32_t in_bytes, void *dst)

Down sampling utility to convert high sampling rate into 8K/16bits 1-channel mode PCM samples. This can only be used in the case that Voice Over HCI is enabled.

**Return** number of samples converted

**Parameters**

- `src`: pointer to the buffer where the original sampling PCM are stored
- `in_bytes`: length of the input PCM sample buffer in byte
- `dst`: pointer to the buffer which is to be used to store the converted PCM samples

**Unions**

union `esp_hf_client_cb_param_t`

#include `<esp_hf_client_api.h>` HFP client callback parameters.

**Public Members**

Type Definitions

typedef void (*esp_hf_client_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)
HFP client incoming data callback function, the callback is useful in case of Voice Over HCI.
Parameters

- buf: pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- len: size (in bytes) in buf

```c
typedef uint32_t (*esp_hf_client_outgoing_data_cb_t)(uint8_t *buf, uint32_t len)
```

HFP client outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

Parameters

- buf: pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- len: size (in bytes) in buf
- length: of data successfully read

```c
typedef void (*esp_hf_client_cb_t)(esp_hf_client_cb_event_t event, esp_hf_client_cb_param_t *param)
```

HFP client callback function type.

Parameters

- event: Event type
- param: Pointer to callback parameter

Enumerations

```
enum esp_hf_client_connection_state_t

Bluetooth HFP RFCOMM connection and service level connection status.

Values:

ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTED = 0
RFCOMM data link channel released

ESP_HF_CLIENT_CONNECTION_STATE_CONNECTING
connecting remote device on the RFCOMM data link

ESP_HF_CLIENT_CONNECTION_STATE_CONNECTED
RFCOMM connection established

ESP_HF_CLIENT_CONNECTION_STATE_SLC_CONNECTED
service level connection established

ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTING
disconnecting with remote device on the RFCOMM data link
```

```
enum esp_hf_client_audio_state_t

Bluetooth HFP audio connection status.

Values:

ESP_HF_CLIENT_AUDIO_STATE_DISCONNECTED = 0
audio connection released
```
ESP_HF_CLIENT_AUDIO_STATE_CONNECTING
audio connection has been initiated

ESP_HF_CLIENT_AUDIO_STATE_CONNECTED
audio connection is established

ESP_HF_CLIENT_AUDIO_STATE_CONNECTED_MSBC
mSBC audio connection is established

enum esp_hf_client_in_band_ring_state_t
in-band ring tone state

Values:

ESP_HF_CLIENT_IN_BAND_RINGTONE_NOT_PROVIDED = 0

ESP_HF_CLIENT_IN_BAND_RINGTONE_PROVIDED

definitions

enum esp_hf_client_cb_event_t
HF CLIENT callback events.

Values:

ESP_HF_CLIENT_CONNECTION_STATE_EVT = 0
connection state changed event

ESP_HF_CLIENT_AUDIO_STATE_EVT
audio connection state change event

ESP_HF_CLIENT_BVRA_EVT
voice recognition state change event

ESP_HF_CLIENT_CIND_CALL_EVT
call indication

ESP_HF_CLIENT_CIND_CALL_SETUP_EVT
call setup indication

ESP_HF_CLIENT_CIND_CALL_HELD_EVT
call held indication

ESP_HF_CLIENT_CIND_SERVICE_AVAILABILITY_EVT
network service availability indication

ESP_HF_CLIENT_CIND_SIGNAL_STRENGTH_EVT
signal strength indication

ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT
roaming status indication

ESP_HF_CLIENT_CIND_BATTERY_LEVEL_EVT
battery level indication

ESP_HF_CLIENT_COPS_CURRENT_OPERATOR_EVT
current operator information

ESP_HF_CLIENT_BTRH_EVT
call response and hold event

ESP_HF_CLIENT_CLIP_EVT
Calling Line Identification notification

ESP_HF_CLIENT_CCWA_EVT
call waiting notification
ESP_HF_CLIENT_CLCC_EVT
list of current calls notification

ESP_HF_CLIENT_VOLUME_CONTROL_EVT
audio volume control command from AG, provided by +VGM or +VGS message

ESP_HF_CLIENT_AT_RESPONSE_EVT
AT command response event

ESP_HF_CLIENT_CNUM_EVT
subscriber information response from AG

ESP_HF_CLIENT_BSIR_EVT
setting of in-band ring tone

ESP_HF_CLIENT_BINP_EVT
requested number of last voice tag from AG

ESP_HF_CLIENT_RING_IND_EVT
ring indication event

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_hf_ag_api.h

Functions

esp_err_t esp_bt_hf_register_callback (esp_hf_cb_t callback)
Register application callback function to HFP AG module. This function should be called only after esp_bluedroid_enable() completes successfully, used by HFP AG.

Return

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters

- callback: HFP AG event callback function

esp_err_t esp_bt_hf_init (esp_bd_addr_t remote_addr)
Initialize the bluetooth HF AG module. This function should be called after esp_bluedroid_enable() completes successfully.

Return
• ESP_OK: if the initialization request is sent successfully
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

**Parameters**

- `remote_addr`: remote bluetooth device address

`esp_err_t esp_bt_hf_deinit (esp_bd_addr_t remote_addr)`

De-initialize for HF AG module. This function should be called only after esp_bluedroid_enable() completes successfully.

**Return**

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- `remote_addr`: remote bluetooth device address

`esp_err_t esp_bt_hf_connect (esp_bd_addr_t remote_bda)`

Connect to remote bluetooth HFP client device, must after esp_bt_hf_init()

**Return**

- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- `remote_bda`: remote bluetooth HFP client device address

`esp_err_t esp_bt_hf_disconnect (esp_bd_addr_t remote_bda)`

Disconnect from the remote HFP client.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- `remote_bda`: remote bluetooth device address

`esp_err_t esp_bt_hf_connect_audio (esp_bd_addr_t remote_bda)`

Create audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist between HF client and AG.

**Return**

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- remote_bda: remote bluetooth device address

```c
esp_err_t esp_bt_hf_disconnect_audio(esp_bd_addr_t remote_bda)
```
Release the established audio connection with remote HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- remote_bda: remote bluetooth device address

```c
esp_err_t esp_bt_hf_vra(esp_bd_addr_t remote_bda, esp_hf_vr_state_t value)
```
Response of Volume Recognition Command(AT+VRA) from HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- remote_bda: volume control target, speaker or microphone
- value: gain of the speaker of microphone, ranges 0 to 15

```c
esp_err_t esp_bt_hf_volume_control(esp_bd_addr_t remote_bda, esp_hf_volume_control_target_t type, int volume)
```
Volume synchronization with HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- remote_bda: remote bluetooth device address
- type: volume control target, speaker or microphone
- volume: gain of the speaker of microphone, ranges 0 to 15

```c
esp_err_t esp_hf_unat_response(esp_bd_addr_t remote_addr, char *unat)
```
Handle Unknown AT command from HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.
Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- remote_addr: remote bluetooth device address
- unat: User AT command response to HF Client. It will response “ERROR” by default if unat is NULL.

```c
esp_err_t esp_bt_hf_cmee_response(esp_bd_addr_t remote_bda, esp_hf_at_response_code_t response_code, esp_hf_cme_err_t error_code)
```

Unsolicited send extend AT error code to HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- remote_bda: remote bluetooth device address
- response_code: AT command response code
- error_code: CME error code

```c
esp_err_t esp_bt_hf_indchange_notification(esp_bd_addr_t remote_addr, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, esp_hf_network_state_t ntk_state, int signal)
```

Unsolicited send device status notificaiton to HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- remote_addr: remote bluetooth device address
- call_state: call state
- call_setup_state: call setup state
- ntk_state: network service state
- signal: signal strength from 0 to 5

2.1. Bluetooth API
esp_err_t esp_bt_hf_cind_response(esp_bd_addr_t remote_addr, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, esp_hf_network_state_t ntk_state, int signal, esp_hf_roaming_status_t roam, int batt_lev, esp_hf_call_held_status_t call_held_status)

Response to device individual indicators to HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- remote_addr: remote bluetooth device address
- call_state: call state
- call_setup_state: call setup state
- ntk_state: network service state
- signal: signal strength from 0 to 5
- roam: roam state
- batt_lev: battery level from 0 to 5
- call_held_status: call held status

esp_err_t esp_bt_hf_cops_response(esp_bd_addr_t remote_addr, char *name)

Response for AT+COPS command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP Client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- remote_addr: remote bluetooth device address
- name: current operator name

esp_err_t esp_bt_hf_clcc_response(esp_bd_addr_t remote_addr, int index, esp_hf_current_call_direction_t dir, esp_hf_current_call_status_t current_call_state, esp_hf_current_call_mode_t mode, esp_hf_current_call_mpty_type_t mpty, char *number, esp_hf_call_addr_type_t type)

Response to AT+CLCC command from HFP Client. As a precondition to use this API, Service Level Connection shall exist between AG and HF Client.

Return
- ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• remote_addr: remote bluetooth device address
• index: the index of current call
• dir: call direction (incoming/outgoing)
• current_call_state: current call state
• mode: current call mode (voice/data/fax)
• mpty: single or multi type
• number: current call number
• type: international type or unknow

`esp_err_t esp_bt_hf_cnum_response(esp_bd_addr_t remote_addr, char *number, esp_hf_subscriber_service_type_t type)`
Response for AT+CNUM command from HF Client. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• remote_addr: remote bluetooth device address
• number: registration number
• type: service type (unknown/voice/fax)

`esp_err_t esp_bt_hf_bsir(esp_bd_addr_t remote_addr, esp_hf_in_band_ring_state_t state)`
Inform HF Client that AG Provided in-band ring tone or not. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• remote_addr: remote bluetooth device address
• state: in-band ring tone state

2.1. Bluetooth API
Answer Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- remote_addr: remote bluetooth device address
- num_active: the number of active call
- num_held: the number of held call
- call_state: call state
- call_setup_state: call setup state
- number: number of the incoming call
- call_addr_type: call address type

Reject Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- remote_addr: remote bluetooth device address
- num_active: the number of active call
- num_held: the number of held call
- call_state: call state
- call_setup_state: call setup state
- number: number of the incoming call
- call_addr_type: call address type
esp_err_t esp_bt_hf_out_call(esp_bd_addr_t remote_addr, int num_active, int num_held, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, char *number, esp_hf_call_addr_type_t call_addr_type)

Reject incoming call from AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return

• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters

• remote_addr: remote bluetooth device address
• num_active: the number of active call
• num_held: the number of held call
• call_state: call state
• call_setup_state: call setup state
• number: number of the outgoing call
• call_addr_type: call address type

esp_err_t esp_bt_hf_end_call(esp_bd_addr_t remote_addr, int num_active, int num_held, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, char *number, esp_hf_call_addr_type_t call_addr_type)

End an ongoing call. As a precondition to use this API, Service Level Connection shall exist with AG.

Return

• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters

• remote_addr: remote bluetooth device address
• num_active: the number of active call
• num_held: the number of held call
• call_state: call state
• call_setup_state: call setup state
• number: number of the call
• call_addr_type: call address type

esp_err_t esp_bt_hf_register_data_callback(esp_hf_incoming_data_cb_t recv, esp_hf_outgoing_data_cb_t send)

Register AG data output function; the callback is only used in the case that Voice Over HCI is enabled.

Return

2.1. Bluetooth API
• ESP_OK: success
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: if callback is a NULL function pointer

Parameters

• recv: HFP client incoming data callback function
• send: HFP client outgoing data callback function

void esp_hf_outgoing_data_ready (void)
Trigger the lower-layer to fetch and send audio data. This function is only only used in the case that Voice Over HCI is enabled. Precondition is that the HFP audio connection is connected. After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data.

Unions

union esp_hf_cb_param_t
#include <esp_hf_ag_api.h> HFP AG callback parameters.

Public Members

struct esp_hf_cb_param_t::hf_conn_stat_param conn_stat
AG callback param of ESP_HF_CONNECTION_STATE_EVT

struct esp_hf_cb_param_t::hf_audio_stat_param audio_stat
AG callback param of ESP_HF_AUDIO_STATE_EVT

struct esp_hf_cb_param_t::hf_vra_rep_param vra_rep
AG callback param of ESP_HF_BVRA_RESPONSE_EVT

struct esp_hf_cb_param_t::hf_volume_control_param volume_control
AG callback param of ESP_HF_VOLUME_CONTROL_EVT

struct esp_hf_cb_param_t::hf_unat_rep_param unat_rep
AG callback param of ESP_HF_UNAT_RESPONSE_EVT

struct esp_hf_cb_param_t::hf_cind_param cind
AG callback param of ESP_HF_CIND_RESPONSE_EVT

struct esp_hf_cb_param_t::hf_out_call_param out_call
AG callback param of ESP_HF_DIAL_EVT

struct esp_hf_cb_param_t::hf_vts_rep_param vts_rep
AG callback param of ESP_HF_VTS_RESPONSE_EVT

struct esp_hf_cb_param_t::hf_nrec_rep_param nrec
AG callback param of ESP_HF_NREC_RESPONSE_EVT

struct esp_hf_cb_param_t::hf_wbs_rep_param wbs_rep
AG callback param of ESP_HF_WBS_RESPONSE_EVT

struct esp_hf_cb_param_t::hf_bcs_rep_param bcs_rep
AG callback param of ESP_HF_BCS_RESPONSE_EVT

struct hf_audio_stat_param
#include <esp_hf_ag_api.h> ESP_HF_AUDIO_STATE_EVT.
Public Members

\texttt{esp_bd_addr_t \_remote\_addr}
remote bluetooth device address

\texttt{esp_hf_audio_state_t \_state}
audio connection state

\texttt{struct hf\_bcs\_rep\_param}

#include <esp_hf_ag_api.h> ESP\_HF\_BCS\_RESPONSE\_EVT.

Public Members

\texttt{esp_hf_wbs_config_t \_mode}
codec mode CVSD or mSBC

#include <esp_hf_ag_api.h> ESP\_HF\_CIND\_RESPONSE\_EVT.

Public Members

\texttt{esp_hf_call_status_t \_call\_status}
call status indicator

\texttt{esp_hf_call_setup_status_t \_call\_setup\_status}
call setup status indicator

\texttt{esp_hf_network_state_t \_svc}
bluetooth proprietary call hold status indicator

\texttt{int signal\_strength}
bluetooth proprietary call hold status indicator

\texttt{esp_hf_roaming_status_t \_roam}
bluetooth proprietary call hold status indicator

\texttt{int battery\_level}
battery charge value, ranges from 0 to 5

\texttt{esp_hf_call_held_status_t \_call\_held\_status}
bluetooth proprietary call hold status indicator

\texttt{struct hf\_conn\_stat\_param}

#include <esp_hf_ag_api.h> ESP\_HS\_CONNECTION\_STATE\_EVT.

Public Members

\texttt{esp_bd_addr_t \_remote\_bda}
remote bluetooth device address

\texttt{esp_hf_connection_state_t \_state}
Connection state

\texttt{uint32_t \_peer\_feat}
HF supported features

\texttt{uint32_t \_chld\_feat}
AG supported features on call hold and multiparty services
struct hf_nrec_param
#include <esp_hf_ag_api.h> ESP_HF_NREC_RESPONSE_EVT.

Public Members

  esp_hf_nrec_t state
    NREC enabled or disabled

struct hf_out_call_param
#include <esp_hf_ag_api.h> ESP_HF_DIAL_EVT.

Public Members

  esp_bd_addr_t remote_addr
    remote bluetooth device address
  char *num_or_loc
    location in phone memory

struct hf_unat_rep_param
#include <esp_hf_ag_api.h> ESP_HF_UNAT_RESPONSE_EVT.

Public Members

  char *unat
    unknown AT command string

struct hf_volume_control_param
#include <esp_hf_ag_api.h> ESP_HF_VOLUME_CONTROL_EVT.

Public Members

  esp_hf_volume_type_t type
    volume control target, speaker or microphone
  int volume
    gain, ranges from 0 to 15

struct hf_vra_rep_param
#include <esp_hf_ag_api.h> ESP_HF_BVRA_RESPONSE_EVT.

Public Members

  esp_bd_addr_t remote_addr
    remote bluetooth device address
  esp_hf_vr_state_t value
    voice recognition state

struct hf_vts_rep_param
#include <esp_hf_ag_api.h> ESP_HF_VTS_RESPONSE_EVT.
Public Members

char *code  
MTF code from HF Client

struct hf_wbs_rep_param
#include <esp_hf_ag_api.h> ESP_HF_WBS_RESPONSE_EVT.

Public Members

ESP_HF_CHLD_FEAT_MERGE
ESP_HF_CHLD_FEAT_MERGE_DETACH

Type Definitions

typedef void (*esp_hf_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)
AG incoming data callback function, the callback is useful in case of Voice Over HCI.

Parameters

• buf: pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
• len: size(in bytes) in buf
typedef uint32_t (*esp_hf_outgoing_data_cb_t)(uint8_t *buf, uint32_t len)
AG outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

Parameters
- **buf**: pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- **len**: size(in bytes) in buf
- **length**: of data successfully read

typedef void (*esp_hf_cb_t)(esp_hf_cb_event_t event, esp_hf_cb_param_t *param)
HF AG callback function type.

Parameters
- **event**: Event type
- **param**: Pointer to callback parameter

Enumerations

eenum esp_hf_cb_event_t
HF callback events.

Values:

ESP_HF_CONNECTION_STATE_EVT = 0
Connection state changed event

ESP_HF_AUDIO_STATE_EVT
Audio connection state change event

ESP_HF_BVRA_RESPONSE_EVT
Voice recognition state change event

ESP_HF_VOLUME_CONTROL_EVT
Audio volume control command from HF Client, provided by +VGM or +VGS message

ESP_HF_UNAT_RESPONSE_EVT
Unknown AT cmd Response

ESP_HF_IND_UPDATE_EVT
Indicator Update Event

ESP_HF_CIND_RESPONSE_EVT
Call And Device Indicator Response

ESP_HF_COPS_RESPONSE_EVT
Current operator information

ESP_HF_CLCC_RESPONSE_EVT
List of current calls notification

ESP_HF_CNUM_RESPONSE_EVT
Subscriber information response from HF Client
ESP_HF_VTS_RESPONSE_EVT
Enable or not DTMF

ESP_HF_NREC_RESPONSE_EVT
Enable or not NREC

ESP_HF_ATA_RESPONSE_EVT
Answer an Incoming Call

ESP_HF_CHUP_RESPONSE_EVT
Reject an Incoming Call

ESP_HF_DIAL_EVT
Origin an outgoing call with specific number or the dial the last number

ESP_HF_WBS_RESPONSE_EVT
Codec Status

ESP_HF_BCS_RESPONSE_EVT
Final Codec Choice

2.1.5 NimBLE-based host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to NimBLE user guide for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

<table>

<tr>
<td>ESP-NimBLE VHCI Layer</td>
</tr>
<tr>
<td>ESP-Controller</td>
</tr>
</tbody>
</table>

Fig. 1: ESP NimBLE Stack
**Threading Model**

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

**Programming Sequence**

To begin with, make sure that the NimBLE stack is enabled from menuconfig `choose NimBLE for the Bluetooth host`.

Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
- Initialize the host stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to NimBLE tutorial for more details on the programming sequence/NimBLE APIs for different scenarios.

**API Reference**

**Header File**

- `bt/host/nimble/esp-hci/include/esp_nimble_hci.h`

**Functions**

`esp_err_t esp_nimble_hci_init (void)`

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

**Return**

- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

`esp_err_t esp_nimble_hci_and_controller_init (void)`

Initialize ESP Bluetooth controller(link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes ESP controller in BLE only mode and the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.
Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:

```c
void ble_host_task(void *param)
{
    nimble_port_run(); //This function will return only when nimble_port_stop() is executed.
    nimble_port_freertos_deinit();
}

int ret = esp_nimble_hci_and_controller_init();
if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_init() failed with error: %d", ret);
    return;
}

nimble_port_init();

//Initialize the NimBLE Host configuration
nimble_port_freertos_init(ble_host_task);
```

nimble_port_freertos_init() is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to nimble_port_run(). If a separate task is not required, calling nimble_port_run() will run the NimBLE host in the current task.

**Return**

- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

`esp_err_t esp_nimble_hci_deinit(void)`
Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

**Note** This function should be called after the NimBLE host is deinitialized.

**Return**

- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

`esp_err_t esp_nimble_hci_and_controller_deinit(void)`
Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable and deinitialize the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

**Note** This function should not be executed in the context of Bluetooth host task.

**Note** This function should be called after the NimBLE host is deinitialized.

```c
int ret = nimble_port_stop();
if (ret == 0) {
    nimble_port_deinit();

    ret = esp_nimble_hci_and_controller_deinit();
    if (ret != ESP_OK) {
        ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with error: %d", ret);
    }
}
```
If `nimble_port_freertos_init()` is used during initialization, then `nimble_port_freertos_deinit()` should be called in the host task after `nimble_port_run()`.

**Return**

- ESP_OK if the deinitialization is successful
- Appropriate error codes from `esp_err_t` in case of an error

**Macros**

- `BLE_HCI_UART_H4_NONE`
- `BLE_HCI_UART_H4_CMD`
- `BLE_HCI_UART_H4_ACL`
- `BLE_HCI_UART_H4_SCO`
- `BLE_HCI_UART_H4_EVT`

### 2.1.6 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section *Getting Started with ESP-BLE-MESH*. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section *ESP-BLE-MESH Architecture*.

**Application Examples and Demos**

Please refer to Sections *ESP-BLE-MESH Examples* and *ESP-BLE-MESH Demo Videos*.

**API Reference**

ESP-BLE-MESH APIs are divided into the following parts:

- *ESP-BLE-MESH Definitions*
- *ESP-BLE-MESH Core API Reference*
- *ESP-BLE-MESH Models API Reference*
ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

- bt/esp_ble_mesh/api/esp_ble_mesh_defs.h

Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_fast_prov_info_comp_param
set_fast_prov_info_comp
Event parameter of ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_fast_prov_action_comp_param
set_fast_prov_action_comp
Event parameter of ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_heartbeat_msg_recv_param
heartbeat_msg_recv
Event parameter of ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_enable_comp_param
lpn_enable_comp
Event parameter of ESP_BLE_MESH_LPN_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_disable_comp_param
lpn_disable_comp
Event parameter of ESP_BLE_MESH_LPN_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_poll_comp_param
lpn_poll_comp
Event parameter of ESP_BLE_MESH_LPN_POLL_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_friendship_establish_param
lpn_friendship_establish
Event parameter of ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_friendship_terminate_param
lpn_friendship_terminate
Event parameter of ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT
Public Members

int err_code
   Indicate the result of BLE Mesh deinitialization

struct ble_mesh_friend_friendship_establish_param
   #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT.

Public Members

uint16_t lpn_addr
   Low Power Node unicast address

struct ble_mesh_friend_friendship_terminate_param
   #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.
Public Types

enum [anonymous]
This enum value is the reason of friendship termination on the friend node side

Values:

- `ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL`
  Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

- `ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT`
  Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

- `ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ`
  Receive Friend Request from existing Low Power Node

- `ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR`
  Receive Friend Clear from other friend node

- `ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE`
  Friend feature disabled or corresponding NetKey is deleted

Public Members

uint16_t `lpn_addr`
Low Power Node unicast address

`esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param::[anonymous] reason`
This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

struct `ble_mesh_heartbeat_msg_recv_param`
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT.

Public Members

uint8_t `hops`
Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t `feature`
Bit field of currently active features of the node

struct `ble_mesh_input_evt_param`
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_INPUT_EVT.

Public Members

`esp_ble_mesh_input_action_t action`
Action of Input OOB Authentication

uint8_t `size`
Size of Input OOB Authentication

struct `ble_mesh_input_number_comp_param`
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_INPUT_NUM_COMP_EVT.

2.1. Bluetooth API
Public Members

**Public Members**

int **err_code**
Indicate the result of setting unicast address of primary element by the Provisioner

```c
struct ble_mesh_provisioner_set_prov_data_info_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT.
```

**Public Members**

int **err_code**
Indicate the result of setting provisioning info by the Provisioner

```c
struct ble_mesh_provisioner_set_static_oob_val_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT.
```

**Public Members**

int **err_code**
Indicate the result of setting static oob value by the Provisioner

```c
struct ble_mesh_provisioner_store_node_comp_data_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT.
```

2.1. Bluetooth API
Public Members

```c
int err_code
   Indicate the result of storing node composition data by the Provisioner
```

```c
uint16_t addr
   Node element address
```

```c
struct ble_mesh_provisioner_update_local_app_key_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT.
```

```c
Public Members

int err_code
   Indicate the result of updating local AppKey by the Provisioner
```

```c
uint16_t net_idx
   NetKey Index
```

```c
uint16_t app_idx
   AppKey Index
```

```c
struct ble_mesh_provisioner_update_local_net_key_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT.
```

```c
Public Members

int err_code
   Indicate the result of updating local NetKey by the Provisioner
```

```c
uint16_t net_idx
   NetKey Index
```

```c
struct ble_mesh_proxy_client_add_filter_addr_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT.
```

```c
Public Members

int err_code
   Indicate the result of Proxy Client add filter address
```

```c
uint8_t conn_handle
   Proxy connection handle
```

```c
uint16_t net_idx
   Corresponding NetKey Index
```

```c
struct ble_mesh_proxy_client_connect_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT.
```

```c
Public Members

int err_code
   Indicate the result of Proxy Client connect
```
```c
struct ble_mesh_proxy_client_connected_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT.

Public Members

esp_ble_mesh_bd_addr_t addr
    Device address of the Proxy Server

esp_ble_mesh_addr_type_t addr_type
    Device address type

uint16_t net_idx
    Corresponding NetKey Index
```

```c
struct ble_mesh_proxy_client_disconnect_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT.

Public Members

int err_code
    Indicate the result of Proxy Client disconnect

uint8_t conn_handle
    Proxy connection handle

uint8_t reason
    Proxy disconnect reason
```

```c
struct ble_mesh_proxy_client_disconnected_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT.

Public Members

esp_ble_mesh_bd_addr_t addr
    Device address of the Proxy Server

esp_ble_mesh_addr_type_t addr_type
    Device address type

uint8_t conn_handle
    Proxy connection handle

uint16_t net_idx
    Corresponding NetKey Index
```
**struct ble_mesh_proxy_client_recv_adv_pkt_param**

```c
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT.
```

Indicate the result of enabling Mesh Proxy advertising

```
struct ble_mesh_set_fast_prov_action_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT.
```

Public Members

uint8_t **status_action**
Indicate the result of setting action of fast provisioning

```
struct ble_mesh_set_fast_prov_info_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT.
```

Public Members

uint8_t **status_unicast**
Indicate the result of setting unicast address range of fast provisioning

uint8_t **status_net_idx**
Indicate the result of setting NetKey Index of fast provisioning

2.1. Bluetooth API
uint8_t status_match
    Indicate the result of setting matching Device UUID of fast provisioning

struct ble_mesh_set_oob_pub_key_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT.

Public Members

int err_code
    Indicate the result of setting OOB Public Key

struct ble_mesh_set_unprov_dev_name_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT.

Public Members

int err_code
    Indicate the result of setting BLE Mesh device name

struct ble_mesh_start_ble_advertising_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_START_BLE_ADVERTISING_COMP_EVT.

Public Members

int err_code
    Indicate the result of starting BLE advertising

uint8_t index
    Index of the BLE advertising

struct ble_mesh_stop_ble_advertising_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_STOP_BLE_ADVERTISING_COMP_EVT.

Public Members

int err_code
    Indicate the result of stopping BLE advertising

uint8_t index
    Index of the BLE advertising

union esp_ble_mesh_server_state_value_t
#include <esp_ble_mesh_defs.h> Server model state value union.

Public Members

uint8_t onoff
    The value of the Generic OnOff state
    The value of the Light LC Light OnOff state

struct esp_ble_mesh_server_state_value_t::[anonymous] gen_onoff
    The Generic OnOff state
int16_t level
    The value of the Generic Level state

struct esp_ble_mesh_server_state_value_t::[anonymous] gen_level
    The Generic Level state

tuint8_t onpowerup
    The value of the Generic OnPowerUp state

struct esp_ble_mesh_server_state_value_t::[anonymous] gen_onpowerup
    The Generic OnPowerUp state

tuint16_t power
    The value of the Generic Power Actual state

struct esp_ble_mesh_server_state_value_t::[anonymous] gen_power_actual
    The Generic Power Actual state

tuint16_t lightness
    The value of the Light Lightness Actual state
    The value of the Light Lightness Linear state
    The value of the Light CTL Lightness state
    The value of the Light HSL Lightness state
    The value of the Light xyL Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lightness_actual
    The Light Lightness Actual state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lightness_linear
    The Light Lightness Linear state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_ctl_lightness
    The Light CTL Lightness state

tuint16_t temperature
    The value of the Light CTL Temperature state

tint16_t delta_uv
    The value of the Light CTL Delta UV state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_ctl_temp_delta_uv
    The Light CTL Temperature & Delta UV states

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_lightness
    The Light HSL Lightness state

tuint16_t hue
    The value of the Light HSL Hue state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_hue
    The Light HSL Hue state

tuint16_t saturation
    The value of the Light HSL Saturation state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_saturation
    The Light HSL Saturation state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_xyl_lightness
    The Light xyL Lightness state

2.1. Bluetooth API
struct esp_ble_mesh_server_state_value_t::[anonymous] light_lc_light_onoff

The Light LC Light OnOff state

union esp_ble_mesh_model_cb_param_t

#include <esp_ble_mesh_defs.h> BLE Mesh model callback parameters union.

Public Members

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_operation_evt_param

model_operation

Event parameter of ESP_BLE_MESH_MODEL_OPERATION_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_send_comp_param

model_send_comp

Event parameter of ESP_BLE_MESH_MODEL_SEND_COMP_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_comp_param

model_publish_comp

Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_mod_recv_publish_msg_param

client_recv_publish_msg

Event parameter of ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_client_model_send_timeout_param

client_send_timeout

Event parameter of ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_update_evt_param

model_publish_update

Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_server_model_update_state_comp_param

server_model_update_state

Event parameter of ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT

struct ble_mesh_client_model_send_timeout_param

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT.

Public Members

uint32_t opcode

Opcode of the previously sent message

esp_ble_mesh_model_t *model

Pointer to the model which sends the previous message

esp_ble_mesh_msg_ctx_t *ctx

Pointer to the context of the previous message

struct ble_mesh_mod_recv_publish_msg_param

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT.

Public Members

uint32_t opcode

Opcode of the unsolicited received message

esp_ble_mesh_model_t *model

Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t *ctx

Pointer to the context of the message
```c
uint16_t length
    Length of the received message

uint8_t *msg
    Value of the received message

struct ble_mesh_model_operation_evt_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_OPERATION_EVT.

Public Members

uint32_t opcode
    Opcode of the received message

esp_ble_mesh_model_t *model
    Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t *ctx
    Pointer to the context of the received message

uint16_t length
    Length of the received message

uint8_t *msg
    Value of the received message

struct ble_mesh_model_publish_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.

Public Members

int err_code
    Indicate the result of publishing a message

esp_ble_mesh_model_t *model
    Pointer to the model which publishes the message

struct ble_mesh_model_publish_update_evt_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.

Public Members

esp_ble_mesh_model_t *model
    Pointer to the model which is going to update its publish message

struct ble_mesh_model_send_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.

Public Members

int err_code
    Indicate the result of sending a message

uint32_t opcode
    Opcode of the message
```

2.1. Bluetooth API
**Public Members**

- `int err_code`
  - Indicate the result of updating server model state

- `esp_ble_mesh_model_t *model`
  - Pointer to the server model which state value is updated

- `esp_ble_mesh_server_state_type_t type`
  - Type of the updated server state

**Structures**

**struct esp_ble_mesh_deinit_param_t**

- BLE Mesh deinit parameters

**Public Members**

- `bool erase_flash`
  - Indicate if erasing flash when deinit mesh stack

**struct esp_ble_mesh_elem_t**

- Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in mesh_access.h

**Public Members**

- `uint16_t element_addr`
  - Element Address, assigned during provisioning.

- `const uint16_t location`
  - Location Descriptor (GATT Bluetooth Namespace Descriptors)

- `const uint8_t sig_model_count`
  - SIG Model count

- `const uint8_t vnd_model_count`
  - Vendor Model count

- `esp_ble_mesh_model_t *sig_models`
  - SIG Models

- `esp_ble_mesh_model_t *vnd_models`
  - Vendor Models
struct esp_ble_mesh_model_pub_t
Abstraction that describes a model publication context. This structure is associated with struct bt_mesh_model_pub in mesh_access.h

Public Members

esp_ble_mesh_model_t *model
Pointer to the model to which the context belongs. Initialized by the stack.

uint16_t publish_addr
Publish Address.

uint16_t app_idx
Publish AppKey Index.

uint16_t cred
Friendship Credentials Flag.

uint16_t send_rel
Force reliable sending (segment acks)

uint8_t ttl
Publish Time to Live.

uint8_t retransmit
Retransmit Count & Interval Steps.

uint8_t period
Publish Period.

uint8_t period_div
Divisor for the Period.

uint8_t fast_period
Use FastPeriodDivisor

uint8_t count
Retransmissions left.

uint32_t period_start
Start of the current period.

struct net_buf_simple *msg
Publication buffer, containing the publication message.

This will get correctly created when the publication context has been defined using the ESP_BLE_MESH_MODEL_PUB_DEFINE macro.

ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);

esp_ble_mesh_cb_t update
Callback used to update publish message. Initialized by the stack.

struct k_delayed_work timer
Publish Period Timer. Initialized by the stack.

uint8_t dev_role
Role of the device that is going to publish messages

struct esp_ble_mesh_model_op_t
Abstraction that describes a model operation context. This structure is associated with struct bt_mesh_model_op in mesh_access.h

2.1. Bluetooth API
Public Members

const uint32_t opcode
   Message opcode

const size_t min_len
   Message minimum length

esp_ble_mesh_cb_t param_cb
   Callback used to handle message. Initialized by the stack.

struct esp_ble_mesh_model
   Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in mesh_access.h

Public Members

union esp_ble_mesh_model::[anonymous] [anonymous]
   Model ID

uint8_t element_idx
   Internal information, mainly for persistent storage Belongs to Nth element

uint8_t model_idx
   Is the Nth model in the element

uint16_t flags
   Information about what has changed

esp_ble_mesh_elem_t *element
   The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const pub
   Model Publication

uint16_t [CONFIG_BLE_MESH_MODEL_KEY_COUNT] keys
   AppKey List

uint16_t [CONFIG_BLE_MESH_MODEL_GROUP_COUNT] groups
   Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t *op
   Model operation context

void *user_data
   Model-specific user data

struct esp_ble_mesh_msg_ctx_t
   Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h

Public Members

uint16_t net_idx
   NetKey Index of the subnet through which to send the message.

uint16_t app_idx
   AppKey Index for message encryption.

uint16_t addr
   Remote address.
uint16_t recv_dst
Destination address of a received message. Not used for sending.

int8_t recv_rssi
RSSI of received packet. Not used for sending.

uint8_t recv_ttl
Received TTL value. Not used for sending.

uint8_t send_rel
Force sending reliably by using segment acknowledgement

uint8_t send_ttl
TTL, or BLE_MESH_TTL_DEFAULT for default TTL.

uint32_t recv_op
Opcode of a received message. Not used for sending message.

*esp_ble_mesh_model_t model
Model corresponding to the message, no need to be initialized before sending message

bool srv_send
Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct esp_ble_mesh_prov_t
Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

struct esp_ble_mesh_comp_t
Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h

Public Members

uint16_t cid
16-bit SIG-assigned company identifier

uint16_t pid
16-bit vendor-assigned product identifier

uint16_t vid
16-bit vendor-assigned product version identifier

size_t element_count
Element count

*esp_ble_mesh_elem_t elements
A sequence of elements

struct esp_ble_mesh_unprov_dev_add_t
Information of the device which is going to be added for provisioning.

Public Members

*esp_ble_mesh_bd_addr_t addr
Device address

*esp_ble_mesh_addr_type_t addr_type
Device address type

uint8_t uuid[16]
Device UUID
```c
uint16_t oob_info
    Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled.

esp_ble_mesh_prov_bearer_t bearer
    Provisioning Bearer

struct esp_ble_mesh_device_delete_t
    Information of the device which is going to be deleted.

    Public Members

    esp_ble_mesh_bd_addr_t addr
        Device address

    esp_ble_mesh_addr_type_t addr_type
        Device address type

    uint8_t uuid[16]
        Device UUID

    uint8_t flag
        BIT0: device address; BIT1: device UUID

struct esp_ble_mesh_prov_data_info_t
    Information of the provisioner which is going to be updated.

    Public Members

    uint16_t net_idx
        NetKey Index

    uint8_t flags
        Flags

    uint32_t iv_index
        IV Index

    uint8_t flag
        BIT0: net_idx; BIT1: flags; BIT2: iv_index

struct esp_ble_mesh_node_t
    Information of the provisioned node

    Public Members

    esp_ble_mesh_bd_addr_t addr
        Node device address

    esp_ble_mesh_addr_type_t addr_type
        Node device address type

    uint8_t dev_uuid[16]
        Device UUID

    uint16_t oob_info
        Node OOB information
```
uint16_t unicast_addr
    Node unicast address

uint8_t element_num
    Node element number

uint16_t net_idx
    Node NetKey Index

uint8_t flags
    Node key refresh flag and iv update flag

uint32_t iv_index
    Node IV Index

uint8_t dev_key[16]
    Node device key

cchar name[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]
    Node name

uint16_t comp_length
    Length of Composition Data

uint8_t *comp_data
    Value of Composition Data

struct esp_ble_mesh_fast_prov_info_t
    Context of fast provisioning which need to be set.

Public Members

uint16_t unicast_min
    Minimum unicast address used for fast provisioning

uint16_t unicast_max
    Maximum unicast address used for fast provisioning

uint16_t net_idx
    Netkey index used for fast provisioning

uint8_t flags
    Flags used for fast provisioning

uint32_t iv_index
    IV Index used for fast provisioning

uint8_t offset
    Offset of the UUID to be compared

uint8_t match_len
    Length of the UUID to be compared

uint8_t match_val[16]
    Value of UUID to be compared

struct esp_ble_mesh_ble_adv_param_t
    Context of BLE advertising parameters.

2.1. Bluetooth API
Public Members

- `uint16_t interval`: BLE advertising interval
- `uint8_t adv_type`: BLE advertising type
- `uint8_t own_addr_type`: Own address type
- `uint8_t peer_addr_type`: Peer address type
- `uint8_t peer_addr[BD_ADDR_LEN]`: Peer address
- `uint16_t duration`: Duration is milliseconds
- `uint16_t period`: Period in milliseconds
- `uint16_t count`: Number of advertising duration
- `uint8_t priority`: Priority of BLE advertising packet

**struct esp_ble_mesh_ble_adv_data_t**
Context of BLE advertising data.

Public Members

- `uint8_t adv_data_len`: Advertising data length
- `uint8_t adv_data[31]`: Advertising data
- `uint8_t scan_rsp_data_len`: Scan response data length
- `uint8_t scan_rsp_data[31]`: Scan response data

**struct esp_ble_mesh_client_op_pair_t**
BLE Mesh client models related definitions.
Client model Get/Set message opcode and corresponding Status message opcode

Public Members

- `uint32_t cli_op`: The client message opcode
- `uint32_t status_op`: The server status opcode corresponding to the client message opcode

**struct esp_ble_mesh_client_t**
Client Model user data context.
Public Members

```c
esp_ble_mesh_model_t *model
  Pointer to the client model. Initialized by the stack.
```

```c
int op_pair_size
  Size of the op_pair
```

```c
const esp_ble_mesh_client_op_pair_t *op_pair
  Table containing get/set message opcode and corresponding status message opcode
```

```c
uint32_t publish_status
  Callback used to handle the received unsolicited message. Initialized by the stack.
```

```c
void *internal_data
  Pointer to the internal data of client model
```

```c
uint8_t msg_role
  Role of the device (Node/Provisioner) that is going to send messages
```

```c
struct esp_ble_mesh_client_common_param_t
  Common parameters of the messages sent by Client Model.
```

Public Members

```c
esp_ble_mesh_opcode_t opcode
  Message opcode
```

```c
esp_ble_mesh_model_t *model
  Pointer to the client model structure
```

```c
esp_ble_mesh_msg_ctx_t ctx
  The context used to send message
```

```c
int32_t msg_timeout
  Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0
```

```c
uint8_t msg_role
  Role of the device - Node/Provisioner
```

```c
struct esp_ble_mesh_state_transition_t
  Parameters of the server model state transition
```

Public Functions

```c
BLE_MESH_ATOMIC_DEFINE (flag, ESP_BLE_MESH_SERVER_FLAG_MAX)
  Flag used to indicate if the transition timer has been started internally.
```

If the model which contains `esp_ble_mesh_state_transition_t` sets “set_auto_rsp” to ESP_BLE_MESH_SERVER_RSP_BY_APP, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.
Public Members

bool just_started
Indicate if the state transition has just started

uint8_t trans_time
State transition time

uint8_t remain_time
Remaining time of state transition

uint8_t delay
Delay before starting state transition

uint32_t quo_tt
Duration of each divided transition step

uint32_t counter
Number of steps which the transition duration is divided

uint32_t total_duration
State transition total duration

int64_t start_timestamp
Time when the state transition is started

struct k_delayed_work timer
Timer used for state transition

struct esp_ble_mesh_last_msg_info_t
Parameters of the server model received last same set message.

Public Members

uint8_t tid
Transaction number of the last message

uint16_t src
Source address of the last message

uint16_t dst
Destination address of the last message

int64_t timestamp
Time when the last message is received

struct esp_ble_mesh_server_rsp_ctrl_t
Parameters of the Server Model response control

Public Members

uint8_t get_auto_rsp
BLE Mesh Server Response Option.

1. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Get messages need to be replied by the application;

2. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Get messages will be replied by the server models;
3. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Set messages need to be replied by the application;

4. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Set messages will be replied by the server models;

5. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Server Status messages need to be replied by the application;

6. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Server Status messages will be replied by the server models; Response control for Client Get messages

```c
uint8_t set_auto_rsp
    Response control for Client Set messages

uint8_t status_auto_rsp
    Response control for Server Status messages
```

Macros

```c
ESP_BLE_HOST_STATUS_ENABLED
ESP_BLE_HOST_STATUS_CHECK (status)
    The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC

ESP_BLE_MESH_SDU_MAX_LEN
    Length of a short Mesh MIC.

ESP_BLE_MESH_MIC_SHORT
    Length of a long Mesh MIC.

ESP_BLE_MESH_MIC_LONG
    The maximum length of a BLE Mesh provisioned node name

ESP_BLE_MESH_NODE_NAME_MAX_LEN
    The maximum length of a BLE Mesh unprovisioned device name

ESP_BLE_MESH_DEVICE_NAME_MAX_LEN
    Define the BLE Mesh octet 16 bytes size

ESP_BLE_MESH_OCTET16_LEN
ESP_BLE_MESH_OCTET8_LEN

ESP_BLE_MESH_ADDR_UNASSIGNED
ESP_BLE_MESH_ADDR_ALL_NODES
ESP_BLE_MESH_ADDR_PROXIES
ESP_BLE_MESH_ADDR_FRIENDS
ESP_BLE_MESH_ADDR_RELAYS
ESP_BLE_MESH_KEY_UNUSED
ESP_BLE_MESH_KEY_DEV
ESP_BLE_MESH_KEY_PRIMARY
ESP_BLE_MESH_KEY_ANY
    Primary Network Key index
```
ESP_BLE_MESH_NET_PRIMARY
   Relay state value
ESP_BLE_MESH_RELAY_DISABLED
ESP_BLE_MESH_RELAY_ENABLED
ESP_BLE_MESH_RELAY_NOT_SUPPORTED
   Beacon state value
ESP_BLE_MESH_BEACON_DISABLED
ESP_BLE_MESH_BEACON_ENABLED
ESP_BLE_MESH_GATT_PROXY_DISABLED
ESP_BLE_MESH_GATT_PROXY_ENABLED
ESP_BLE_MESH_GATT_PROXY_NOT_SUPPORTED
   GATT Proxy state value
ESP_BLE_MESH_FRIEND_DISABLED
ESP_BLE_MESH_FRIEND_ENABLED
ESP_BLE_MESH_FRIEND_NOT_SUPPORTED
   Friend state value
ESP_BLE_MESH_NODE_IDENTITY_STOPPED
ESP_BLE_MESH_NODE_IDENTITY_RUNNING
ESP_BLE_MESH_NODE_IDENTITY_NOT_SUPPORTED
   Node identity state value
ESP_BLE_MESH_FEATURE_RELAY
ESP_BLE_MESH_FEATURE_PROXY
ESP_BLE_MESH_FEATURE_FRIEND
ESP_BLE_MESH_FEATURE_LOW_POWER
ESP_BLE_MESH_FEATURE_ALL_SUPPORTED
ESP_BLE_MESH_ADDR_IS_UNICAST(addr)
ESP_BLE_MESH_ADDR_IS_GROUP(addr)
ESP_BLE_MESH_ADDR_IS_VIRTUAL(addr)
ESP_BLE_MESH_ADDR_IS_RFU(addr)
ESP_BLE_MESH_INVALID_NODE_INDEX
ESP_BLE_MESH_TRANSMIT(count, int_ms)
   Encode transmission count & interval steps.

   Note For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about
   90ms(count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

   Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

   Parameters
   * count: Number of retransmissions (first transmission is excluded).
• int_ms: Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

```c
ESP_BLE_MESH_GET_TRANSMIT_COUNT (transmit)
Decoding transmit count from a transmit value.
```

- **Return**: Transmission count (actual transmissions equal to N + 1).
- **Parameters**
  - transmit: Encoded transmit count & interval value.

```
ESP_BLE_MESH_GET_TRANSMIT_INTERVAL (transmit)
Decoding transmit interval from a transmit value.
```

- **Return**: Transmission interval in milliseconds.
- **Parameters**
  - transmit: Encoded transmit count & interval value.

```
ESP_BLE_MESH_PUBLISH_TRANSMIT (count, int_ms)
Encoding Publish Retransmit count & interval steps.
```

- **Return**: BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.
- **Parameters**
  - count: Number of retransmissions (first transmission is excluded).
  - int_ms: Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

```
ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT (transmit)
Decoding Publish Retransmit count from a given value.
```

- **Return**: Retransmission count (actual transmissions equal to N + 1).
- **Parameters**
  - transmit: Encoded Publish Retransmit count & interval value.

```
ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL (transmit)
Decoding Publish Retransmit interval from a given value.
```

- **Return**: Transmission interval in milliseconds.
- **Parameters**
  - transmit: Encoded Publish Retransmit count & interval value.

```
ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN
Maximum length of string used by Output OOB authentication
```

```
ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN
Maximum length of string used by Output OOB authentication
```

```
ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN
Macros used to define message opcode
```

```
ESP_BLE_MESH_MODEL_OP_1 (b0)
```

```
ESP_BLE_MESH_MODEL_OP_2 (b0, b1)
```

2.1. Bluetooth API
ESP_BLE_MESH_MODEL_OP_3 (b0, cid)
This macro is associated with BLE_MESH_MODEL in mesh_access.h

ESP_BLE_MESH_SIG_MODEL (_id, _op, _pub, _user_data)
This macro is associated with BLE_MESH_MODEL_VND in mesh_access.h

ESP_BLE_MESH_VENDOR_MODEL (_company, _id, _op, _pub, _user_data)

ESP_BLE_MESH_ELEMENT (_loc, _mods, _vnd_mods)
Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

Note This macro is associated with BLE_MESH_ELEM in mesh_access.h

Parameters

• _loc: Location Descriptor.
• _mods: Array of SIG models.
• _vnd_mods: Array of vendor models.

ESP_BLE_MESH_PROV (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

BT_OCTET32_LEN

BD_ADDR_LEN

ESP_BLE_MESH_ADDR_TYPE_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RANDOM

ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM

ESP_BLE_MESH_MODEL_PUB_DEFINE (_name, _msg_len, _role)
Define a model publication context.

Parameters

• _name: Variable name given to the context.
• _msg_len: Length of the publication message.
• _role: Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (_opcode, _min_len)
Define a model operation context.

Parameters

• _opcode: Message opcode.
• _min_len: Message minimum length.

ESP_BLE_MESH_MODEL_OP_END
Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.
ESP_BLE_MESH_MODEL_NONE
Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG
Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG
Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG
Device can be remove when queue is full and new device is going to added

DEL_DEV_ADDR_FLAG
DEL_DEV_UUID_FLAG
PROV_DATA_NET_IDX_FLAG
PROV_DATA_FLAGS_FLAG
PROV_DATA_IV_INDEX_FLAG

ESP_BLE_MESH_BLE_ADV_INFINITE
Count for sending BLE advertising packet infinitely. This enum value is the priority of BLE advertising packet

ESP_BLE_MESH_MODEL_ID_CONFIG_SRV
BLE Mesh models related Model ID and Opcode definitions.

Response need to be sent in the application

**Type Definitions**

typedef uint8_t esp_ble_mesh_octet16_t [ESP_BLE_MESH_OCTET16_LEN]
Define the BLE Mesh octet 8 bytes size

typedef uint8_t esp_ble_mesh_octet8_t [ESP_BLE_MESH_OCTET8_LEN]

typedef uint32_t esp_ble_mesh_cb_t

typedef uint8_t UINT8

typedef uint16_t UINT16

typedef uint32_t UINT32

typedef uint64_t UINT64

typedef UINT8 BT_OCTET32 [BT_OCTET32_LEN]

typedef uint8_t BD_ADDR [BD_ADDR_LEN]

typedef uint8_t esp_ble_mesh_bd_addr_t [BD_ADDR_LEN]

BLE device address type.

typedef struct esp_ble_mesh_model esp_ble_mesh_model_t

typedef uint8_t esp_ble_mesh_dev_add_flag_t

typedef uint32_t esp_ble_mesh_opcode_config_client_get_t
esp_ble_mesh_opcode_config_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in the esp_ble_mesh_config_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_config_client_set_t
esp_ble_mesh_opcode_config_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_set_state. The following opcodes will only be used in the esp_ble_mesh_config_client_set_state function.

typedef uint32_t esp_ble_mesh_opcode_config_status_t
esp_ble_mesh_opcode_config_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Config Model messages The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model’s request messages.

typedef uint8_t esp_ble_mesh_cfg_status_t
This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

2.1. Bluetooth API
typedef uint32_t esp_ble_mesh_opcode_health_client_set_t
esp_ble_mesh_opcode_health_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_set_state. The following opcodes will only be used in the esp_ble_mesh_health_client_set_state function.

typedef uint32_t esp_ble_mesh_health_model_status_t
esp_ble_mesh_health_model_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model’s request messages.

typedef uint32_t esp_ble_mesh_generic_message_opcode_t
esp_ble_mesh_generic_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_generic_client_get_state & esp_ble_mesh_generic_client_set_state. Generic OnOff Message Opcode

typedef uint32_t esp_ble_mesh_sensor_message_opcode_t
esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state. Sensor Message Opcode

typedef uint32_t esp_ble_mesh_time_scene_message_opcode_t
esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state. Time Message Opcode

typedef uint32_t esp_ble_mesh_light_message_opcode_t
esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state. Light Lightness Message Opcode

typedef uint32_t esp_ble_mesh_opcode_t
End of defines of esp_ble_mesh_opcode_t

typedef uint8_t esp_ble_mesh_model_status_t
This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

    Values:
    ESP_BLE_MESH_BLE_ADV_PRIO_LOW
    ESP_BLE_MESH_BLE_ADV_PRIO_HIGH

enum esp_ble_mesh_prov_cb_event_t
    Values:
    ESP_BLE_MESH_PROV_REGISTER_COMP_EVT
        Initialize BLE Mesh provisioning capabilities and internal data information completion event
    ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT
        Set the unprovisioned device name completion event
    ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
        Enable node provisioning functionality completion event
    ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT
        Disable node provisioning functionality completion event
    ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT
        Establish a BLE Mesh link event
    ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT
        Close a BLE Mesh link event
    ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT
        Generate Node input OOB public key event
    ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT
        Generate Node Output Number event
    ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
        Generate Node Output String event
ESP_BLE_MESH_NODE_PROV_INPUT_EVT
Event requiring the user to input a number or string

ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT
Provisioning done event

ESP_BLE_MESH_NODE_PROV_RESET_EVT
Provisioning reset event

ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT
Node set oob public key completion event

ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT
Node input number completion event

ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT
Node input string completion event

ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT
Enable BLE Mesh Proxy Identity advertising completion event

ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT
Enable BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT
Disable BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT
Provisioner enable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT
Provisioner disable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT
Provisioner receives unprovisioned device beacon event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT
Provisioner read unprovisioned device OOB public key event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT
Provisioner input value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT
Provisioner output value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT
Provisioner establish a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT
Provisioner close a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT
Provisioner provisioning done event

ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event

ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT
Provisioner start to provision an unprovisioned device completion event

ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT
Provisioner delete a device from the list, close provisioning link with the device if it exists and remove the device from network completion event
ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT
Provisioner set net_idx/flags/iv_index used for provisioning completion event

ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT
Provisioner set static oob value used for provisioning completion event

ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT
Provisioner set unicast address of primary element completion event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT
Provisioner read unprovisioned device OOB public key completion event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT
Provisioner input number completion event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT
Provisioner input string completion event

ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT
Provisioner set node name completion event

ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT
Provisioner add local app key completion event

ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT
Provisioner update local app key completion event

ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT
Provisioner bind local model with local app key completion event

ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT
Provisioner add local network key completion event

ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT
Provisioner update local network key completion event

ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT
Provisioner store node composition data completion event

ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT
Provisioner delete node with uuid completion event

ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT
Provisioner delete node with unicast address completion event

ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT
Set fast provisioning action completion event

ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT
Receive Heartbeat message event

ESP_BLE_MESH_LPN_ENABLE_COMP_EVT
Enable Low Power Node completion event

ESP_BLE_MESH_LPN_DISABLE_COMP_EVT
Disable Low Power Node completion event
ESP_BLE_MESH_LPN_POLL_COMP_EVT
Low Power Node send Friend Poll completion event

ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT
Low Power Node establishes friendship event

ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT
Low Power Node terminates friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT
Friend Node establishes friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT
Friend Node terminates friendship event

ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT
Proxy Client receives Network ID advertising packet event

ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT
Proxy Client establishes connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT
Proxy Client terminates connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT
Proxy Client receives Proxy Filter Status event

ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT
Proxy Client connect completion event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT
Proxy Client disconnect completion event

ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT
Proxy Client set filter type completion event

ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT
Proxy Client add filter address completion event

ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT
Proxy Client remove filter address completion event

ESP_BLE_MESH_START_BLE_ADVERTISING_COMP_EVT
Start BLE advertising completion event

ESP_BLE_MESH_STOP_BLE_ADVERTISING_COMP_EVT
Stop BLE advertising completion event

ESP_BLE_MESH_DEINIT_MESH_COMP_EVT
De-initialize BLE Mesh stack completion event

ESP_BLE_MESH_PROV_EVT_MAX
enum [anonymous]
BLE Mesh server models related definitions.
This enum value is the flag of transition timer operation

Values:
ESP_BLE_MESH_SERVER_TRANS_TIMER_START
ESP_BLE_MESH_SERVER_FLAG_MAX
enum esp_ble_mesh_server_state_type_t
This enum value is the type of server model states

Values:
- ESP_BLE_MESH_GENERIC_ONOFF_STATE
- ESP_BLE_MESH_GENERIC_LEVEL_STATE
- ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE
- ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE
- ESP_BLE_MESH_LIGHT_LIGHTNESS_ACTUAL_STATE
- ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE
- ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE
- ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE
- ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE
- ESP_BLE_MESH_LIGHT_HSL_HUE_STATE
- ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE
- ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE
- ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE
- ESP_BLE_MESH_SERVER_MODEL_STATE_MAX

enum esp_ble_mesh_model_cb_event_t
Values:
- ESP_BLE_MESH_MODEL_OPERATION_EVT
  User-defined models receive messages from peer devices (e.g. get, set, status, etc) event
- ESP_BLE_MESH_MODEL_SEND_COMP_EVT
  User-defined models send messages completion event
- ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
  User-defined models publish messages completion event
- ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
  User-defined client models receive publish messages event
- ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
  Timeout event for the user-defined client models that failed to receive response from peer server models
- ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
  When a model is configured to publish messages periodically, this event will occur during every publish period
- ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
  Server models update state value completion event
- ESP_BLE_MESH_MODEL_EVT_MAX

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:
• ESP-BLE-MESH Stack Initialization
• Reading of Local Data Information
• Low Power Operation (Updating)
• Send/Publish Messages, add Local AppKey, etc.
• ESP-BLE-MESH Node/Provisioner Provisioning
• ESP-BLE-MESH GATT Proxy Server

ESP-BLE-MESH Stack Initialization

Header File

• bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h

Functions

```c
esp_err_t esp_ble_mesh_init(esp_ble_mesh_prov_t *prov, esp_ble_mesh_comp_t *comp)
```

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

**Note** After calling this API, the device needs to call esp_ble_mesh_prov_enable() to enable provisioning functionality again.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `prov`: Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- `comp`: Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

```c
esp_err_t esp_ble_mesh_deinit(esp_ble_mesh_deinit_param_t *param)
```

De-initialize BLE Mesh module.

**Note** This function shall be invoked after esp_ble_mesh_client_model_deinit().

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `param`: Pointer to the structure of BLE Mesh deinit parameters.

Reading of Local Data Information

Header File

• bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h
Functions

```c
int32_t esp_ble_mesh_get_model_publish_period(esp_ble_mesh_model_t *model)
Get the model publish period, the unit is ms.
```

**Return**  Publish period value on success, 0 or (negative) error code from errno.h on failure.

**Parameters**
- `model`: Model instance pointer.

```c
uint16_t esp_ble_mesh_get_primary_element_address(void)
Get the address of the primary element.
```

**Return**  Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.

```c
uint16_t *esp_ble_mesh_is_model_subscribed_to_group(esp_ble_mesh_model_t *model, uint16_t group_addr)
Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.
```

**Return**  Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

**Parameters**
- `model`: Pointer to the model.
- `group_addr`: Group address.

```c
esp_ble_mesh_elem_t *esp_ble_mesh_find_element(uint16_t element_addr)
Find the BLE Mesh element pointer via the element address.
```

**Return**  Pointer to the element on success, or NULL on failure.

**Parameters**
- `element_addr`: Element address.

```c
uint8_t esp_ble_mesh_get_element_count(void)
Get the number of elements that have been registered.
```

**Return**  Number of elements.

```c
esp_ble_mesh_model_t *esp_ble_mesh_find_vendor_model(const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id)
Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.
```

**Return**  Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

**Parameters**
• **element**: Element to which the model belongs.
• **company_id**: A 16-bit company identifier assigned by the Bluetooth SIG.
• **model_id**: A 16-bit vendor-assigned model identifier.

```c
esp_ble_mesh_model_t *esp_ble_mesh_find_sig_model(const esp_ble_mesh_elem_t *element, uint16_t model_id)
```

Find the SIG model with the given element and Model id.

**Return** Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

**Parameters**
• **element**: Element to which the model belongs.
• **model_id**: SIG model identifier.

```c
const esp_ble_mesh_comp_t *esp_ble_mesh_get_composition_data(void)
```

Get the Composition data which has been registered.

**Return** Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

### Low Power Operation (Updating)

**Header File**

- `bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h`

**Functions**

```c
esp_err_t esp_ble_mesh_lpn_enable(void)
```

Enable BLE Mesh device LPN functionality.

**Note** This API enables LPN functionality. Once called, the proper Friend Request will be sent.

**Return** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_lpn_disable(bool force)
```

Disable BLE Mesh device LPN functionality.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
• **force**: when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

```c
esp_err_t esp_ble_mesh_lpn_poll(void)
```

LPN tries to poll messages from the Friend Node.

**Note** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout...
timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

**Return** ESP_OK on success or error code otherwise.

### Send/Publish Messages, add Local AppKey, etc.

**Header File**

- bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h

**Functions**

```c
esp_err_t esp_ble_mesh_register_custom_model_callback(esp_ble_mesh_model_cb_t callback)
```

Register BLE Mesh callback for user-defined models’ operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call esp_ble_mesh_server/client_model_send, this callback notifies the application layer of the send_complete event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**Note** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, esp_ble_mesh_register_config_client_callback is the register function for Config Client Model.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `callback`: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_model_msg_opcode_init(uint8_t *data, uint32_t opcode)
```

Add the message opcode to the beginning of the model message before sending or publishing the model message.

**Note** This API is only used to set the opcode of the message.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `data`: Pointer to the message data.
- `opcode`: The message opcode.

```c
esp_err_t esp_ble_mesh_client_model_init(esp_ble_mesh_model_t *model)
```

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the
client model internal data. Node: Before calling this API, the op_pair_size and op_pair variabled within the user_data(defined using esp_ble_mesh_client_t) of the client model need to be initialized.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **model**: BLE Mesh Client model to which the message belongs.

```c
esp_err_t esp_ble_mesh_client_model_deinit(esp_ble_mesh_model_t *model)
```

De-initialize the user-defined client model.

**Note** This function shall be invoked before esp_ble_mesh_deinit() is called.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **model**: Pointer of the Client model.

```c
esp_err_t esp_ble_mesh_server_model_send_msg(esp_ble_mesh_model_t *model,
                                          esp_ble_mesh_msg_ctx_t *ctx,
                                          uint32_t opcode,
                                          uint16_t length,
                                          uint8_t *data)
```

Send server model messages(such as server model status messages).

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **model**: BLE Mesh Server Model to which the message belongs.
- **ctx**: Message context, includes keys, TTL, etc.
- **opcode**: Message opcode.
- **length**: Message length (exclude the message opcode).
- **data**: Parameters of Access Payload (exclude the message opcode) to be sent.

```c
esp_err_t esp_ble_mesh_client_model_send_msg(esp_ble_mesh_model_t *model,
                                         esp_ble_mesh_msg_ctx_t *ctx,
                                         uint32_t opcode,
                                         uint16_t length,
                                         uint8_t *data,
                                         int32_t msg_timeout,
                                         bool need_rsp,
                                         esp_ble_mesh_dev_role_t device_role)
```

Send client model message (such as model get, set, etc).

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **model**: BLE Mesh Client Model to which the message belongs.
- **ctx**: Message context, includes keys, TTL, etc.
- **opcode**: Message opcode.
- **length**: Message length (exclude the message opcode).
- **data**: Parameters of the Access Payload (exclude the message opcode) to be sent.
- **msg_timeout**: Time to get response to the message (in milliseconds).
- **need_rsp**: TRUE if the opcode requires the peer device to reply, FALSE otherwise.
• device_role: Role of the device (Node/Provisioner) that sends the message.

```c
esp_err_t esp_ble_mesh_model_publish(esp_ble_mesh_model_t *model, uint32_t opcode, uint16_t length, uint8_t *data, esp_ble_mesh_dev_role_t device_role)
```

Send a model publication message.

**Note** Before calling this function, the user needs to ensure that the model publication message (esp_ble_mesh_model_pub_t::msg) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- model: Mesh (client) Model publishing the message.
- opcode: Message opcode.
- length: Message length (exclude the message opcode).
- data: Parameters of the Access Payload (exclude the message opcode) to be sent.
- device_role: Role of the device (node/provisioner) publishing the message of the type esp_ble_mesh_dev_role_t.

```c
esp_err_t esp_ble_mesh_server_model_update_state(esp_ble_mesh_model_t *model, esp_ble_mesh_server_state_type_t type, esp_ble_mesh_server_state_value_t *value)
```

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

**Note** Currently this API is used to update bound state value, not for all server model states.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- model: Server model which is going to update the state.
- type: Server model state type.
- value: Server model state value.

```c
esp_err_t esp_ble_mesh_node_local_reset (void)
```

Reset the provisioning procedure of the local BLE Mesh node.

**Note** All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function esp_ble_mesh_node_prov_enable() needs to be called to start a new provisioning procedure.

**Return** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_node_name (uint16_t index, const char *name)
```

This function is called to set the node (provisioned device) name.

**Note** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
const char *esp_ble_mesh_provisioner_get_node_name(uint16_t index)

This function is called to get the node (provisioned device) name.

Note index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

Return Node name on success, or NULL on failure.

Parameters

• index: Index of the node in the node queue.

uint16_t esp_ble_mesh_provisioner_get_node_index(const char *name)

This function is called to get the node (provisioned device) index.

Return Node index on success, or an invalid value (0xFFFF) on failure.

Parameters

• name: Name of the node (end by ‘\0’).

esp_err_t esp_ble_mesh_provisioner_store_node_comp_data(uint16_t unicast_addr, uint8_t *data, uint16_t length)

This function is called to store the Composition Data of the node.

Return ESP_OK on success or error code otherwise.

Parameters

• unicast_addr: Element address of the node
• data: Pointer of Composition Data
• length: Length of Composition Data

esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_uuid(const uint8_t uuid[16])

This function is called to get the provisioned node information with the node device uuid.

Return Pointer of the node info struct or NULL on failure.

Parameters

• uuid: Device UUID of the node

esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_addr(uint16_t unicast_addr)

This function is called to get the provisioned node information with the node unicast address.

Return Pointer of the node info struct or NULL on failure.

Parameters

• unicast_addr: Unicast address of the node

esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid(const uint8_t uuid[16])

This function is called to delete the provisioned node information with the node device uuid.

Return ESP_OK on success or error code otherwise.
Parameters

- **uuid**: Device UUID of the node

```c
esp_err_t esp_ble_mesh_provisioner_delete_node_with_addr(uint16_t unicast_addr)
```

This function is called to delete the provisioned node information with the node unicast address.

**Return**

ESP_OK on success or error code otherwise.

**Parameters**

- **unicast_addr**: Unicast address of the node

```c
esp_err_t esp_ble_mesh_provisioner_add_local_app_key(const uint8_t app_key[16],
                                                      uint16_t net_idx,
                                                      uint16_t app_idx)
```

This function is called to add a local AppKey for Provisioner.

**Note**

- **app_key**: If set to NULL, app_key will be generated internally.
- **net_idx**: Should be an existing one.
- **app_idx**: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be reported via an event.

**Return**

ESP_OK on success or error code otherwise.

**Parameters**

- **app_key**: The app key to be set for the local BLE Mesh stack.
- **net_idx**: The network key index.
- **app_idx**: The app key index.

```c
esp_err_t esp_ble_mesh_provisioner_update_local_app_key(const uint8_t app_key[16],
                                                      uint16_t net_idx,
                                                      uint16_t app_idx)
```

This function is used to update a local AppKey for Provisioner.

**Return**

ESP_OK on success or error code otherwise.

**Parameters**

- **app_key**: Value of the AppKey.
- **net_idx**: Corresponding NetKey Index.
- **app_idx**: The AppKey Index

```c
const uint8_t *esp_ble_mesh_provisioner_get_local_app_key(uint16_t net_idx, uint16_t app_idx)
```

This function is called by Provisioner to get the local app key value.

**Return**

App key on success, or NULL on failure.

**Parameters**

- **net_idx**: Network key index.
- **app_idx**: Application key index.
esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model(uint16_t element_addr, uint16_t app_idx, uint16_t model_id, uint16_t company_id)

This function is called by Provisioner to bind own model with proper app key.

**Note** company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `element_addr`: Provisioner local element address
- `app_idx`: Provisioner local appkey index
- `model_id`: Provisioner local model id
- `company_id`: Provisioner local company id

esp_err_t esp_ble_mesh_provisioner_add_local_net_key(const uint8_t net_key[16], uint16_t net_idx)

This function is called by Provisioner to add local network key.

**Note** net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `net_key`: The network key to be added to the Provisioner local BLE Mesh stack.
- `net_idx`: The network key index.

esp_err_t esp_ble_mesh_provisioner_update_local_net_key(const uint8_t net_key[16], uint16_t net_idx)

This function is called by Provisioner to update a local network key.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `net_key`: Value of the NetKey.
- `net_idx`: The NetKey Index.

const uint8_t *esp_ble_mesh_provisioner_get_local_net_key(uint16_t net_idx)

This function is called by Provisioner to get the local network key value.

**Return** Network key on success, or NULL on failure.

**Parameters**

- `net_idx`: Network key index.

uint16_t esp_ble_mesh_provisioner_get_prov_node_count(void)

This function is called by Provisioner to get provisioned node count.

**Return** Number of the provisioned nodes.
\texttt{const \textbf{uint8_t} \*\textbf{esp\_ble\_mesh\_get\_fast\_prov\_app\_key} (uint16\_t \textit{net\_idx}, uint16\_t \textit{app\_idx})}

This function is called to get fast provisioning application key.

\textbf{Return} Application key on success, or NULL on failure.

\textbf{Parameters}

- \textit{net\_idx}: Network key index.
- \textit{app\_idx}: Application key index.

\textbf{Type Definitions}

\texttt{typedef \textbf{void} (*\textbf{esp\_ble\_mesh\_model\_cb\_t})(esp\_ble\_mesh\_model\_cb\_event\_t \textit{event},
esp\_ble\_mesh\_model\_cb\_param\_t *\textit{param})}

: \textit{event}, event code of user-defined model events; \textit{param}, parameters of user-defined model events

\textbf{ESP-BLE-MESH Node/Provisioner Provisioning}

\textbf{Header File}

- \texttt{bt/esp\_ble\_mesh/api/core/include/esp\_ble\_mesh\_provisioning\_api.h}

\textbf{Functions}

\texttt{esp\_err\_t \textbf{esp\_ble\_mesh\_register\_prov\_callback}(esp\_ble\_mesh\_prov\_cb\_t \textit{callback})}

Register BLE Mesh provisioning callback.

\textbf{Return} ESP_OK on success or error code otherwise.

\textbf{Parameters}

- \textit{callback}: Pointer to the callback function.

\texttt{bool \textbf{esp\_ble\_mesh\_node\_is\_provisioned}(void)}

Check if a device has been provisioned.

\textbf{Return} TRUE if the device is provisioned, FALSE if the device is unprovisioned.

\texttt{esp\_err\_t \textbf{esp\_ble\_mesh\_node\_prov\_enable}(esp\_ble\_mesh\_prov\_bearer\_t \textit{bearers})}

Enable specific provisioning bearers to get the device ready for provisioning.

\textbf{Note} PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

\textbf{Return} ESP_OK on success or error code otherwise.

\textbf{Parameters}

- \textit{bearers}: Bit-wise OR of provisioning bearers.

\texttt{esp\_err\_t \textbf{esp\_ble\_mesh\_node\_prov\_disable}(esp\_ble\_mesh\_prov\_bearer\_t \textit{bearers})}

Disable specific provisioning bearers to make a device inaccessible for provisioning.

\textbf{Return} ESP_OK on success or error code otherwise.
Parameters

• **bearers**: Bit-wise OR of provisioning bearers.

```c
esp_err_t esp_ble_mesh_node_set_oob_pub_key(uint8_t pub_key_x[32], uint8_t pub_key_y[32], uint8_t private_key[32])
```

Unprovisioned device set own oob public key & private key pair.

**Return** ESP_OK on success or error code otherwise.

Parameters

• **pub_key_x**: Unprovisioned device’s Public Key X
• **pub_key_y**: Unprovisioned device’s Public Key Y
• **private_key**: Unprovisioned device’s Private Key

```c
esp_err_t esp_ble_mesh_node_input_number(uint32_t number)
```

Provide provisioning input OOB number.

**Note** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.

**Return** ESP_OK on success or error code otherwise.

Parameters

• **number**: Number input by device.

```c
esp_err_t esp_ble_mesh_node_input_string(const char *string)
```

Provide provisioning input OOB string.

**Note** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

**Return** ESP_OK on success or error code otherwise.

Parameters

• **string**: String input by device.

```c
esp_err_t esp_ble_mesh_set_unprovisioned_device_name(const char *name)
```

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

**Note** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn’t apply to PB-ADV mode.

**Return** ESP_OK on success or error code otherwise.

Parameters

• **name**: Unprovisioned device name

```c
esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key(uint8_t link_idx, uint8_t pub_key_x[32], uint8_t pub_key_y[32])
```

Provisioner inputs unprovisioned device’s oob public key.

**Return** ESP_OK on success or error code otherwise.

---

2.1. Bluetooth API
Parameters

- **link_idx**: The provisioning link index
- **pub_key_x**: Unprovisioned device’s Public Key X
- **pub_key_y**: Unprovisioned device’s Public Key Y

`esp_err_t esp_ble_mesh_provisioner_input_string(const char *string, uint8_t link_idx)`

Provide provisioning input OOB string.

This is intended to be called after the `esp_ble_mesh_prov_t prov_input_num` callback has been called with ESP_BLE_MESH_ENTER_STRING as the action.

**Return**: ESP_OK on success or error code otherwise.

Parameters

- **string**: String input by Provisioner.
- **link_idx**: The provisioning link index.

`esp_err_t esp_ble_mesh_provisioner_input_number(uint32_t number, uint8_t link_idx)`

Provide provisioning input OOB number.

This is intended to be called after the `esp_ble_mesh_prov_t prov_input_num` callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the action.

**Return**: ESP_OK on success or error code otherwise.

Parameters

- **number**: Number input by Provisioner.
- **link_idx**: The provisioning link index.

`esp_err_t esp_ble_mesh_provisioner_prov_enable(esp_ble_mesh_prov_bearer_t bearers)`

Enable one or more provisioning bearers.

**Note**: PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

**Return**: ESP_OK on success or error code otherwise.

Parameters

- **bearers**: Bit-wise OR of provisioning bearers.

`esp_err_t esp_ble_mesh_provisioner_prov_disable(esp_ble_mesh_prov_bearer_t bearers)`

Disable one or more provisioning bearers.

**Note**: PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

**Return**: ESP_OK on success or error code otherwise.

Parameters

- **bearers**: Bit-wise OR of provisioning bearers.

`esp_err_t esp_ble_mesh_provisioner_add_unprov_dev(esp_ble_mesh_unprov_dev_add_t *add_dev, esp_ble_mesh_dev_add_flag_t flags)`

Add unprovisioned device info to the unprov_dev queue.
Return ESP_OK on success or error code otherwise.

Note: 1. Currently address type only supports public address and static random address.

1. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.

2. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device’s advertising packets, it will start provisioning the device internally.

   • In this situation, the Provisioner can set bearers with each one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.

3. Another example is when the Provisioner receives the unprovisioned device’s beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function esp_ble_mesh_register_prov_callback. And in the callback, the Provisioner can call this API to start provisioning the device.

   • If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.

   • If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.

   • If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD_DEV_START_PROV_NOW_FLAG enabled.

   • Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG can not be enabled at the same time.

Parameters

• add_dev: Pointer to a struct containing the device information

• flags: Flags indicate several operations on the device information
  – Remove device information from queue after device has been provisioned (BIT0)
  – Start provisioning immediately after device is added to queue (BIT1)
  – Device can be removed if device queue is full (BIT2)

```c
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr(const uint8_t uuid[16],
            esp_ble_mesh_bd_addr_t addr,
            esp_ble_mesh_addr_type_t addr_type,
            esp_ble_mesh_prov_bearer_t bearer, uint16_t oob_info,
            uint16_t unicast_addr)
```

2.1. Bluetooth API
Provision an unprovisioned device and assign a fixed unicast address for it in advance.

**Return** Zero on success or (negative) error code otherwise.

**Note**:
1. Currently address type only supports public address and static random address.
2. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.
3. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
4. Recommend to use only one of the functions “esp_ble_mesh_provisioner_add_unprov_dev” and “esp_ble_mesh_provisioner_prov_device_with_addr” by a Provisioner.

**Parameters**
- `uuid`: Device UUID of the unprovisioned device
- `addr`: Device address of the unprovisioned device
- `addr_type`: Device address type of the unprovisioned device
- `bearer`: Provisioning bearer going to be used by Provisioner
- `oob_info`: OOB info of the unprovisioned device
- `unicast_addr`: Unicast address going to be allocated for the unprovisioned device

```c
esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)
```
Delete device from queue, reset current provisioning link and reset the node.

**Note** If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure; if the device has already been provisioned, reset the device. And either one of the addr or device UUID can be input.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `del_dev`: Pointer to a struct containing the device information.

```c
esp_err_t esp_ble_mesh_provisioner_set_dev_uuid_match(const uint8_t *match_val,
                                                      uint8_t match_len,
                                                      uint8_t offset,
                                                      bool prov_after_match)
```
This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `match_val`: Value to be compared with the part of the device UUID.
- `match_len`: Length of the compared match value.
- `offset`: Offset of the device UUID to be compared (based on zero).
- `prov_after_match`: Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.
esp_err_t esp_ble_mesh_provisioner_set_prov_data_info(esp_ble_mesh_prov_data_info_t *prov_data_info)

This function is called by Provisioner to set provisioning data information before starting to provision.

Return ESP_OK on success or error code otherwise.

Parameters

• prov_data_info: Pointer to a struct containing net_idx or flags or iv_index.

esp_err_t esp_ble_mesh_provisioner_set_static_oob_value(const uint8_t *value, uint8_t length)

This function is called by Provisioner to set static oob value used for provisioning.

Return ESP_OK on success or error code otherwise.

Parameters

• value: Pointer to the static oob value.
• length: Length of the static oob value.

esp_err_t esp_ble_mesh_provisioner_set_primary_elem_addr(uint16_t addr)

This function is called by Provisioner to set own Primary element address.

Note This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct esp_ble_mesh_prov_t will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

Return ESP_OK on success or error code otherwise.

Parameters

• addr: Unicast address of the Primary element of Provisioner.

esp_err_t esp_ble_mesh_set_fast_prov_info(esp_ble_mesh_fast_prov_info_t *fast_prov_info)

This function is called to set provisioning data information before starting fast provisioning.

Return ESP_OK on success or error code otherwise.

Parameters

• fast_prov_info: Pointer to a struct containing unicast address range, net_idx, etc.

esp_err_t esp_ble_mesh_set_fast_prov_action(esp_ble_mesh_fast_prov_action_t action)

This function is called to start/suspend/exit fast provisioning.

Return ESP_OK on success or error code otherwise.

Parameters

• action: fast provisioning action (i.e. enter, suspend, exit).
Type Definitions

typedef void (*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event, esp_ble_mesh_prov_cb_param_t *param)

: event, event code of provisioning events; param, parameters of provisioning events

typedef void (*esp_ble_mesh_prov_adv_cb_t)(const esp_ble_mesh_bd_addr_t addr, const esp_ble_mesh_addr_type_t addr_type, const uint8_t adv_type, const uint8_t *dev_uuid, uint16_t oob_info, esp_ble_mesh_prov_bearer_t bearer)

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

Parameters

• addr: Pointer to the unprovisioned device address.
• addr_type: Unprovisioned device address type.
• adv_type: Adv packet type(ADV_IND or ADV_NONCONN_IND).
• dev_uuid: Unprovisioned device UUID pointer.
• oob_info: OOB information of the unprovisioned device.
• bearer: Adv packet received from PB-GATT or PB-ADV bearer.

ESP-BLE-MESH GATT Proxy Server

Header File

• bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h

Functions

esp_err_t esp_ble_mesh_proxy_identity_enable(void)

Enable advertising with Node Identity.

Note This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

Return ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_proxy_gatt_enable(void)

Enable BLE Mesh GATT Proxy Service.

Return ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_proxy_gatt_disable(void)

Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.
Return ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_connect(esp_ble_mesh_bd_addr_t addr,
                                        esp_ble_mesh_addr_type_t addr_type,
                                        uint16_t net_idx)
```

Proxy Client creates a connection with the Proxy Server.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `addr`: Device address of the Proxy Server.
- `addr_type`: Device address type (public or static random).
- `net_idx`: NetKey Index related with Network ID in the Mesh Proxy advertising packet.

```c
esp_err_t esp_ble_mesh_proxy_client_disconnect(uint8_t conn_handle)
```

Proxy Client terminates a connection with the Proxy Server.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `conn_handle`: Proxy connection handle.

```c
esp_err_t esp_ble_mesh_proxy_client_set_filter_type(uint8_t conn_handle,
                                                    uint16_t net_idx,
                                                    esp_ble_mesh_proxy_filter_type_t filter_type)
```

Proxy Client sets the filter type of the Proxy Server.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `conn_handle`: Proxy connection handle.
- `net_idx`: Corresponding NetKey Index.
- `filter_type`: whitelist or blacklist.

```c
esp_err_t esp_ble_mesh_proxy_client_add_filter_addr(uint8_t conn_handle,
                                                    uint16_t net_idx,
                                                    uint16_t *addr, uint16_t addr_num)
```

Proxy Client adds address to the Proxy Server filter list.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `conn_handle`: Proxy connection handle.
- `net_idx`: Corresponding NetKey Index.
- `addr`: Pointer to the filter address.
- `addr_num`: Number of the filter address.
```
esp_err_t esp_ble_mesh_proxy_client_remove_filter_addr(uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)
```

Proxy Client removes address from the Proxy Server filter list.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **conn_handle**: Proxy connection handle.
- **net_idx**: Corresponding NetKey Index.
- **addr**: Pointer to the filter address.
- **addr_num**: Number of the filter address.

**ESP-BLE-MESH Models API Reference**

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:
- **Configuration Client/Server Models**
- **Health Client/Server Models**
- **Generic Client/Server Models**
- **Sensor Client/Server Models**
- **Time and Scenes Client/Server Models**
- **Lighting Client/Server Models**

**Note**: Definitions related to Server Models are being updated, and will be released soon.

**Configuration Client/Server Models**

**Header File**
- `bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h`

**Functions**

```
esp_err_t esp_ble_mesh_register_config_client_callback(esp_ble_mesh_cfg_client_cb_t callback)
```

Register BLE Mesh Config Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **callback**: Pointer to the callback function.
esp_err_t esp_ble_mesh_register_config_server_callback (esp_ble_mesh_cfg_server_cb_t callback)

Register BLE Mesh Config Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

• callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_config_client_get_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_get_state_t *get_state)

Get the value of Config Server Model states using the Config Client Model get messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_get_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

• params: Pointer to BLE Mesh common client parameters.
• get_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

esp_err_t esp_ble_mesh_config_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_set_state_t *set_state)

Set the value of the Configuration Server Model states using the Config Client Model set messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_set_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

• params: Pointer to BLE Mesh common client parameters.
• set_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Unions

union esp_ble_mesh_cfg_client_get_state_t

Configuration Server Model context

2.1. Bluetooth API
Public Members

`esp_ble_mesh_model_t *model`
Pointer to Configuration Server Model

`uint8_t net_transmit`
Network Transmit state

`uint8_t relay`
Relay Mode state

`uint8_t relay_retransmit`
Relay Retransmit state

`uint8_t beacon`
Secure Network Beacon state

`uint8_t gatt_proxy`
GATT Proxy state

`uint8_t friend_state`
Friend state

`uint8_t default_ttl`
Default TTL

`struct k_delayed_work timer`
Heartbeat Publication timer

`uint16_t dst`
Destination address for Heartbeat messages

`uint16_t count`
Number of Heartbeat messages to be sent
Number of Heartbeat messages received

`uint8_t period`
Period for sending Heartbeat messages

`uint8_t ttl`
TTL to be used when sending Heartbeat messages

`uint16_t feature`
Bit field indicating features that trigger Heartbeat messages when changed

`uint16_t net_idx`
NetKey Index used by Heartbeat Publication

`struct esp_ble_mesh_cfg_srv::[anonymous] heartbeat_pub`
Heartbeat Publication

`int64_t expiry`
Timestamp when Heartbeat subscription period is expired

`uint16_t src`
Source address for Heartbeat messages

`uint8_t min_hops`
Minimum hops when receiving Heartbeat messages

`uint8_t max_hops`
Maximum hops when receiving Heartbeat messages
Optional heartbeat subscription tracking function

Heartbeat Subscription

Parameters of Config Composition Data Get.

Public Members

uint8_t page
Page number of the Composition Data.

Parameters of Config Model Publication Get.

Public Members

uint16_t element_addr
The element address
uint16_t model_id
The model id
uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

Parameters of Config SIG Model Subscription Get.

Public Members

uint16_t element_addr
The element address
uint16_t model_id
The model id
uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

Parameters of Config Vendor Model Subscription Get.

Public Members

uint16_t element_addr
The element address
uint16_t model_id
The model id

Parameters of Config AppKey Get.

2.1. Bluetooth API
Public Members

```c
uint16_t net_idx
The network key index
```

**struct esp_ble_mesh_cfg_node_identity_get_t**
Parameters of Config Node Identity Get.

Public Members

```c
uint16_t net_idx
The network key index
```

**struct esp_ble_mesh_cfg_sig_model_app_get_t**
Parameters of Config SIG Model App Get.

Public Members

```c
uint16_t element_addr
The element address
uint16_t model_id
The model id
```

**struct esp_ble_mesh_cfg_vnd_model_app_get_t**
Parameters of Config Vendor Model App Get.

Public Members

uint16_t element_addr
The element address
uint16_t model_id
The model id
uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF
```

**struct esp_ble_mesh_cfg_kr_phase_get_t**
Parameters of Config Key Refresh Phase Get.

Public Members

```c
uint16_t net_idx
The network key index
```

**struct esp_ble_mesh_cfg_lpn_polltimeout_get_t**
Parameters of Config Low Power Node PollTimeout Get.

Public Members

```c
uint16_t lpn_addr
The unicast address of the Low Power node
```
struct esp_ble_mesh_cfg_beacon_set_t
Parameters of Config Beacon Set.

Public Members

uint8_t beacon
New Secure Network Beacon state

struct esp_ble_mesh_cfg_default_ttl_set_t
Parameters of Config Default TTL Set.

Public Members

uint8_t ttl
The default TTL state value

struct esp_ble_mesh_cfg_friend_set_t
Parameters of Config Friend Set.

Public Members

uint8_t friend_state
The friend state value

struct esp_ble_mesh_cfg_gatt_proxy_set_t
Parameters of Config GATT Proxy Set.

Public Members

uint8_t gatt_proxy
The GATT Proxy state value

struct esp_ble_mesh_cfg_relay_set_t
Parameters of Config Relay Set.

Public Members

uint8_t relay
The relay value
uint8_t relay_retransmit
The relay retransmit value

struct esp_ble_mesh_cfg_net_key_add_t
Parameters of Config NetKey Add.

Public Members

uint16_t net_idx
The network key index
uint8_t net_key[16]
The network key value

2.1. Bluetooth API
struct esp_ble_mesh_cfg_app_key_add_t
Parameters of Config AppKey Add.

Public Members

uint16_t net_idx
The network key index

uint16_t app_idx
The app key index

uint8_t [16] app_key
The app key value

struct esp_ble_mesh_cfg_model_app_bind_t
Parameters of Config Model App Bind.

Public Members

uint16_t element_addr
The element address

uint16_t model_app_idx
Index of the app key to bind with the model

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_set_t
Parameters of Config Model Publication Set.

Public Members

uint16_t element_addr
The element address

uint16_t publish_addr
Value of the publish address

uint16_t publish_app_idx
Index of the application key

bool cred_flag
Value of the Friendship Credential Flag

uint8_t publish_ttl
Default TTL value for the publishing messages

uint8_t publish_period
Period for periodic status publishing

uint8_t publish_retransmit
Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t model_id
The model id
uint16_t **company_id**
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_sub_add_t**
Parameters of Config Model Subscription Add.

**Public Members**

- **uint16_t element_addr**
  The element address
- **uint16_t sub_addr**
  The address to be added to the Subscription List
- **uint16_t model_id**
  The model id
- **uint16_t company_id**
  The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_sub_delete_t**
Parameters of Config Model Subscription Delete.

**Public Members**

- **uint16_t element_addr**
  The element address
- **uint16_t sub_addr**
  The address to be removed from the Subscription List
- **uint16_t model_id**
  The model id
- **uint16_t company_id**
  The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_sub_overwrite_t**
Parameters of Config Model Subscription Overwrite.

**Public Members**

- **uint16_t element_addr**
  The element address
- **uint16_t sub_addr**
  The address to be added to the Subscription List
- **uint16_t model_id**
  The model id
- **uint16_t company_id**
  The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_sub_va_add_t**
Parameters of Config Model Subscription Virtual Address Add.
Public Members

uint16_t element_addr
The element address

uint8_t label_uuid[16]
The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_delete_t
Parameters of Config Model Subscription Virtual Address Delete.

Public Members

uint16_t element_addr
The element address

uint8_t label_uuid[16]
The Label UUID of the virtual address to be removed from the Subscription List

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_overwrite_t
Parameters of Config Model Subscription Virtual Address Overwrite.

Public Members

uint16_t element_addr
The element address

uint8_t label_uuid[16]
The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_va_set_t
Parameters of Config Model Publication Virtual Address Set.

Public Members

uint16_t element_addr
The element address

uint8_t label_uuid[16]
Value of the Label UUID publish address

uint16_t publish_app_idx
   Index of the application key

bool cred_flag
   Value of the Friendship Credential Flag

uint8_t publish_ttl
   Default TTL value for the publishing messages

uint8_t publish_period
   Period for periodic status publishing

uint8_t publish_retransmit
   Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_all_t
   Parameters of Config Model Subscription Delete All.

Public Members

uint16_t element_addr
   The element address

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_net_key_update_t
   Parameters of Config NetKey Update.

Public Members

uint16_t net_idx
   The network key index

uint8_t net_key[16]
   The network key value

struct esp_ble_mesh_cfg_net_key_delete_t
   Parameters of Config NetKey Delete.

Public Members

uint16_t net_idx
   The network key index

struct esp_ble_mesh_cfg_app_key_update_t
   Parameters of Config AppKey Update.
Public Members

uint16_t net_idx
The network key index

uint16_t app_idx
The app key index

uint8_t app_key[16]
The app key value

struct esp_ble_mesh_cfg_app_key_delete_t
Parameters of Config AppKey Delete.

Public Members

uint16_t net_idx
The network key index

uint16_t app_idx
The app key index

struct esp_ble_mesh_cfg_node_identity_set_t
Parameters of Config Node Identity Set.

Public Members

uint16_t net_idx
The network key index

uint8_t identity
New Node Identity state

struct esp_ble_mesh_cfg_model_app_unbind_t
Parameters of Config Model App Unbind.

Public Members

uint16_t element_addr
The element address

uint16_t model_app_idx
Index of the app key to bind with the model

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_kr_phase_set_t
Parameters of Config Key Refresh Phase Set.
Public Members

`uint16_t net_idx`
The network key index

`uint8_t transition`
New Key Refresh Phase Transition

`struct esp_ble_mesh_cfg_net_transmit_set_t`
Parameters of Config Network Transmit Set.

Public Members

`uint8_t net_transmit`
Network Transmit State

`struct esp_ble_mesh_cfg_heartbeat_pub_set_t`
Parameters of Config Model Heartbeat Publication Set.

Public Members

`uint16_t dst`
Destination address for Heartbeat messages

`uint8_t count`
Number of Heartbeat messages to be sent

`uint8_t period`
Period for sending Heartbeat messages

`uint8_t ttl`
TTL to be used when sending Heartbeat messages

`uint16_t feature`
Bit field indicating features that trigger Heartbeat messages when changed

`uint16_t net_idx`
NetKey Index

`struct esp_ble_mesh_cfg_heartbeat_sub_set_t`
Parameters of Config Model Heartbeat Subscription Set.

Public Members

`uint16_t src`
Source address for Heartbeat messages

`uint16_t dst`
Destination address for Heartbeat messages

`uint8_t period`
Period for receiving Heartbeat messages

`struct esp_ble_mesh_cfg_beacon_status_cb_t`
Parameter of Config Beacon Status
Public Members

uint8_t beacon
Secure Network Beacon state value

struct esp_ble_mesh_cfg_comp_data_status_cb_t
Parameters of Config Composition Data Status

Public Members

uint8_t page
Page number of the Composition Data

struct net_buf_simple *composition_data
Pointer to Composition Data for the identified page

struct esp_ble_mesh_cfg_default_ttl_status_cb_t
Parameter of Config Default TTL Status

Public Members

uint8_t default_ttl
Default TTL state value

struct esp_ble_mesh_cfg_gatt_proxy_status_cb_t
Parameter of Config GATT Proxy Status

Public Members

uint8_t gatt_proxy
GATT Proxy state value

struct esp_ble_mesh_cfg_relay_status_cb_t
Parameters of Config Relay Status

Public Members

uint8_t relay
Relay state value

uint8_t retransmit
Relay retransmit value (number of retransmissions and number of 10-millisecond steps between retransmissions)

struct esp_ble_mesh_cfg_model_pub_status_cb_t
Parameters of Config Model Publication Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element
**Public Members**

`uint8_t status`
Status Code for the request message

`uint16_t element_addr`
Address of the element

`uint16_t sub_addr`
Value of the address

`uint16_t company_id`
Company ID

`uint16_t model_id`
Model ID

**Public Members**

`uint8_t status`
Status Code for the request message

`uint16_t net_idx`
Index of the NetKey

**Public Members**

`uint8_t status`
Status Code for the request message

`uint16_t net_idx`
Index of the NetKey

`struct esp_ble_mesh_cfg_model_sub_status_cb_t` Parameters of Config Model Subscription Status
Public Members

uint8_t status
  Status Code for the request message

uint16_t net_idx
  Index of the NetKey

uint16_t app_idx
  Index of the application key

struct esp_ble_mesh_cfg_mod_app_status_cb_t
  Parameters of Config Model App Status

Public Members

uint8_t status
  Status Code for the request message

uint16_t element_addr
  Address of the element

uint16_t app_idx
  Index of the application key

uint16_t company_id
  Company ID

uint16_t model_id
  Model ID

struct esp_ble_mesh_cfg_friend_status_cb_t
  Parameter of Config Friend Status

Public Members

uint8_t friend_state
  Friend state value

Public Members

uint8_t status
  Status Code for the request message

uint16_t dst
  Destination address for Heartbeat messages

uint8_t count
  Number of Heartbeat messages remaining to be sent

uint8_t period
  Period for sending Heartbeat messages

uint8_t ttl
  TTL to be used when sending Heartbeat messages
uint16_t features
    Features that trigger Heartbeat messages when changed

uint16_t net_idx
    Index of the NetKey

struct esp_ble_mesh_cfg_hb_sub_status_cb_t
    Parameters of Config Heartbeat Subscription Status

Public Members

uint8_t status
    Status Code for the request message

uint16_t src
    Source address for Heartbeat messages

uint16_t dst
    Destination address for Heartbeat messages

uint8_t period
    Remaining Period for processing Heartbeat messages

uint8_t count
    Number of Heartbeat messages received

uint8_t min_hops
    Minimum hops when receiving Heartbeat messages

uint8_t max_hops
    Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_net_trans_status_cb_t
    Parameters of Config Network Transmit Status

Public Members

uint8_t net_trans_count
    Number of transmissions for each Network PDU originating from the node

uint8_t net_trans_step
    Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_model_sub_list_cb_t
    Parameters of Config SIG/Vendor Subscription List

Public Members

uint8_t status
    Status Code for the request message

uint16_t element_addr
    Address of the element

uint16_t company_id
    Company ID

uint16_t model_id
    Model ID

2.1. Bluetooth API

```c
struct net_buf_simple *sub_addr
A block of all addresses from the Subscription List
```

```c
struct esp_ble_mesh_cfg_net_key_list_cb_t
Parameter of Config NetKey List
```

Public Members

```c
struct net_buf_simple *net_idx
A list of NetKey Indexes known to the node
```

```c
struct esp_ble_mesh_cfg_app_key_list_cb_t
Parameters of Config AppKey List
```

Public Members

```c
uint8_t status
Status Code for the request message
```

```c
uint16_t net_idx
NetKey Index of the NetKey that the AppKeys are bound to
```

```c
struct net_buf_simple *app_idx
A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex
```

```c
struct esp_ble_mesh_cfg_node_id_status_cb_t
Parameters of Config Node Identity Status
```

Public Members

```c
uint8_t status
Status Code for the request message
```

```c
uint16_t net_idx
Index of the NetKey
```

```c
uint8_t identity
Node Identity state
```

```c
struct esp_ble_mesh_cfg_model_app_list_cb_t
Parameters of Config SIG/Vendor Model App List
```

Public Members

```c
uint8_t status
Status Code for the request message
```

```c
uint16_t element_addr
Address of the element
```

```c
uint16_t company_id
Company ID
```

```c
uint16_t model_id
Model ID
```
struct net_buf_simple *app_idx
All AppKey indexes bound to the Model

struct esp_ble_mesh_cfg_kr_phase_status_cb_t
Parameters of Config Key Refresh Phase Status

**Public Members**

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

uint8_t phase
Key Refresh Phase state

struct esp_ble_mesh_cfg_lpn_pollto_status_cb_t
Parameters of Config Low Power Node PollTimeout Status

**Public Members**

uint16_t lpn_addr
The unicast address of the Low Power node

int32_t poll_timeout
The current value of the PollTimeout timer of the Low Power node

struct esp_ble_mesh_cfg_client_cb_param_t
Configuration Client Model callback parameters

**Public Members**

int error_code
Appropriate error code

* esp_ble_mesh_client_common_param_t *params
The client common parameters

* esp_ble_mesh_cfg_client_common_cb_param_t *status_cb
The config status message callback values

struct esp_ble_mesh_state_change_cfg_mod_pub_set_t
Configuration Server model related context.

**Public Members**

uint16_t element_addr
Element Address

uint16_t pub_addr
Publish Address

uint16_t app_idx
AppKey Index
bool cred_flag
   Friendship Credential Flag

t uint8_t pub_ttl
   Publish TTL

t uint8_t pub_period
   Publish Period

t uint8_t pub_retransmit
   Publish Retransmit

t uint16_t company_id
   Company ID

t uint16_t model_id
   Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_add_t
   Parameters of Config Model Subscription Add

Public Members

uint16_t element_addr
   Element Address

uint16_t sub_addr
   Subscription Address

uint16_t company_id
   Company ID

uint16_t model_id
   Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_delete_t
   Parameters of Config Model Subscription Delete

Public Members

uint16_t element_addr
   Element Address

uint16_t sub_addr
   Subscription Address

uint16_t company_id
   Company ID

uint16_t model_id
   Model ID

struct esp_ble_mesh_state_change_cfg_netkey_add_t
   Parameters of Config NetKey Add

Public Members

uint16_t net_idx
   NetKey Index

```c
uint8_t net_key[16]
NetKey

struct esp_ble_mesh_state_change_cfg_netkey_update_t
Parameters of Config NetKey Update

Public Members

uint16_t net_idx
NetKey Index
uint8_t net_key[16]
NetKey

struct esp_ble_mesh_state_change_cfg_netkey_delete_t
Parameter of Config NetKey Delete

Public Members

uint16_t net_idx
NetKey Index

struct esp_ble_mesh_state_change_cfg_appkey_add_t
Parameters of Config AppKey Add

Public Members

uint16_t net_idx
NetKey Index
uint16_t app_idx
AppKey Index
uint8_t app_key[16]
AppKey

struct esp_ble_mesh_state_change_cfg_appkey_update_t
Parameters of Config AppKey Update

Public Members

uint16_t net_idx
NetKey Index
uint16_t app_idx
AppKey Index
uint8_t app_key[16]
AppKey

struct esp_ble_mesh_state_change_cfg_appkey_delete_t
Parameters of Config AppKey Delete
```
Public Members

uint16_t net_idx
   NetKey Index

uint16_t app_idx
   AppKey Index

struct esp_ble_mesh_state_change_cfg_model_app_bind_t
   Parameters of Config Model App Bind

Public Members

uint16_t element_addr
   Element Address

uint16_t app_idx
   AppKey Index

uint16_t company_id
   Company ID

uint16_t model_id
   Model ID

struct esp_ble_mesh_state_change_cfg_model_app_unbind_t
   Parameters of Config Model App Unbind

Public Members

uint16_t element_addr
   Element Address

uint16_t app_idx
   AppKey Index

uint16_t company_id
   Company ID

uint16_t model_id
   Model ID

struct esp_ble_mesh_state_change_cfg_kr_phase_set_t
   Parameters of Config Key Refresh Phase Set

Public Members

uint16_t net_idx
   NetKey Index

uint8_t kr_phase
   New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_server_cb_param_t
   Configuration Server model callback parameters
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the server model structure

`esp_ble_mesh_msg_ctx_t ctx`
Context of the received message

`esp_ble_mesh_cfg_server_cb_value_t value`
Value of the received configuration messages

Macros

**ESP_BLE_MESH_MODEL_CFG_SRV** (srv_data)
Define a new Config Server Model.

**Note** The Config Server Model can only be included by a Primary Element.

**Return** New Config Server Model instance.

**Parameters**

- `srv_data`: Pointer to a unique Config Server Model user_data.

**ESP_BLE_MESH_MODEL_CFG_CLI** (cli_data)
Define a new Config Client Model.

**Note** The Config Client Model can only be included by a Primary Element.

**Return** New Config Client Model instance.

**Parameters**

- `cli_data`: Pointer to a unique struct `esp_ble_mesh_client_t`.

Type Definitions

```c
typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t
Configuration Server Model context
```

```c
typedef void (*esp_ble_mesh_cfg_client_cb_t)
(event,
esp_ble_mesh_cfg_client_cb_param_t *param)
```
Configuration Client Model callback function type

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_cfg_server_cb_t)
(event,
esp_ble_mesh_cfg_server_cb_param_t *param)
```
Configuration Server Model callback function type

**Parameters**
• **event**: Event type
  *param*: Pointer to callback parameter

### Enumerations

```python
define enum esp_ble_mesh_cfg_client_cb_event_t

This enum value is the event of Configuration Client Model

**Values:**

- ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT
- ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT
- ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT
- ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT
- ESP_BLE_MESH_CFG_CLIENT_EVT_MAX

```python
define enum esp_ble_mesh_cfg_server_cb_event_t

This enum value is the event of Configuration Server model

**Values:**

- ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT
- ESP_BLE_MESH_CFG_SERVER_EVT_MAX

```python

### Health Client/Server Models

### Header File

- bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h

### Functions

```python
define esp_err_t esp_ble_mesh_register_generic_client_callback(esp_ble_mesh_generic_client_cb_t callback)

Register BLE Mesh Generic Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- *callback*: Pointer to the callback function.

```python
define esp_err_t esp_ble_mesh_generic_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_generic_client_get_state_t *get_state)

Get the value of Generic Server Model states using the Generic Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**
• **params**: Pointer to BLE Mesh common client parameters.
• **get_state**: Pointer to generic get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_generic_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_generic_client_set_state_t *set_state)
```

Set the value of Generic Server Model states using the Generic Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP_OK on success or error code otherwise.

**Parameters**
• **params**: Pointer to BLE Mesh common client parameters.
• **set_state**: Pointer to generic set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_generic_server_callback(esp_ble_mesh_generic_server_cb_t callback)
```

Register BLE Mesh Generic Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
• **callback**: Pointer to the callback function.

### Unions

**union esp_ble_mesh_generic_client_get_state_t**

> `#include <esp_ble_mesh_generic_model_api.h>` Generic Client Model get message union.

**Public Members**

  Generic Manufacturer Property Set

union esp_ble_mesh_generic_server_recv_get_msg_t
#include <esp_ble_mesh_generic_model_api.h> Generic Server Model received get message union.

Public Members

esp_ble_mesh_server_recv_gen_user_property_get_t user_property
  Generic User Property Get

esp_ble_mesh_server_recv_gen_admin_property_get_t admin_property
  Generic Admin Property Get

esp_ble_mesh_server_recv_gen_manufacturer_property_get_t manu_property
  Generic Manufacturer Property Get

esp_ble_mesh_server_recv_gen_client_properties_get_t client_properties
  Generic Client Properties Get

union esp_ble_mesh_generic_server_recv_set_msg_t
#include <esp_ble_mesh_generic_model_api.h> Generic Server Model received set message union.

Public Members

esp_ble_mesh_server_recv_gen_onoff_set_t onoff
  Generic OnOff Set/Generic OnOff Set Unack

esp_ble_mesh_server_recv_gen_level_set_t level
  Generic Level Set/Generic Level Set Unack

esp_ble_mesh_server_recv_gen_delta_set_t delta
  Generic Delta Set/Generic Delta Set Unack
union esp_ble_mesh_generic_server_cb_value_t
#include <esp_ble_mesh_generic_model_api.h> Generic Server Model callback value union.

Public Members

esp_ble_mesh_server_recv_gen_move_set_t move
Generic Move Set/Generic Move Set Unack

esp_ble_mesh_server_recv_gen_def_trans_time_set_t def_trans_time
Generic Default Transition Time Set/Generic Default Transition Time Set Unack

esp_ble_mesh_server_recv_gen_onpowerup_set_t onpowerup
Generic OnPowerUp Set/Generic OnPowerUp Set Unack

esp_ble_mesh_server_recv_gen_power_level_set_t power_level
Generic Power Level Set/Generic Power Level Set Unack

esp_ble_mesh_server_recv_gen_power_default_set_t power_default
Generic Power Default Set/Generic Power Default Set Unack

esp_ble_mesh_server_recv_gen_power_range_set_t power_range
Generic Power Range Set/Generic Power Range Set Unack

esp_ble_mesh_server_recv_gen_loc_global_set_t location_global
Generic Location Global Set/Generic Location Global Set Unack

esp_ble_mesh_server_recv_gen_loc_local_set_t location_local
Generic Location Local Set/Generic Location Local Set Unack

esp_ble_mesh_server_recv_gen_user_property_set_t user_property
Generic User Property Set/Generic User Property Set Unack

esp_ble_mesh_server_recv_gen_admin_property_set_t admin_property
Generic Admin Property Set/Generic Admin Property Set Unack

esp_ble_mesh_server_recv_gen_manufacturer_property_set_t manu_property
Generic Manufacturer Property Set/Generic Manufacturer Property Set Unack

Structures

struct esp_ble_mesh_gen_onoff_set_t
Bluetooth Mesh Generic Client Model Get and Set parameters structure.
Parameters of Generic OnOff Set.

Public Members

bool op_en
Indicate if optional parameters are included
uint8_t \_onoff
Target value of Generic OnOff state

uint8_t \_tid
Transaction ID

uint8_t \_trans\_time
Time to complete state transition (optional)

uint8_t \_delay
Indicate message execution delay (C.1)

struct esp\_ble\_mesh\_gen\_level\_set\_t
Parameters of Generic Level Set.

**Public Members**

bool \_op\_en
Indicate if optional parameters are included

int16_t \_level
Target value of Generic Level state

uint8_t \_tid
Transaction ID

uint8_t \_trans\_time
Time to complete state transition (optional)

uint8_t \_delay
Indicate message execution delay (C.1)

struct esp\_ble\_mesh\_gen\_delta\_set\_t
Parameters of Generic Delta Set.

**Public Members**

bool \_op\_en
Indicate if optional parameters are included

int32_t \_level
Delta change of Generic Level state

uint8_t \_tid
Transaction ID

uint8_t \_trans\_time
Time to complete state transition (optional)

uint8_t \_delay
Indicate message execution delay (C.1)

struct esp\_ble\_mesh\_gen\_move\_set\_t
Parameters of Generic Move Set.

**Public Members**

bool \_op\_en
Indicate if optional parameters are included
int16_t \texttt{delta\_level}
Delta Level step to calculate Move speed for Generic Level state

uint8_t \texttt{tid}
Transaction ID

uint8_t \texttt{trans\_time}
Time to complete state transition (optional)

uint8_t \texttt{delay}
Indicate message execution delay (C.1)

\begin{verbatim}
struct esp_ble_mesh_gen_def_trans_time_set_t
Parameter of Generic Default Transition Time Set.
\end{verbatim}

\textbf{Public Members}

uint8_t \texttt{trans\_time}
The value of the Generic Default Transition Time state

\begin{verbatim}
struct esp_ble_mesh_gen_onpowerup_set_t
Parameter of Generic OnPowerUp Set.
\end{verbatim}

\textbf{Public Members}

uint8_t \texttt{onpowerup}
The value of the Generic OnPowerUp state

\begin{verbatim}
struct esp_ble_mesh_gen_power_level_set_t
Parameters of Generic Power Level Set.
\end{verbatim}

\textbf{Public Members}

bool \texttt{op\_en}
Indicate if optional parameters are included

uint16_t \texttt{power}
Target value of Generic Power Actual state

uint8_t \texttt{tid}
Transaction ID

uint8_t \texttt{trans\_time}
Time to complete state transition (optional)

uint8_t \texttt{delay}
Indicate message execution delay (C.1)

\begin{verbatim}
struct esp_ble_mesh_gen_power_default_set_t
Parameter of Generic Power Default Set.
\end{verbatim}

\textbf{Public Members}

uint16_t \texttt{power}
The value of the Generic Power Default state
struct esp_ble_mesh_gen_power_range_set_t
Parameters of Generic Power Range Set.

**Public Members**

- `uint16_t range_min`
  Value of Range Min field of Generic Power Range state

- `uint16_t range_max`
  Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_gen_loc_global_set_t
Parameters of Generic Location Global Set.

**Public Members**

- `int32_t global_latitude`
  Global Coordinates (Latitude)

- `int32_t global_longitude`
  Global Coordinates (Longitude)

- `int16_t global_altitude`
  Global Altitude

struct esp_ble_mesh_gen_loc_local_set_t
Parameters of Generic Location Local Set.

**Public Members**

- `int16_t local_north`
  Local Coordinates (North)

- `int16_t local_east`
  Local Coordinates (East)

- `int16_t local_altitude`
  Local Altitude

- `uint8_t floor_number`
  Floor Number

- `uint16_t uncertainty`
  Uncertainty

struct esp_ble_mesh_gen_user_property_get_t
Parameter of Generic User Property Get.

**Public Members**

- `uint16_t property_id`
  Property ID identifying a Generic User Property

struct esp_ble_mesh_gen_user_property_set_t
Parameters of Generic User Property Set.
**Public Members**

```c
uint16_t property_id
  Property ID identifying a Generic User Property
```

```c
struct net_buf_simple *property_value
  Raw value for the User Property
```

**struct esp_ble_mesh_gen_admin_property_get_t**
Parameter of Generic Admin Property Get.

**Public Members**

```c
uint16_t property_id
  Property ID identifying a Generic Admin Property
```

```c
struct esp_ble_mesh_gen_admin_property_set_t
  Parameters of Generic Admin Property Set.
```

**Public Members**

```c
uint16_t property_id
  Property ID identifying a Generic Admin Property
```

```c
uint8_t user_access
  Enumeration indicating user access
```

```c
struct net_buf_simple *property_value
  Raw value for the Admin Property
```

**struct esp_ble_mesh_gen_manufacturer_property_get_t**
Parameter of Generic Manufacturer Property Get.

**Public Members**

```c
uint16_t property_id
  Property ID identifying a Generic Manufacturer Property
```

**struct esp_ble_mesh_gen_manufacturer_property_set_t**
Parameters of Generic Manufacturer Property Set.

**Public Members**

```c
uint16_t property_id
  Property ID identifying a Generic Manufacturer Property
```

```c
uint8_t user_access
  Enumeration indicating user access
```

```c
struct esp_ble_mesh_gen_client_properties_get_t
  Parameter of Generic Client Properties Get.
```

2.1. Bluetooth API
Public Members

`uint16_t property_id`
A starting Client Property ID present within an element

`struct esp_ble_mesh_gen_onoff_status_cb_t`
Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.
Parameters of Generic OnOff Status.

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint8_t present_onoff`
Current value of Generic OnOff state

`uint8_t target_onoff`
Target value of Generic OnOff state (optional)

`uint8_t remain_time`
Time to complete state transition (C.1)

`struct esp_ble_mesh_gen_level_status_cb_t`
Parameters of Generic Level Status.

Public Members

`bool op_en`
Indicate if optional parameters are included

`int16_t present_level`
Current value of Generic Level state

`int16_t target_level`
Target value of the Generic Level state (optional)

`uint8_t remain_time`
Time to complete state transition (C.1)

`struct esp_ble_mesh_gen_def_trans_time_status_cb_t`
Parameter of Generic Default Transition Time Status.

Public Members

`uint8_t trans_time`
The value of the Generic Default Transition Time state

`struct esp_ble_mesh_gen_onpowerup_status_cb_t`

Public Members

`uint8_t onpowerup`
The value of the Generic OnPowerUp state
struct esp_ble_mesh_gen_power_level_status_cb_t
Parameters of Generic Power Level Status.

Public Members

bool op_en
  Indicate if optional parameters are included

uint16_t present_power
  Current value of Generic Power Actual state

uint16_t target_power
  Target value of Generic Power Actual state (optional)

uint8_t remain_time
  Time to complete state transition (C.1)

struct esp_ble_mesh_gen_power_last_status_cb_t
Parameter of Generic Power Last Status.

Public Members

uint16_t power
  The value of the Generic Power Last state

struct esp_ble_mesh_gen_power_default_status_cb_t
Parameter of Generic Power Default Status.

Public Members

uint16_t power
  The value of the Generic Default Last state

struct esp_ble_mesh_gen_power_range_status_cb_t
Parameters of Generic Power Range Status.

Public Members

uint8_t status_code
  Status Code for the request message

uint16_t range_min
  Value of Range Min field of Generic Power Range state

uint16_t range_max
  Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_gen_battery_status_cb_t
Parameters of Generic Battery Status.

Public Members

u32_t battery_level
  Value of Generic Battery Level state

2.1. Bluetooth API

```

u32_t time_to_discharge
    Value of Generic Battery Time to Discharge state

u32_t time_to_charge
    Value of Generic Battery Time to Charge state

u32_t flags
    Value of Generic Battery Flags state

struct esp_ble_mesh_gen_loc_global_status_cb_t
    Parameters of Generic Location Global Status.

Public Members

int32_t global_latitude
    Global Coordinates (Latitude)

int32_t global_longitude
    Global Coordinates (Longitude)

int16_t global_altitude
    Global Altitude

struct esp_ble_mesh_gen_loc_local_status_cb_t
    Parameters of Generic Location Local Status.

Public Members

int16_t local_north
    Local Coordinates (North)

int16_t local_east
    Local Coordinates (East)

int16_t local_altitude
    Local Altitude

uint8_t floor_number
    Floor Number

uint16_t uncertainty
    Uncertainty

struct esp_ble_mesh_gen_user_properties_status_cb_t
    Parameter of Generic User Properties Status.

Public Members

struct net_buf_simple *property_ids
    Buffer contains a sequence of N User Property IDs

struct esp_ble_mesh_gen_user_property_status_cb_t
    Parameters of Generic User Property Status.
```
Public Members

bool op_en
  Indicate if optional parameters are included

uint16_t property_id
  Property ID identifying a Generic User Property

uint8_t user_access
  Enumeration indicating user access (optional)

struct net_buf_simple *property_value
  Raw value for the User Property (C.1)

struct esp_ble_mesh_gen_admin_properties_status_cb_t
  Parameter of Generic Admin Properties Status.

Public Members

struct net_buf_simple *property_ids
  Buffer contains a sequence of N Admin Property IDs

struct esp_ble_mesh_gen_admin_property_status_cb_t
  Parameters of Generic Admin Property Status.

Public Members

bool op_en
  Indicate if optional parameters are included

uint16_t property_id
  Property ID identifying a Generic Admin Property

uint8_t user_access
  Enumeration indicating user access (optional)

struct net_buf_simple *property_value
  Raw value for the Admin Property (C.1)

struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t
  Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple *property_ids
  Buffer contains a sequence of N Manufacturer Property IDs

struct esp_ble_mesh_gen_manufacturer_property_status_cb_t
  Parameters of Generic Manufacturer Property Status.

Public Members

bool op_en
  Indicate if optional parameters are included

uint16_t property_id
  Property ID identifying a Generic Manufacturer Property
uint8_t user_access
    Enumeration indicating user access (optional)

struct net_buf_simple *property_value
    Raw value for the Manufacturer Property (C.1)

struct esp_ble_mesh_gen_client_properties_status_cb_t
    Parameter of Generic Client Properties Status.

Public Members

struct net_buf_simple *property_ids
    Buffer contains a sequence of N Client Property IDs

struct esp_ble_mesh_generic_client_cb_param_t
    Generic Client Model callback parameters

Public Members

int error_code
    Appropriate error code

esp_ble_mesh_client_common_param_t *params
    The client common parameters.

esp_ble_mesh_gen_client_status_cb_t status_cb
    The generic status message callback values

struct esp_ble_mesh_gen_onoff_state_t
    Parameters of Generic OnOff state

Public Members

uint8_t onoff
    The present value of the Generic OnOff state

uint8_t target_onoff
    The target value of the Generic OnOff state

struct esp_ble_mesh_gen_onoff_srv_t
    User data of Generic OnOff Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Generic OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_gen_onoff_state_t state
    Parameters of the Generic OnOff state

esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

```c

esp_ble_mesh_state_transition_t transition
Parameters of state transition

struct esp_ble_mesh_gen_level_state_t
Parameters of Generic Level state

Public Members

int16_t level
The present value of the Generic Level state

int16_t target_level
The target value of the Generic Level state

int16_t last_level
When a new transaction starts, level should be set to last_last, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

int32_t last_delta
The last delta change of the Generic Level state

bool move_start
Indicate if the transition of the Generic Level state has been started

bool positive
Indicate if the transition is positive or negative

struct esp_ble_mesh_gen_level_srv_t
User data of Generic Level Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_level_state_t state
Parameters of the Generic Level state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
Parameters of state transition

int32_t tt_delta_level
Delta change value of level state transition

struct esp_ble_mesh_gen_def_trans_time_state_t
Parameter of Generic Default Transition Time state
```

2.1. Bluetooth API
Public Members

```c
uint8_t trans_time
The value of the Generic Default Transition Time state
```

```c
struct esp_ble_mesh_gen_def_trans_time_srv_t
User data of Generic Default Transition Time Server Model
```

Public Members

```c
esp_ble_mesh_model_t *model
Pointer to the Generic Default Transition Time Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages
```

```c
esp_ble_mesh_gen_def_trans_time_state_t state
Parameters of the Generic Default Transition Time state
```

```c
struct esp_ble_mesh_gen_onpowerup_state_t
Parameter of Generic OnPowerUp state
```

Public Members

```c
uint8_t onpowerup
The value of the Generic OnPowerUp state
```

```c
struct esp_ble_mesh_gen_power_onoff_srv_t
User data of Generic Power OnOff Server Model
```

Public Members

```c
esp_ble_mesh_model_t *model
Pointer to the Generic Power OnOff Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages
```

```c
esp_ble_mesh_gen_onpowerup_state_t *state
Parameters of the Generic OnPowerUp state
```

```c
struct esp_ble_mesh_gen_power_onoff_setup_srv_t
User data of Generic Power OnOff Setup Server Model
```

Public Members

```c
esp_ble_mesh_model_t *model
Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages
```

```c
esp_ble_mesh_gen_onpowerup_state_t *state
Parameters of the Generic OnPowerUp state
```

```c
struct esp_ble_mesh_gen_power_level_state_t
Parameters of Generic Power Level state
```
Public Members

uint16_t **power_actual**
The present value of the Generic Power Actual state

uint16_t **target_power_actual**
The target value of the Generic Power Actual state

uint16_t **power_last**
The value of the Generic Power Last state

uint16_t **power_default**
The value of the Generic Power Default state

uint8_t **status_code**
The status code of setting Generic Power Range state

uint16_t **power_range_min**
The minimum value of the Generic Power Range state

uint16_t **power_range_max**
The maximum value of the Generic Power Range state

struct esp_ble_mesh_gen_power_level_srv_t
User data of Generic Power Level Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Power Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**
Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t *state
Parameters of the Generic Power Level state

esp_ble_mesh_last_msg_info_t **last**
Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**
Parameters of state transition

int32_t **tt_delta_level**
Delta change value of level state transition

struct esp_ble_mesh_gen_power_level_setup_srv_t
User data of Generic Power Level Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Power Level Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**
Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t *state
Parameters of the Generic Power Level state

2.1. Bluetooth API
struct esp_ble_mesh_gen_battery_state_t
Parameters of Generic Battery state

**Public Members**

uint32_t **battery_level**
The value of the Generic Battery Level state

uint32_t **time_to_discharge**
The value of the Generic Battery Time to Discharge state

uint32_t **time_to_charge**
The value of the Generic Battery Time to Charge state

uint32_t **battery_flags**
The value of the Generic Battery Flags state

struct esp_ble_mesh_gen_battery_srv_t
User data of Generic Battery Server Model

**Public Members**

* esp_ble_mesh_model_t **model**
Pointer to the Generic Battery Server Model. Initialized internally.

* esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**
Response control of the server model received messages

* esp_ble_mesh_gen_battery_state_t **state**
Parameters of the Generic Battery state

struct esp_ble_mesh_gen_location_state_t
Parameters of Generic Location state

**Public Members**

int32_t **global_latitude**
The value of the Global Latitude field

int32_t **global_longitude**
The value of the Global Longitude field

int16_t **global_altitude**
The value of the Global Altitude field

int16_t **local_north**
The value of the Local North field

int16_t **local_east**
The value of the Local East field

int16_t **local_altitude**
The value of the Local Altitude field

uint8_t **floor_number**
The value of the Floor Number field

uint16_t **uncertainty**
The value of the Uncertainty field
struct esp_ble_mesh_gen_location_srv_t
User data of Generic Location Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Location Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_location_state_t *state
Parameters of the Generic Location state

struct esp_ble_mesh_gen_location_setup_srv_t
User data of Generic Location Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Location Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_location_state_t *state
Parameters of the Generic Location state

struct esp_ble_mesh_generic_property_t
Parameters of Generic Property states

Public Members

uint16_t id
The value of User/Admin/Manufacturer Property ID

uint8_t user_access
The value of User Access field

uint8_t admin_access
The value of Admin Access field

uint8_t manu_access
The value of Manufacturer Access field

struct net_buf_simple *val
The value of User/Admin/Manufacturer Property

struct esp_ble_mesh_gen_user_prop_srv_t
User data of Generic User Property Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic User Property Server Model. Initialized internally.

2.1. Bluetooth API
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

uint8_t property_count
Generic User Property count

esp_ble_mesh_generic_property_t **properties
Parameters of the Generic User Property state

struct esp_ble_mesh_gen_admin_prop_srv_t
User data of Generic Admin Property Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Admin Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

uint8_t property_count
Generic Admin Property count

esp_ble_mesh_generic_property_t **properties
Parameters of the Generic Admin Property state

struct esp_ble_mesh_gen_manu_prop_srv_t
User data of Generic Manufacturer Property Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

uint8_t property_count
Generic Manufacturer Property count

esp_ble_mesh_generic_property_t **properties
Parameters of the Generic Manufacturer Property state

struct esp_ble_mesh_gen_client_prop_srv_t
User data of Generic Client Property Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Client Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

uint8_t id_count
Generic Client Property ID count

uint16_t *property_ids
Parameters of the Generic Client Property state
struct esp_ble_mesh_state_change_gen_onoff_set_t
Parameter of Generic OnOff Set state change event

Public Members

uint8_t onoff
The value of Generic OnOff state

struct esp_ble_mesh_state_change_gen_level_set_t
Parameter of Generic Level Set state change event

Public Members

int16_t level
The value of Generic Level state

struct esp_ble_mesh_state_change_gen_delta_set_t
Parameter of Generic Delta Set state change event

Public Members

int16_t level
The value of Generic Level state

struct esp_ble_mesh_state_change_gen_move_set_t
Parameter of Generic Move Set state change event

Public Members

int16_t level
The value of Generic Level state

struct esp_ble_mesh_state_change_gen_def_trans_time_set_t
Parameter of Generic Default Transition Time Set state change event

Public Members

uint8_t trans_time
The value of Generic Default Transition Time state

struct esp_ble_mesh_state_change_gen_onpowerup_set_t
Parameter of Generic OnPowerUp Set state change event

Public Members

uint8_t onpowerup
The value of Generic OnPowerUp state

struct esp_ble_mesh_state_change_gen_power_level_set_t
Parameter of Generic Power Level Set state change event

Public Members

uint8_t powerlevel
The value of Generic Power Level state
Public Members

**uint16_t** power
The value of Generic Power Actual state

**struct esp_ble_mesh_state_change_gen_power_default_set_t**
Parameter of Generic Power Default Set state change event

Public Members

**uint16_t** power
The value of Generic Power Default state

**struct esp_ble_mesh_state_change_gen_power_range_set_t**
Parameters of Generic Power Range Set state change event

Public Members

**uint16_t** range_min
The minimum value of Generic Power Range state

**uint16_t** range_max
The maximum value of Generic Power Range state

**struct esp_ble_mesh_state_change_gen_loc_global_set_t**
Parameters of Generic Location Global Set state change event

Public Members

**int32_t** latitude
The Global Latitude value of Generic Location state

**int32_t** longitude
The Global Longitude value of Generic Location state

**int16_t** altitude
The Global Altitude value of Generic Location state

**struct esp_ble_mesh_state_change_gen_loc_local_set_t**
Parameters of Generic Location Local Set state change event

Public Members

**int16_t** north
The Local North value of Generic Location state

**int16_t** east
The Local East value of Generic Location state

**int16_t** altitude
The Local Altitude value of Generic Location state

**uint8_t** floor_number
The Floor Number value of Generic Location state

**uint16_t** uncertainty
The Uncertainty value of Generic Location state
struct esp_ble_mesh_state_change_gen_user_property_set_t
Parameters of Generic User Property Set state change event

Public Members

uint16_t id
The property id of Generic User Property state

struct net_buf_simple *value
The property value of Generic User Property state

struct esp_ble_mesh_state_change_gen_admin_property_set_t
Parameters of Generic Admin Property Set state change event

Public Members

uint16_t id
The property id of Generic Admin Property state

uint8_t access
The property access of Generic Admin Property state

struct net_buf_simple *value
The property value of Generic Admin Property state

struct esp_ble_mesh_state_change_gen_manu_property_set_t
Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t id
The property id of Generic Manufacturer Property state

uint8_t access
The property value of Generic Manufacturer Property state

struct esp_ble_mesh_server_recv_gen_user_property_get_t
Context of the received Generic User Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct esp_ble_mesh_server_recv_gen_admin_property_get_t
Context of the received Generic Admin Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_get_t
Context of the received Generic Manufacturer Property message

2.1. Bluetooth API
Public Members

uint16_t **property_id**  
Property ID identifying a Generic Manufacturer Property

**struct esp_ble_mesh_server_recv_gen_client_properties_get_t**  
Context of the received Generic Client Properties Get message

Public Members

uint16_t **property_id**  
A starting Client Property ID present within an element

**struct esp_ble_mesh_server_recv_gen_onoff_set_t**  
Context of the received Generic OnOff Set message

Public Members

bool **op_en**  
Indicate if optional parameters are included

uint8_t **onoff**  
Target value of Generic OnOff state

uint8_t **tid**  
Transaction ID

uint8_t **trans_time**  
Time to complete state transition (optional)

uint8_t **delay**  
Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_gen_level_set_t**  
Context of the received Generic Level Set message

Public Members

bool **op_en**  
Indicate if optional parameters are included

int16_t **level**  
Target value of Generic Level state

uint8_t **tid**  
Transaction ID

uint8_t **trans_time**  
Time to complete state transition (optional)

uint8_t **delay**  
Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_gen_delta_set_t**  
Context of the received Generic Delta Set message
### Public Members

bool **op_en**
Indicate if optional parameters are included

int32_t **delta_level**
Delta change of Generic Level state

uint8_t **tid**
Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t **delay**
Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_gen_move_set_t**
Context of the received Generic Move Set message

### Public Members

bool **op_en**
Indicate if optional parameters are included

int16_t **delta_level**
Delta Level step to calculate Move speed for Generic Level state

uint8_t **tid**
Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t **delay**
Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_gen_def_trans_time_set_t**
Context of the received Generic Default Transition Time Set message

### Public Members

uint8_t **trans_time**
The value of the Generic Default Transition Time state

**struct esp_ble_mesh_server_recv_gen_onpowerup_set_t**
Context of the received Generic OnPowerUp Set message

### Public Members

uint8_t **onpowerup**
The value of the Generic OnPowerUp state

**struct esp_ble_mesh_server_recv_gen_power_level_set_t**
Context of the received Generic Power Level Set message
Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t power
   Target value of Generic Power Actual state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_power_default_set_t
   Context of the received Generic Power Default Set message

Public Members

uint16_t power
   The value of the Generic Power Default state

struct esp_ble_mesh_server_recv_gen_power_range_set_t
   Context of the received Generic Power Range Set message

Public Members

uint16_t range_min
   Value of Range Min field of Generic Power Range state

uint16_t range_max
   Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_server_recv_gen_loc_global_set_t
   Context of the received Generic Location Global Set message

Public Members

int32_t global_latitude
   Global Coordinates (Latitude)

int32_t global_longitude
   Global Coordinates (Longitude)

int16_t global_altitude
   Global Altitude

struct esp_ble_mesh_server_recv_gen_loc_local_set_t
   Context of the received Generic Location Local Set message
**Public Members**

```c
int16_t local_north
Local Coordinates (North)
```

```c
int16_t local_east
Local Coordinates (East)
```

```c
int16_t local_altitude
Local Altitude
```

```c
uint8_t floor_number
Floor Number
```

```c
uint16_t uncertainty
Uncertainty
```

```c
struct esp_ble_mesh_server_recv_gen_user_property_set_t
Context of the received Generic User Property Set message
```

**Public Members**

```c
uint16_t property_id
Property ID identifying a Generic User Property
```

```c
struct net_buf_simple *property_value
Raw value for the User Property
```

```c
struct esp_ble_mesh_server_recv_gen_admin_property_set_t
Context of the received Generic Admin Property Set message
```

**Public Members**

```c
uint16_t property_id
Property ID identifying a Generic Admin Property
```

```c
uint8_t user_access
Enumeration indicating user access
```

```c
struct net_buf_simple *property_value
Raw value for the Admin Property
```

```c
struct esp_ble_mesh_server_recv_gen_manufacturer_property_set_t
Context of the received Generic Manufacturer Property Set message
```

**Public Members**

```c
uint16_t property_id
Property ID identifying a Generic Manufacturer Property
```

```c
uint8_t user_access
Enumeration indicating user access
```

```c
struct esp_ble_mesh_generic_server_cb_param_t
Generic Server Model callback parameters
```

2.1. Bluetooth API
Public Members

```
esp_ble_mesh_model_t *model
Pointer to Generic Server Models
```

```
esp_ble_mesh_msg_ctx_t ctx
Context of the received messages
```

```
esp_ble_mesh_generic_server_cb_value_t value
Value of the received Generic Messages
```

Macros

```
ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI (cli_pub, cli_data)
Define a new Generic OnOff Client Model.
```

**Note** This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

**Return** New Generic OnOff Client Model instance.

**Parameters**

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

```
ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI (cli_pub, cli_data)
Define a new Generic Level Client Model.
```

**Note** This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

**Return** New Generic Level Client Model instance.

**Parameters**

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

```
ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI (cli_pub, cli_data)
Define a new Generic Default Transition Time Client Model.
```

**Note** This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

**Return** New Generic Default Transition Time Client Model instance.

**Parameters**

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

```
ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI (cli_pub, cli_data)
Define a new Generic Power OnOff Client Model.
```

**Note** This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.
Return New Generic Power OnOff Client Model instance.

Parameters

- **cli_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data**: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI(cli_pub, cli_data)`

Define a new Generic Power Level Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

Return New Generic Power Level Client Model instance.

Parameters

- **cli_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data**: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI(cli_pub, cli_data)`

Define a new Generic Battery Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

Return New Generic Battery Client Model instance.

Parameters

- **cli_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data**: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI(cli_pub, cli_data)`

Define a new Generic Location Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

Return New Generic Location Client Model instance.

Parameters

- **cli_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data**: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI(cli_pub, cli_data)`

Define a new Generic Property Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

Return New Generic Location Client Model instance.

Parameters

- **cli_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data**: Pointer to the unique struct `esp_ble_mesh_client_t`.

2.1. Bluetooth API
**ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV** (srv_pub, srv_data)
Generic Server Models related context.
Define a new Generic OnOff Server Model.

**Note**
1. The Generic OnOff Server Model is a root model.
2. This model shall support model publication and model subscription.

**Return** New Generic OnOff Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_onoff_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV** (srv_pub, srv_data)
Define a new Generic Level Server Model.

**Note**
1. The Generic Level Server Model is a root model.
2. This model shall support model publication and model subscription.

**Return** New Generic Level Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_level_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV** (srv_pub, srv_data)
Define a new Generic Default Transition Time Server Model.

**Note**
1. The Generic Default Transition Time Server Model is a root model.
2. This model shall support model publication and model subscription.

**Return** New Generic Default Transition Time Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_def_trans_time_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV** (srv_pub, srv_data)
Define a new Generic Power OnOff Server Model.

**Note**
1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.
2. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.

**Return** New Generic Power OnOff Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_srv_t`. 
ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Setup Server Model.

   1. This model shall support model subscription.

**Return** New Generic Power OnOff Setup Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_setup_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV (srv_pub, srv_data)
Define a new Generic Power Level Server Model.

**Note** 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.

**Return** New Generic Power Level Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_gen_power_level_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power Level Setup Server Model.

   1. This model shall support model subscription.

**Return** New Generic Power Level Setup Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_gen_power_level_setup_srv_t`.

ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV (srv_pub, srv_data)
Define a new Generic Battery Server Model.

**Note** 1. The Generic Battery Server Model is a root model.
   1. This model shall support model publication and model subscription.
   2. The model may be used to represent an element that is powered by a battery.

**Return** New Generic Battery Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_battery_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV**(srv_pub, srv_data)
Define a new Generic Location Server Model.

**Note** 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.

   1. This model shall support model publication and model subscription.

   2. The model may be used to represent an element that knows its location (global or local).

**Return** New Generic Location Server Model instance.

**Parameters**

• `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

• `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_location_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV**(srv_pub, srv_data)
Define a new Generic Location Setup Server Model.

**Note** 1. The Generic Location Setup Server model extends the Generic Location Server model.

  1. This model shall support model subscription.

**Return** New Generic Location Setup Server Model instance.

**Parameters**

• `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

• `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_location_setup_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV**(srv_pub, srv_data)
Define a new Generic User Property Server Model.

**Note** 1. The Generic User Property Server model is a root model.

  1. This model shall support model publication and model subscription.

**Return** New Generic User Property Server Model instance.

**Parameters**

• `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

• `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_user_prop_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV**(srv_pub, srv_data)
Define a new Generic Admin Property Server Model.

**Note** 1. The Generic Admin Property Server model extends the Generic User Property Server model.

  1. This model shall support model publication and model subscription.

**Return** New Generic Admin Property Server Model instance.

**Parameters**

• `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

• `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_admin_prop_srv_t`. 
ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV (srv_pub, srv_data)
Define a new Generic Manufacturer Property Server Model.

Note 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.
1. This model shall support model publication and model subscription.

Return New Generic Manufacturer Property Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_manu_prop_srv_t.

ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV (srv_pub, srv_data)
Define a new Generic User Property Server Model.

Note 1. The Generic Client Property Server model is a root model.
1. This model shall support model publication and model subscription.

Return New Generic Client Property Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_client_prop_srv_t.

Type Definitions

typedef void (*esp_ble_mesh_generic_client_cb_t) (esp_ble_mesh_generic_client_cb_event_t event,
    esp_ble_mesh_generic_client_cb_param_t *param)
Bluetooth Mesh Generic Client Model function.
Generic Client Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter

typedef void (*esp_ble_mesh_generic_server_cb_t) (esp_ble_mesh_generic_server_cb_event_t event,
    esp_ble_mesh_generic_server_cb_param_t *param)
Bluetooth Mesh Generic Server Model function.
Generic Server Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter
Enumerations

```c
typedef enum esp_ble_mesh_generic_client_cb_event_t {
    ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT,
    ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT,
    ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT,
    ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT,
    ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX
} esp_ble_mesh_generic_client_cb_event_t;
```

This enum value is the event of Generic Client Model

```c
typedef enum esp_ble_mesh_gen_user_prop_access_t {
    ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT,
    ESP_BLE_MESH_GEN_USER_ACCESS_READ,
    ESP_BLE_MESH_GEN_USER_ACCESS_WRITE,
    ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE
} esp_ble_mesh_gen_user_prop_access_t;
```

This enum value is the access value of Generic User Property

```c
typedef enum esp_ble_mesh_gen_admin_prop_access_t {
    ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP,
    ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ,
    ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE,
    ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE
} esp_ble_mesh_gen_admin_prop_access_t;
```

This enum value is the access value of Generic Admin Property

```c
typedef enum esp_ble_mesh_gen_manu_prop_access_t {
    ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP,
    ESP_BLE_MESH_GEN_MANU_ACCESS_READ
} esp_ble_mesh_gen_manu_prop_access_t;
```

This enum value is the access value of Generic Manufacturer Property

```c
typedef enum esp_ble_mesh_generic_server_cb_event_t {
    ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT,
    ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT
} esp_ble_mesh_generic_server_cb_event_t;
```

This enum value is the event of Generic Server Model

Values:

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Generic Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Get messages are received.
```
ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the
application layer when Generic Set/Set Unack messages are received.

ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX

Generic Client/Server Models

Header File

• bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h

Functions

esp_err_t esp_ble_mesh_register_health_client_callback(esp_ble_mesh_health_client_cb_t callback)

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

Return ESP_OK on success or error code otherwise.

Parameters
• callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_register_health_server_callback(esp_ble_mesh_health_server_cb_t callback)

Register BLE Mesh Health Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
• callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_health_client_get_state(esp_ble_mesh_client_common_param_t *params,
               esp_ble_mesh_health_client_get_state_t *get_state)

This function is called to get the Health Server states using the Health Client Model get messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to
esp_ble_mesh_opcode_health_client_get_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters
• params: Pointer to BLE Mesh common client parameters.
• get_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not
be set to NULL.

esp_err_t esp_ble_mesh_health_client_set_state(esp_ble_mesh_client_common_param_t *params,
               esp_ble_mesh_health_client_set_state_t *set_state)

This function is called to set the Health Server states using the Health Client Model set messages.
```
Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_set_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters
- `params`: Pointer to BLE Mesh common client parameters.
- `set_state`: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_health_server_fault_update(esp_ble_mesh_elem_t *element)
```

This function is called by the Health Server Model to update the context of its Health Current status.

Return ESP_OK on success or error code otherwise.

Parameters
- `element`: The element to which the Health Server Model belongs.

Unions

```c
union esp_ble_mesh_health_client_get_state_t
#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET
ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET
the get_state parameter in the esp_ble_mesh_health_client_get_state function should not be set to NULL.
```

Public Members

```c
esp_ble_mesh_health_fault_get_t fault_get
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.
```

```c
union esp_ble_mesh_health_client_set_state_t
#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET
ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK ESP_BLE_MESH_MODEL_OP_ATTENTION_SET
ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK the set_state parameter in the
esp_ble_mesh_health_client_set_state function should not be set to NULL.
```

Public Members

```c
esp_ble_mesh_health_attention_set_t attention_set
For ESP_BLE_MESH_MODEL_OP_ATTENTION_SET or ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK.
```

```c
esp_ble_mesh_health_period_set_t period_set
For ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET or ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK.
```

```c
esp_ble_mesh_health_fault_test_t fault_test
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK.
```

```c
esp_ble_mesh_health_fault_clear_t fault_clear
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK.
```

```c
union esp_ble_mesh_health_client_common_cb_param_t
#include <esp_ble_mesh_health_model_api.h> Health Client Model received message union.
```
Public Members

```c
esp_ble_mesh_health_current_status_cb_t current_status
    The health current status value
```

```c
esp_ble_mesh_health_fault_status_cb_t fault_status
    The health fault status value
```

```c
esp_ble_mesh_health_period_status_cb_t period_status
    The health period status value
```

```c
esp_ble_mesh_health_attention_status_cb_t attention_status
    The health attention status value
```

```c
union esp_ble_mesh_health_server_cb_param_t
    #include <esp_ble_mesh_health_model_api.h> Health Server Model callback parameters union.
```

Public Members

```c
esp_ble_mesh_health_fault_update_comp_cb_t fault_update_comp
    ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT
```

```c
esp_ble_mesh_health_fault_clear_cb_t fault_clear
    ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT
```

```c
esp_ble_mesh_health_fault_test_cb_t fault_test
    ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT
```

```c
esp_ble_mesh_health_attention_on_cb_t attention_on
    ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT
```

```c
esp_ble_mesh_health_attention_off_cb_t attention_off
    ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT
```

Structures

```c
struct esp_ble_mesh_health_srv_cb_t
    ESP BLE Mesh Health Server callback
```

Public Members

```c
esp_ble_mesh_cb_t fault_clear
    Clear health registered faults. Initialized by the stack.
```

```c
esp_ble_mesh_cb_t fault_test
    Run a specific health test. Initialized by the stack.
```

```c
esp_ble_mesh_cb_t attention_on
    Health attention on callback. Initialized by the stack.
```

```c
esp_ble_mesh_cb_t attention_off
    Health attention off callback. Initialized by the stack.
```

```c
struct esp_ble_mesh_health_test_t
    ESP BLE Mesh Health Server test Context
```
Public Members

uint8_t id_count
   Number of Health self-test ID

const uint8_t *test_ids
   Array of Health self-test IDs

uint16_t company_id
   Company ID used to identify the Health Fault state

uint8_t prev_test_id
   Current test ID of the health fault test

uint8_t current_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]
   Array of current faults

uint8_t registered_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]
   Array of registered faults

struct esp_ble_mesh_health_srv_t
   ESP BLE Mesh Health Server Model Context

Public Members

esp_ble_mesh_model_t *model
   Pointer to Health Server Model

esp_ble_mesh_health_srv_cb_t health_cb
   Health callback struct

struct k_delayed_work attention_timer
   Attention Timer state

bool attention_timer_start
   Attention Timer start flag

esp_ble_mesh_health_test_t health_test
   Health Server fault test

struct esp_ble_mesh_healthFault_get_t
   Parameter of Health Fault Get

Public Members

uint16_t company_id
   Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_set_t
   Parameter of Health Attention Set

Public Members

uint8_t attention
   Value of the Attention Timer state

struct esp_ble_mesh_health_period_set_t
   Parameter of Health Period Set
Public Members

- `uint8_t fast_period_divisor`
  Divider for the Publish Period

**struct esp_ble_mesh_health_fault_test_t**
Parameter of Health Fault Test

Public Members

- `uint16_t company_id`
  Bluetooth assigned 16-bit Company ID
- `uint8_t test_id`
  ID of a specific test to be performed

**struct esp_ble_mesh_health_fault_clear_t**
Parameter of Health Fault Clear

Public Members

- `uint16_t company_id`
  Bluetooth assigned 16-bit Company ID

**struct esp_ble_mesh_health_current_status_cb_t**
Parameters of Health Current Status

Public Members

- `uint8_t test_id`
  ID of a most recently performed test
- `uint16_t company_id`
  Bluetooth assigned 16-bit Company ID
- `struct net_buf_simple *fault_array`
  FaultArray field contains a sequence of 1-octet fault values

**struct esp_ble_mesh_health_fault_status_cb_t**
Parameters of Health Fault Status

Public Members

- `uint8_t test_id`
  ID of a most recently performed test
- `uint16_t company_id`
  Bluetooth assigned 16-bit Company ID
- `struct net_buf_simple *fault_array`
  FaultArray field contains a sequence of 1-octet fault values

**struct esp_ble_mesh_health_period_status_cb_t**
Parameter of Health Period Status

2.1. Bluetooth API
Public Members

`uint8_t fast_period_divisor`
Divider for the Publish Period

`struct esp_ble_mesh_health_attention_status_cb_t`
Parameter of Health Attention Status

Public Members

`uint8_t attention`
Value of the Attention Timer state

`struct esp_ble_mesh_health_client_cb_param_t`
Health Client Model callback parameters

Public Members

`int error_code`
Appropriate error code

`esp_ble_mesh_client_common_param_t *params`
The client common parameters.

`esp_ble_mesh_health_client_common_cb_param_t status_cb`
The health message status callback values

`struct esp_ble_mesh_health_fault_update_comp_cb_t`
Parameter of publishing Health Current Status completion event

Public Members

`int error_code`
The result of publishing Health Current Status

`esp_ble_mesh_elem_t *element`
Pointer to the element which contains the Health Server Model

`struct esp_ble_mesh_health_fault_clear_cb_t`
Parameters of Health Fault Clear event

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Health Server Model

`uint16_t company_id`
Bluetooth assigned 16-bit Company ID

`struct esp_ble_mesh_health_fault_test_cb_t`
Parameters of Health Fault Test event
Public Members

*esp_ble_mesh_model_t* model
   Pointer to the Health Server Model

uint8_t test_id
   ID of a specific test to be performed

uint16_t company_id
   Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_on_cb_t
   Parameter of Health Attention On event

Public Members

*esp_ble_mesh_model_t* model
   Pointer to the Health Server Model

uint8_t time
   Duration of attention timer on (in seconds)

struct esp_ble_mesh_health_attention_off_cb_t
   Parameter of Health Attention Off event

Public Members

*esp_ble_mesh_model_t* model
   Pointer to the Health Server Model

Macros

ESP_BLE_MESH_MODEL_HEALTH_SRV(srv, pub)
   Define a new Health Server Model.

   **Note** The Health Server Model can only be included by a Primary Element.

   **Return** New Health Server Model instance.

   **Parameters**
   - `srv`: Pointer to the unique struct esp_ble_mesh_health_srv_t.
   - `pub`: Pointer to the unique struct esp_ble_mesh_model_pub_t.

ESP_BLE_MESH_MODEL_HEALTH_CLI(cli_data)
   Define a new Health Client Model.

   **Note** This API needs to be called for each element on which the application needs to have a Health Client Model.

   **Return** New Health Client Model instance.

   **Parameters**
   - `cli_data`: Pointer to the unique struct esp_ble_mesh_client_t.
ESP_BLE_MESH_HEALTH_PUB_DEFINE (_name, _max, _role)
A helper to define a health publication context

Parameters

- _name: Name given to the publication context variable.
- _max: Maximum number of faults the element can have.
- _role: Role of the device which contains the model.

ESP_BLE_MESH_HEALTH_STANDARD_TEST
SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

ESP_BLE_MESH_NO_FAULT
Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

Type Definitions

typedef void (*esp_ble_mesh_health_client_cb_t)
    (esp_ble_mesh_health_client_cb_event_t event, esp_ble_mesh_health_client_cb_param_t *param)

    Bluetooth Mesh Health Client and Server Model function.
    Health Client Model callback function type

    Parameters
        • event: Event type
        • param: Pointer to callback parameter
typedef void (*esp_ble_mesh_health_server_cb_t)(esp_ble_mesh_health_server_cb_event_t event, esp_ble_mesh_health_server_cb_param_t *param)

Health Server Model callback function type.

Parameters

• event: Event type
• param: Pointer to callback parameter

Enumerations

enum esp_ble_mesh_health_client_cb_event_t
This enum value is the event of Health Client Model

Values:

ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_HEALTH_CLIENT_EVT_MAX

enum esp_ble_mesh_health_server_cb_event_t
This enum value is the event of Health Server Model

Values:

ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT
ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT
ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT
ESP_BLE_MESH_HEALTH_SERVER_EVT_MAX

Sensor Client/Server Models

Header File

• bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h

Functions

esp_err_t esp_ble_mesh_register_light_client_callback(esp_ble_mesh_light_client_cb_t callback)

Register BLE Mesh Light Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
• callback: pointer to the callback function.

```c
esp_err_t esp_ble_mesh_light_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_get_state_t *get_state)
```

Get the value of Light Server Model states using the Light Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- params: Pointer to BLE Mesh common client parameters.
- get_state: Pointer of light get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_light_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_set_state_t *set_state)
```

Set the value of Light Server Model states using the Light Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- params: Pointer to BLE Mesh common client parameters.
- set_state: Pointer of light set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_lighting_server_callback(esp_ble_mesh_lighting_server_cb_t callback)
```

Register BLE Mesh Lighting Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- callback: Pointer to the callback function.

**Unions**

```c
union esp_ble_mesh_light_client_get_state_t
    #include <esp_ble_mesh_lighting_model_api.h> Lighting Client Model get message union.
```

**Public Members**

```c

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

**struct esp_ble_mesh_light_lightness_default_set_t**
Parameter of Light Lightness Default Set

2.1. Bluetooth API
**Public Members**

`uint16_t lightness`

The value of the Light Lightness Default state

**struct esp_ble_mesh_light_lightness_range_set_t**
Parameters of Light Lightness Range Set

**Public Members**

`uint16_t range_min`

Value of range min field of light lightness range state

`uint16_t range_max`

Value of range max field of light lightness range state

**struct esp_ble_mesh_light_ctl_set_t**
Parameters of Light CTL Set

**Public Members**

`bool op_en`

Indicate if optional parameters are included

`uint16_t ctl_lightness`

Target value of light ctl lightness state

`uint16_t ctl_temperature`

Target value of light ctl temperature state

`int16_t ctl_delta_uv`

Target value of light ctl delta UV state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

**struct esp_ble_mesh_light_ctl_temperature_set_t**
Parameters of Light CTL Temperature Set

**Public Members**

`bool op_en`

Indicate if optional parameters are included

`uint16_t ctl_temperature`

Target value of light ctl temperature state

`int16_t ctl_delta_uv`

Target value of light ctl delta UV state

`uint8_t tid`

Transaction ID
uint8_t **trans_time**
   Time to complete state transition (optional)

uint8_t **delay**
   Indicate message execution delay (C.1)

**struct esp_ble_mesh_light_ctl_temperature_range_set_t**
Parameters of Light CTL Temperature Range Set

**Public Members**

uint16_t **range_min**
   Value of temperature range min field of light ctl temperature range state

uint16_t **range_max**
   Value of temperature range max field of light ctl temperature range state

**struct esp_ble_mesh_light_ctl_default_set_t**
Parameters of Light CTL Default Set

**Public Members**

uint16_t **lightness**
   Value of light lightness default state

uint16_t **temperature**
   Value of light temperature default state

int16_t **delta_uv**
   Value of light delta UV default state

**struct esp_ble_mesh_light_hsl_set_t**
Parameters of Light HSL Set

**Public Members**

bool **op_en**
   Indicate if optional parameters are included

uint16_t **hsl_lightness**
   Target value of light hsl lightness state

uint16_t **hsl_hue**
   Target value of light hsl hue state

uint16_t **hsl_saturation**
   Target value of light hsl saturation state

uint8_t **tid**
   Transaction ID

uint8_t **trans_time**
   Time to complete state transition (optional)

uint8_t **delay**
   Indicate message execution delay (C.1)

**struct esp_ble_mesh_light_hsl_hue_set_t**
Parameters of Light HSL Hue Set

2.1. Bluetooth API
**Public Members**

bool **op_en**  
Indicate if optional parameters are included

uint16_t **hue**  
Target value of light hsl hue state

uint8_t **tid**  
Transaction ID

uint8_t **trans_time**  
Time to complete state transition (optional)

uint8_t **delay**  
Indicate message execution delay (C.1)

**struct esp_ble_mesh_light_hsl_saturation_set_t**  
Parameters of Light HSL Saturation Set

**Public Members**

bool **op_en**  
Indicate if optional parameters are included

uint16_t **saturation**  
Target value of light hsl hue state

uint8_t **tid**  
Transaction ID

uint8_t **trans_time**  
Time to complete state transition (optional)

uint8_t **delay**  
Indicate message execution delay (C.1)

**struct esp_ble_mesh_light_hsl_default_set_t**  
Parameters of Light HSL Default Set

**Public Members**

uint16_t **lightness**  
Value of light lightness default state

uint16_t **hue**  
Value of light hue default state

uint16_t **saturation**  
Value of light saturation default state

**struct esp_ble_mesh_light_hsl_range_set_t**  
Parameters of Light HSL Range Set

**Public Members**

uint16_t **hue_range_min**  
Value of hue range min field of light hsl hue range state
struct esp_ble_mesh_light_xyl_set_t
Parameters of Light xyL Set

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t xyl_lightness
The target value of the Light xyL Lightness state

uint16_t xyl_x
The target value of the Light xyL x state

uint16_t xyl_y
The target value of the Light xyL y state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_xyl_default_set_t
Parameters of Light xyL Default Set

Public Members

uint16_t lightness
The value of the Light Lightness Default state

uint16_t xyl_x
The value of the Light xyL x Default state

uint16_t xyl_y
The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_set_t
Parameters of Light xyL Range Set

Public Members

uint16_t xyl_x_range_min
The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t xyl_x_range_max
The value of the xyL x Range Max field of the Light xyL x Range state
uint16_t xyl_y_range_min
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t xyl_y_range_max
The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_light_lc_mode_set_t
Parameter of Light LC Mode Set

Public Members

uint8_t mode
The target value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_set_t
Parameter of Light LC OM Set

Public Members

uint8_t mode
The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_set_t
Parameters of Light LC Light OnOff Set

Public Members

bool op_en
Indicate whether optional parameters included

uint8_t light_onoff
The target value of the Light LC Light OnOff state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lc_property_get_t
Parameter of Light LC Property Get

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct esp_ble_mesh_light_lc_property_set_t
Parameters of Light LC Property Set
**Public Members**

```c
uint16_t property_id
    Property ID identifying a Light LC Property

struct net_buf_simple *property_value
    Raw value for the Light LC Property
```

**struct esp_ble_mesh_light_lightness_status_cb_t**

Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.

Parameters of Light Lightness Status

**Public Members**

```c
bool op_en
    Indicate if optional parameters are included

uint16_t present_lightness
    Current value of light lightness actual state

uint16_t target_lightness
    Target value of light lightness actual state (optional)

uint8_t remain_time
    Time to complete state transition (C.1)
```

**struct esp_ble_mesh_light_lightness_linear_status_cb_t**

Parameters of Light Lightness Linear Status

**Public Members**

```c
bool op_en
    Indicate if optional parameters are included

uint16_t present_lightness
    Current value of light lightness linear state

uint16_t target_lightness
    Target value of light lightness linear state (optional)

uint8_t remain_time
    Time to complete state transition (C.1)
```

**struct esp_ble_mesh_light_lightness_last_status_cb_t**

Parameter of Light Lightness Last Status

**Public Members**

```c
uint16_t lightness
    The value of the Light Lightness Last state
```

**struct esp_ble_mesh_light_lightness_default_status_cb_t**

Parameter of Light Lightness Default Status
Public Members

uint16_t lightness
   The value of the Light Lightness default State

struct esp_ble_mesh_light_lightness_range_status_cb_t
   Parameters of Light Lightness Range Status

Public Members

uint8_t status_code
   Status Code for the request message

uint16_t range_min
   Value of range min field of light lightness range state

uint16_t range_max
   Value of range max field of light lightness range state

struct esp_ble_mesh_light_ctl_status_cb_t
   Parameters of Light CTL Status

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t present_ctl_lightness
   Current value of light ctl lightness state

uint16_t present_ctl_temperature
   Current value of light ctl temperature state

uint16_t target_ctl_lightness
   Target value of light ctl lightness state (optional)

uint16_t target_ctl_temperature
   Target value of light ctl temperature state (C.1)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_status_cb_t
   Parameters of Light CTL Temperature Status

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t present_ctl_temperature
   Current value of light ctl temperature state

uint16_t present_ctl_delta_uv
   Current value of light ctl delta UV state

uint16_t target_ctl_temperature
   Target value of light ctl temperature state (optional)
uint16_t \texttt{target_ctl_delta_uv} \\
Target value of light ctl delta UV state (C.1)

\texttt{uint8_t \_remain\_time} \\
Time to complete state transition (C.1)

\begin{verbatim}
struct esp_ble_mesh_light_ctl_temperature_range_status_cb_t 
Parameters of Light CTL Temperature Range Status

\textbf{Public Members}

\texttt{uint8_t \_status\_code} \\
Status code for the request message

\texttt{uint16_t \_range\_min} \\
Value of temperature range min field of light ctl temperature range state

\texttt{uint16_t \_range\_max} \\
Value of temperature range max field of light ctl temperature range state
\end{verbatim}

\begin{verbatim}
struct esp_ble_mesh_light_ctl_default_status_cb_t 
Parameters of Light CTL Default Status

\textbf{Public Members}

\texttt{uint16_t \_lightness} \\
Value of light lightness default state

\texttt{uint16_t \_temperature} \\
Value of light temperature default state

\texttt{int16_t \_delta\_uv} \\
Value of light delta UV default state
\end{verbatim}

\begin{verbatim}
struct esp_ble_mesh_light_hsl_status_cb_t 
Parameters of Light HSL Status

\textbf{Public Members}

\texttt{bool \_op\_en} \\
Indicate if optional parameters are included

\texttt{uint16_t \_hsl\_lightness} \\
Current value of light hsl lightness state

\texttt{uint16_t \_hsl\_hue} \\
Current value of light hsl hue state

\texttt{uint16_t \_hsl\_saturation} \\
Current value of light hsl saturation state

\texttt{uint8_t \_remain\_time} \\
Time to complete state transition (optional)
\end{verbatim}

\begin{verbatim}
struct esp_ble_mesh_light_hsl_target_status_cb_t 
Parameters of Light HSL Target Status
\end{verbatim}

2.1. Bluetooth API
Public Members

```c
bool op_en
   Indicate if optional parameters are included

uint16_t hsl_lightness_target
   Target value of light hsl lightness state

uint16_t hsl_hue_target
   Target value of light hsl hue state

uint16_t hsl_saturation_target
   Target value of light hsl saturation state

uint8_t remain_time
   Time to complete state transition (optional)
```

```c
struct esp_ble_mesh_light_hsl_hue_status_cb_t
Parameters of Light HSL Hue Status
```

Public Members

```c
bool op_en
   Indicate if optional parameters are included

uint16_t present_hue
   Current value of light hsl hue state

uint16_t target_hue
   Target value of light hsl hue state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)
```

```c
struct esp_ble_mesh_light_hsl_saturation_status_cb_t
Parameters of Light HSL Saturation Status
```

Public Members

```c
bool op_en
   Indicate if optional parameters are included

uint16_t present_saturation
   Current value of light hsl saturation state

uint16_t target_saturation
   Target value of light hsl saturation state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)
```

```c
struct esp_ble_mesh_light_hsl_default_status_cb_t
Parameters of Light HSL Default Status
```

Public Members

```c
uint16_t lightness
   Value of light lightness default state
```
uint16_t hue
    Value of light hue default state

uint16_t saturation
    Value of light saturation default state

struct esp_ble_mesh_light_hsl_range_status_cb_t
    Parameters of Light HSL Range Status

Public Members

uint8_t status_code
    Status code for the request message

uint16_t hue_range_min
    Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
    Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
    Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
    Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_light_xyl_status_cb_t
    Parameters of Light xyL Status

Public Members

bool op_en
    Indicate whether optional parameters included

uint16_t xyl_lightness
    The present value of the Light xyL Lightness state

uint16_t xyl_x
    The present value of the Light xyL x state

uint16_t xyl_y
    The present value of the Light xyL y state

uint8_t remain_time
    Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_target_status_cb_t
    Parameters of Light xyL Target Status

Public Members

bool op_en
    Indicate whether optional parameters included

uint16_t target_xyl_lightness
    The target value of the Light xyL Lightness state

uint16_t target_xyl_x
    The target value of the Light xyL x state

2.1. Bluetooth API
uint16_t target_xyl_y
    The target value of the Light xyL y state

uint8_t remain_time
    Time to complete state transition (optional)

**struct esp_ble_mesh_light_xyl_default_status_cb_t**
    Parameters of Light xyL Default Status

**Public Members**

uint16_t lightness
    The value of the Light Lightness Default state

uint16_t xyl_x
    The value of the Light xyL x Default state

uint16_t xyl_y
    The value of the Light xyL y Default state

**struct esp_ble_mesh_light_xyl_range_status_cb_t**
    Parameters of Light xyL Range Status

**Public Members**

uint8_t status_code
    Status Code for the requesting message

uint16_t xyl_x_range_min
    The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t xyl_x_range_max
    The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t xyl_y_range_min
    The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t xyl_y_range_max
    The value of the xyL y Range Max field of the Light xyL y Range state

**struct esp_ble_mesh_light_lc_mode_status_cb_t**
    Parameter of Light LC Mode Status

**Public Members**

uint8_t mode
    The present value of the Light LC Mode state

**struct esp_ble_mesh_light_lc_om_status_cb_t**
    Parameter of Light LC OM Status

**Public Members**

uint8_t mode
    The present value of the Light LC Occupancy Mode state
struct esp_ble_mesh_light_lc_light_onoff_status_cb_t
Parameters of Light LC Light OnOff Status

Public Members

bool op_en
  Indicate whether optional parameters included

uint8_t present_light_onoff
  The present value of the Light LC Light OnOff state

uint8_t target_light_onoff
  The target value of the Light LC Light OnOff state (Optional)

uint8_t remain_time
  Time to complete state transition (C.1)

struct esp_ble_mesh_light_lc_property_status_cb_t
Parameters of Light LC Property Status

Public Members

uint16_t property_id
  Property ID identifying a Light LC Property

struct net_buf_simple *property_value
  Raw value for the Light LC Property

struct esp_ble_mesh_light_client_cb_param_t
Lighting Client Model callback parameters

Public Members

int error_code
  Appropriate error code

esp_ble_mesh_client_common_param_t *params
  The client common parameters.

esp_ble_mesh_light_client_status_cb_t status_cb
  The light status message callback values

struct esp_ble_mesh_light_lightness_state_t
Parameters of Light Lightness state

Public Members

uint16_t lightness_linear
  The present value of Light Lightness Linear state

uint16_t target_lightness_linear
  The target value of Light Lightness Linear state

uint16_t lightness_actual
  The present value of Light Lightness Actual state
\textbf{struct esp\_ble\_mesh\_light\_lightness\_srv\_t}

User data of Light Lightness Server Model

\textbf{Public Members}

\texttt{esp\_ble\_mesh\_model\_t \textast model}

Pointer to the Lighting Lightness Server Model. Initialized internally.

\texttt{esp\_ble\_mesh\_server\_rsp\_ctrl\_t \texttt{rsp\_ctrl}}

Response control of the server model received messages

\texttt{esp\_ble\_mesh\_light\_lightness\_state\_t \textast state}

Parameters of the Light Lightness state

\texttt{esp\_ble\_mesh\_last\_msg\_info\_t \texttt{last}}

Parameters of the last received set message

\texttt{esp\_ble\_mesh\_state\_transition\_t \texttt{actual\_transition}}

Parameters of state transition

\texttt{esp\_ble\_mesh\_state\_transition\_t \texttt{linear\_transition}}

Parameters of state transition

\texttt{int32\_t \texttt{tt\_delta\_lightness\_actual}}

Delta change value of lightness actual state transition

\texttt{int32\_t \texttt{tt\_delta\_lightness\_linear}}

Delta change value of lightness linear state transition

\textbf{struct esp\_ble\_mesh\_light\_lightness\_setup\_srv\_t}

User data of Light Lightness Setup Server Model

\textbf{Public Members}

\texttt{esp\_ble\_mesh\_model\_t \textast model}

Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

\texttt{esp\_ble\_mesh\_server\_rsp\_ctrl\_t \texttt{rsp\_ctrl}}

Response control of the server model received messages

\texttt{esp\_ble\_mesh\_light\_lightness\_state\_t \textast state}

Parameters of the Light Lightness state
```c
#include <cstdint>

struct esp_ble_mesh_light_ctl_state_t {
  // Parameters of Light CTL state

  // Public Members
  uint16_t lightness;          // The present value of Light CTL Lightness state
  uint16_t target_lightness;  // The target value of Light CTL Lightness state
  uint16_t temperature;       // The present value of Light CTL Temperature state
  uint16_t target_temperature; // The target value of Light CTL Temperature state
  int16_t delta_uv;           // The present value of Light CTL Delta UV state
  int16_t target_delta_uv;    // The target value of Light CTL Delta UV state
  uint8_t status_code;        // The statue code of setting Light CTL Temperature Range state
  uint16_t temperature_range_min; // The minimum value of Light CTL Temperature Range state
  uint16_t temperature_range_max; // The maximum value of Light CTL Temperature Range state
  uint16_t lightness_default;  // The value of Light Lightness Default state
  uint16_t temperature_default; // The value of Light CTL Temperature Default state
  int16_t delta_uv_default;    // The value of Light CTL Delta UV Default state
}

struct esp_ble_mesh_light_ctl_srv_t {
  // User data of Light CTL Server Model

  // Public Members
  esp_ble_mesh_model_t *model;   // Pointer to the Lighting CTL Server Model. Initialized internally.
  esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl; // Response control of the server model received messages
  esp_ble_mesh_light_ctl_state_t *state; // Parameters of the Light CTL state
  esp_ble_mesh_last_msg_info_t last;     // Parameters of the last received set message
  esp_ble_mesh_state_transition_t transition; // Parameters of state transition
}
```

2.1. Bluetooth API
int32_t tt_delta_lightness
Delta change value of lightness state transition

int32_t tt_delta_temperature
Delta change value of temperature state transition

int32_t tt_delta_delta_uv
Delta change value of delta uv state transition

struct esp_ble_mesh_light_ctl_setup_srv_t
User data of Light CTL Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting CTL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t *state
Parameters of the Light CTL state

struct esp_ble_mesh_light_ctl_temp_srv_t
User data of Light CTL Temperature Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t *state
Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
Parameters of state transition

int32_t tt_delta_temperature
Delta change value of temperature state transition

int32_t tt_delta_delta_uv
Delta change value of delta uv state transition

struct esp_ble_mesh_light_hsl_state_t
Parameters of Light HSL state

Public Members

uint16_t lightness
The present value of Light HSL Lightness state

uint16_t target_lightness
The target value of Light HSL Lightness state
uint16_t hue
  The present value of Light HSL Hue state

uint16_t target_hue
  The target value of Light HSL Hue state

uint16_t saturation
  The present value of Light HSL Saturation state

uint16_t target_saturation
  The target value of Light HSL Saturation state

uint16_t lightness_default
  The value of Light Lightness Default state

uint16_t hue_default
  The value of Light HSL Hue Default state

uint16_t saturation_default
  The value of Light HSL Saturation Default state

uint8_t status_code
  The status code of setting Light HSL Hue & Saturation Range state

uint16_t hue_range_min
  The minimum value of Light HSL Hue Range state

uint16_t hue_range_max
  The maximum value of Light HSL Hue Range state

uint16_t saturation_range_min
  The minimum value of Light HSL Saturation state

uint16_t saturation_range_max
  The maximum value of Light HSL Saturation state

struct esp_ble_mesh_light_hsl_srv_t
  User data of Light HSL Server Model

Public Members

esp_ble_mesh_model_t *model
  Pointer to the Lighting HSL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
  Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
  Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t last
  Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
  Parameters of state transition

int32_t tt_delta_lightness
  Delta change value of lightness state transition

int32_t tt_delta_hue
  Delta change value of hue state transition
struct esp_ble_mesh_light_hsl_setup_srv_t
User data of Light HSL Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting HSL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
Parameters of the Light HSL state

struct esp_ble_mesh_light_hsl_hue_srv_t
User data of Light HSL Hue Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting HSL Hue Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
Parameters of state transition

int32_t tt_delta_hue
Delta change value of hue state transition

struct esp_ble_mesh_light_hsl_sat_srv_t
User data of Light HSL Saturation Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
Parameters of state transition
**Public Members**

`int32_t tt_delta_saturation`
Delta change value of saturation state transition

**struct esp_ble_mesh_light_xyl_state_t**
Parameters of Light xyL state

**Public Members**

`uint16_t lightness`
The present value of Light xyL Lightness state

`uint16_t target_lightness`
The target value of Light xyL Lightness state

`uint16_t x`
The present value of Light xyL x state

`uint16_t target_x`
The target value of Light xyL x state

`uint16_t y`
The present value of Light xyL y state

`uint16_t target_y`
The target value of Light xyL y state

`uint16_t lightness_default`
The value of Light Lightness Default state

`uint16_t x_default`
The value of Light xyL x Default state

`uint16_t y_default`
The value of Light xyL y Default state

`uint8_t status_code`
The status code of setting Light xyL x & y Range state

`uint16_t x_range_min`
The minimum value of Light xyL x Range state

`uint16_t x_range_max`
The maximum value of Light xyL x Range state

`uint16_t y_range_min`
The minimum value of Light xyL y Range state

`uint16_t y_range_max`
The maximum value of Light xyL y Range state

**struct esp_ble_mesh_light_xyl_srv_t**
User data of Light xyL Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Lighting xyL Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages
*esp_ble_mesh_light_xyl_state_t* `state`
Parameters of the Light xyL state

*esp_ble_mesh_last_msg_info_t* `last`
Parameters of the last received set message

*esp_ble_mesh_state_transition_t* `transition`
Parameters of state transition

`int32_t tt_delta_lightness`
Delta change value of lightness state transition

`int32_t tt_delta_x`
Delta change value of x state transition

`int32_t tt_delta_y`
Delta change value of y state transition

*struct esp_ble_mesh_light_xyl_setup_srv_t*
User data of Light xyL Setup Server Model

**Public Members**

*esp_ble_mesh_model_t* `*model`
Pointer to the Lighting xyL Setup Server Model. Initialized internally.

*esp_BLE_Mesh_server_rsp_ctrl_t* `*rsp_ctrl`
Response control of the server model received messages

*esp_ble_mesh_light_xyl_state_t* `*state`
Parameters of the Light xyL state

*struct esp_ble_mesh_light_lc_state_t*
Parameters of Light LC states

**Public Members**

`uint32_t mode`
0b0 The controller is turned off.

• The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.

• The binding with the Light Lightness state is enabled. The value of Light LC Mode state

`uint32_t occupancy_mode`
The value of Light LC Occupancy Mode state

`uint32_t light_onoff`
The present value of Light LC Light OnOff state

`uint32_t target_light_onoff`
The target value of Light LC Light OnOff state

`uint32_t occupancy`
The value of Light LC Occupancy state

`uint32_t ambient_luxlevel`
The value of Light LC Ambient LuxLevel state

`uint16_t linear_output`
1. Light LC Linear Output = max((Lightness Out)^2/65535, Regulator Output)
2. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output

3. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

```c
struct esp_ble_mesh_light_lc_property_state_t
```
Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

**Public Members**

- `uint32_t time_occupancy_delay`
  A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

- `uint32_t time_fade_on`
  A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

- `uint32_t time_run_on`
  A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

- `uint32_t time_fade`
  A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

- `uint32_t time_prolong`
  A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

- `uint32_t time_fade_standby_auto`
  A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

- `uint32_t time_fade_standby_manual`
  A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

- `uint16_t lightness_on`
  A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

- `uint16_t lightness_prolong`
  A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

- `uint16_t lightness_standby`
  A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

---

2.1. Bluetooth API
uint16_t ambient_luxlevel_on
  A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambient_luxlevel_prolong
  A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

uint16_t ambient_luxlevel_standby
  A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

float regulator_kiu
  A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid
  A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu
  A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd
  A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t regulator_accuracy
  A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t set_occupancy_to_1_delay
  If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct esp_ble_mesh_light_lc_state_machine_t
  Parameters of Light LC state machine

Public Members

uint8_t fade_on
  The value of transition time of Light LC Time Fade On

uint8_t fade
  The value of transition time of Light LC Time Fade

uint8_t fade_standby_auto
  The value of transition time of Light LC Time Fade Standby Auto
**uint8_t fade_standby_manual**
The value of transition time of Light LC Time Fade Standby Manual

**struct esp_ble_mesh_light_lc_state_machine_t::[anonymous] trans_time**
The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

**esp_ble_mesh_lc_state_t state**
The value of Light LC state machine state

**struct kDelayed_work timer**
Timer of Light LC state machine

**struct esp_ble_mesh_light_control_t**
Parameters of Light Lightness controller

**Public Members**

**esp_ble_mesh_light_lc_state_t state**
Parameters of Light LC state

**esp_ble_mesh_light_lc_property_state_t prop_state**
Parameters of Light LC Property state

**esp_ble_mesh_light_lc_state_machine_t state_machine**
Parameters of Light LC state machine

**struct esp_ble_mesh_light_lc_srv_t**
User data of Light LC Server Model

**Public Members**

**esp_ble_mesh_model_t *model**
Pointer to the Lighting LC Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl**
Response control of the server model received messages

**esp_ble_mesh_light_control_t *lc**
Parameters of the Light controller

**esp_ble_mesh_last_msg_info_t last**
Parameters of the last received set message

**esp_ble_mesh_state_transition_t transition**
Parameters of state transition

**struct esp_ble_mesh_light_lc_setup_srv_t**
User data of Light LC Setup Server Model

**Public Members**

**esp_ble_mesh_model_t *model**
Pointer to the Lighting LC Setup Server Model. Initialized internally.
esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_control_t *lc
Parameters of the Light controller

struct esp_ble_mesh_state_change_light_lightness_set_t
Parameter of Light Lightness Actual state change event

Public Members

uint16_t lightness
The value of Light Lightness Actual state

struct esp_ble_mesh_state_change_light_lightness_linear_set_t
Parameter of Light Lightness Linear state change event

Public Members

uint16_t lightness
The value of Light Lightness Linear state

struct esp_ble_mesh_state_change_light_lightness_default_set_t
Parameter of Light Lightness Default state change event

Public Members

uint16_t lightness
The value of Light Lightness Default state

struct esp_ble_mesh_state_change_light_lightness_range_set_t
Parameters of Light Lightness Range state change event

Public Members

uint16_t range_min
The minimum value of Light Lightness Range state

uint16_t range_max
The maximum value of Light Lightness Range state

struct esp_ble_mesh_state_change_light_ctl_set_t
Parameters of Light CTL state change event

Public Members

uint16_t lightness
The value of Light CTL Lightness state

uint16_t temperature
The value of Light CTL Temperature state

int16_t delta_uv
The value of Light CTL Delta UV state
struct esp_ble_mesh_state_change_light_ctl_temperature_set_t
Parameters of Light CTL Temperature state change event

Public Members

uint16_t temperature
  The value of Light CTL Temperature state
int16_t delta_uv
  The value of Light CTL Delta UV state

struct esp_ble_mesh_state_change_light_ctl_temperature_range_set_t
Parameters of Light CTL Temperature Range state change event

Public Members

uint16_t range_min
  The minimum value of Light CTL Temperature Range state
uint16_t range_max
  The maximum value of Light CTL Temperature Range state

struct esp_ble_mesh_state_change_light_ctl_default_set_t
Parameters of Light CTL Default state change event

Public Members

uint16_t lightness
  The value of Light Lightness Default state
uint16_t temperature
  The value of Light CTL Temperature Default state
int16_t delta_uv
  The value of Light CTL Delta UV Default state

struct esp_ble_mesh_state_change_light_hsl_set_t
Parameters of Light HSL state change event

Public Members

uint16_t lightness
  The value of Light HSL Lightness state
uint16_t hue
  The value of Light HSL Hue state
uint16_t saturation
  The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_hue_set_t
Parameter of Light HSL Hue state change event

2.1. Bluetooth API
Public Members

uint16_t hue
   The value of Light HSL Hue state

struct esp_ble_mesh_state_change_light_hsl_saturation_set_t
   Parameter of Light HSL Saturation state change event

Public Members

uint16_t saturation
   The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_default_set_t
   Parameters of Light HSL Default state change event

Public Members

uint16_t lightness
   The value of Light HSL Lightness Default state

   uint16_t hue
      The value of Light HSL Hue Default state

   uint16_t saturation
      The value of Light HSL Saturation Default state

struct esp_ble_mesh_state_change_light_hsl_range_set_t
   Parameters of Light HSL Range state change event

Public Members

   uint16_t hue_range_min
      The minimum hue value of Light HSL Range state

   uint16_t hue_range_max
      The maximum hue value of Light HSL Range state

   uint16_t saturation_range_min
      The minimum saturation value of Light HSL Range state

   uint16_t saturation_range_max
      The maximum saturation value of Light HSL Range state

struct esp_ble_mesh_state_change_light_xyl_set_t
   Parameters of Light xyL state change event

Public Members

   uint16_t lightness
      The value of Light xyL Lightness state

   uint16_t x
      The value of Light xyL x state

   uint16_t y
      The value of Light xyL y state
struct esp_ble_mesh_state_change_light_xyl_default_set_t
Parameters of Light xyL Default state change event

Public Members

- uint16_t lightness
  The value of Light Lightness Default state
- uint16_t x
  The value of Light xyL x Default state
- uint16_t y
  The value of Light xyL y Default state

struct esp_ble_mesh_state_change_light_xyl_range_set_t
Parameters of Light xyL Range state change event

Public Members

- uint16_t x_range_min
  The minimum value of Light xyL x Range state
- uint16_t x_range_max
  The maximum value of Light xyL x Range state
- uint16_t y_range_min
  The minimum value of Light xyL y Range state
- uint16_t y_range_max
  The maximum value of Light xyL y Range state

struct esp_ble_mesh_state_change_light_lc_mode_set_t
Parameter of Light LC Mode state change event

Public Members

- uint8_t mode
  The value of Light LC Mode state

struct esp_ble_mesh_state_change_light_lc_om_set_t
Parameter of Light LC Occupancy Mode state change event

Public Members

- uint8_t mode
  The value of Light LC Occupancy Mode state

struct esp_ble_mesh_state_change_light_lc_light_onoff_set_t
Parameter of Light LC Light OnOff state change event

Public Members

- uint8_t onoff
  The value of Light LC Light OnOff state
struct esp_ble_mesh_state_change_light_lc_property_set_t
Parameters of Light LC Property state change event

Public Members

uint16_t property_id
The property id of Light LC Property state

struct net_buf_simple *property_value
The property value of Light LC Property state

struct esp_ble_mesh_state_change_sensor_status_t
Parameters of Sensor Status state change event

Public Members

uint16_t property_id
The value of Sensor Property ID

uint8_t occupancy
The value of Light LC Occupancy state

uint32_t set_occupancy_to_1_delay
The value of Light LC Set Occupancy to 1 Delay state

uint32_t ambient_luxlevel
The value of Light LC Ambient Luxlevel state

union esp_ble_mesh_state_change_sensor_status_t::{anonymous} state
Parameters of Sensor Status related state

struct esp_ble_mesh_server_recv_light_lc_property_get_t
Context of the received Light LC Property Get message

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct esp_ble_mesh_server_recv_light_lightness_set_t
Context of the received Light Lightness Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light lightness actual state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)
uint8_t \texttt{delay} \\
Indicate message execution delay (C.1)

\begin{verbatim}
struct esp_ble_mesh_server_recv_light_lightness_linear_set_t \\
\end{verbatim}
Context of the received Light Lightness Linear Set message

**Public Members**

- bool \texttt{op_en} \\
  Indicate if optional parameters are included
- uint16_t \texttt{lightness} \\
  Target value of light lightness linear state
- uint8_t \texttt{tid} \\
  Transaction ID
- uint8_t \texttt{trans_time} \\
  Time to complete state transition (optional)
- uint8_t \texttt{delay} \\
  Indicate message execution delay (C.1)

\begin{verbatim}
struct esp_ble_mesh_server_recv_light_lightness_default_set_t \\
\end{verbatim}
Context of the received Light Lightness Default Set message

**Public Members**

- uint16_t \texttt{lightness} \\
  The value of the Light Lightness Default state

\begin{verbatim}
struct esp_ble_mesh_server_recv_light_lightness_range_set_t \\
\end{verbatim}
Context of the received Light Lightness Range Set message

**Public Members**

- uint16_t \texttt{range_min} \\
  Value of range min field of light lightness range state
- uint16_t \texttt{range_max} \\
  Value of range max field of light lightness range state

\begin{verbatim}
struct esp_ble_mesh_server_recv_light_ctl_set_t \\
\end{verbatim}
Context of the received Light CTL Set message

**Public Members**

- bool \texttt{op_en} \\
  Indicate if optional parameters are included
- uint16_t \texttt{lightness} \\
  Target value of light ctl lightness state
- uint16_t \texttt{temperature} \\
  Target value of light ctl temperature state

2.1. Bluetooth API
int16_t \texttt{delta\_uv}  
Target value of light ctl delta UV state

uint8_t \texttt{tid}  
Transaction ID

uint8_t \texttt{trans\_time}  
Time to complete state transition (optional)

uint8_t \texttt{delay}  
Indicate message execution delay (C.1)

\textbf{struct esp\_ble\_mesh\_server\_recv\_light\_ctl\_temperature\_set\_t}  
Context of the received Light CTL Temperature Set message

\textbf{Public Members}

bool \texttt{op\_en}  
Indicate if optional parameters are included

uint16_t \texttt{temperature}  
Target value of light ctl temperature state

int16_t \texttt{delta\_uv}  
Target value of light ctl delta UV state

uint8_t \texttt{tid}  
Transaction ID

uint8_t \texttt{trans\_time}  
Time to complete state transition (optional)

uint8_t \texttt{delay}  
Indicate message execution delay (C.1)

\textbf{struct esp\_ble\_mesh\_server\_recv\_light\_ctl\_temperature\_range\_set\_t}  
Context of the received Light CTL Temperature Range Set message

\textbf{Public Members}

uint16_t \texttt{range\_min}  
Value of temperature range min field of light ctl temperature range state

uint16_t \texttt{range\_max}  
Value of temperature range max field of light ctl temperature range state

\textbf{struct esp\_ble\_mesh\_server\_recv\_light\_ctl\_default\_set\_t}  
Context of the received Light CTL Default Set message

\textbf{Public Members}

uint16_t \texttt{lightness}  
Value of light lightness default state

uint16_t \texttt{temperature}  
Value of light temperature default state

int16_t \texttt{delta\_uv}  
Value of light delta UV default state
struct esp_ble_mesh_server_recv_light_hsl_set_t
Context of the received Light HSL Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t lightness
   Target value of light hsl lightness state

uint16_t hue
   Target value of light hsl hue state

uint16_t saturation
   Target value of light hsl saturation state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_hue_set_t
Context of the received Light HSL Hue Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t hue
   Target value of light hsl hue state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_saturation_set_t
Context of the received Light HSL Saturation Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t saturation
   Target value of light hsl hue state

uint8_t tid
   Transaction ID
$	ext{uint8_t} \text{trans_time}$
Time to complete state transition (optional)

$	ext{uint8_t} \text{delay}$
Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_light_hsl_default_set_t**
Context of the received Light HSL Default Set message

**Public Members**

$	ext{uint16_t} \text{lightness}$
Value of light lightness default state

$	ext{uint16_t} \text{hue}$
Value of light hue default state

$	ext{uint16_t} \text{saturation}$
Value of light saturation default state

**struct esp_ble_mesh_server_recv_light_hsl_range_set_t**
Context of the received Light HSL Range Set message

**Public Members**

$	ext{uint16_t} \text{hue_range_min}$
Value of hue range min field of light hsl hue range state

$	ext{uint16_t} \text{hue_range_max}$
Value of hue range max field of light hsl hue range state

$	ext{uint16_t} \text{saturation_range_min}$
Value of saturation range min field of light hsl saturation range state

$	ext{uint16_t} \text{saturation_range_max}$
Value of saturation range max field of light hsl saturation range state

**struct esp_ble_mesh_server_recv_light_xyl_set_t**
Context of the received Light xyL Set message

**Public Members**

$	ext{bool} \text{op_en}$
Indicate whether optional parameters included

$	ext{uint16_t} \text{lightness}$
The target value of the Light xyL Lightness state

$	ext{uint16_t} \text{x}$
The target value of the Light xyL x state

$	ext{uint16_t} \text{y}$
The target value of the Light xyL y state

$	ext{uint8_t} \text{tid}$
Transaction Identifier

$	ext{uint8_t} \text{trans_time}$
Time to complete state transition (optional)
**uint8_t delay**
Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_light_xyl_default_set_t**
Context of the received Light xyL Default Set message

**Public Members**

**uint16_t lightness**
The value of the Light Lightness Default state

**uint16_t x**
The value of the Light xyL x Default state

**uint16_t y**
The value of the Light xyL y Default state

**struct esp_ble_mesh_server_recv_light_xyl_range_set_t**
Context of the received Light xyL Range Set message

**Public Members**

**uint16_t x_range_min**
The value of the xyL x Range Min field of the Light xyL x Range state

**uint16_t x_range_max**
The value of the xyL x Range Max field of the Light xyL x Range state

**uint16_t y_range_min**
The value of the xyL y Range Min field of the Light xyL y Range state

**uint16_t y_range_max**
The value of the xyL y Range Max field of the Light xyL y Range state

**struct esp_ble_mesh_server_recv_light_lc_mode_set_t**
Context of the received Light LC Mode Set message

**Public Members**

**uint8_t mode**
The target value of the Light LC Mode state

**struct esp_ble_mesh_server_recv_light_lc_om_set_t**
Context of the received Light OM Set message

**Public Members**

**uint8_t mode**
The target value of the Light LC Occupancy Mode state

**struct esp_ble_mesh_server_recv_light_lc_light_onoff_set_t**
Context of the received Light LC Light OnOff Set message

2.1. Bluetooth API
Public Members

bool op_en
   Indicate whether optional parameters included

uint8_t light_onoff
   The target value of the Light LC Light OnOff state

uint8_t tid
   Transaction Identifier

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lc_property_set_t
   Context of the received Light LC Property Set message

Public Members

uint16_t property_id
   Property ID identifying a Light LC Property

struct net_buf_simple *property_value
   Raw value for the Light LC Property

struct esp_ble_mesh_server_recv_sensor_status_t
   Context of the received Sensor Status message

Public Members

struct net_buf_simple *data
   Value of sensor data state (optional)

struct esp_ble_mesh_lighting_server_cb_param_t
   Lighting Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
   Pointer to Lighting Server Models

esp_ble_mesh_msg_ctx_t ctx
   Context of the received messages

esp_ble_mesh_lighting_server_cb_value_t value
   Value of the received Lighting Messages

Macros

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI(cli_pub, cli_data)
   Define a new Light Lightness Client Model.
Note This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

Return New Light Lightness Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI (cli_pub, cli_data)
Define a new Light CTL Client Model.

Note This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

Return New Light CTL Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI (cli_pub, cli_data)
Define a new Light HSL Client Model.

Note This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

Return New Light HSL Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI (cli_pub, cli_data)
Define a new Light xyL Client Model.

Note This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

Return New Light xyL Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_LIGHT_LC_CLI (cli_pub, cli_data)
Define a new Light LC Client Model.

Note This API needs to be called for each element on which the application needs to have a Light LC Client Model.

Return New Light LC Client Model instance.

Parameters
Read the Docs Template Documentation, Release v4.1

- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV** (srv_pub, srv_data)

Lighting Server Models related context.

Define a new Light Lightness Server Model.

**Note** 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Light Lightness Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_lightness_srv_t.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV** (srv_pub, srv_data)

Define a new Light Lightness Setup Server Model.

**Note** 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.

1. This model shall support model subscription.

**Return** New Light Lightness Setup Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_lightness_setup_srv_t.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV** (srv_pub, srv_data)

Define a new Light CTL Server Model.

**Note** 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

2. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

**Return** New Light CTL Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_ctl_srv_t.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV** (srv_pub, srv_data)

Define a new Light CTL Setup Server Model.

**Note** 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

2. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

**Return** New Light CTL Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_ctl_srv_t.
Note 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

Return New Light CTL Setup Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_setup_srv_t`.

```
ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV(srv_pub, srv_data)
```

Define a new Light CTL Temperature Server Model.

Note 1. The Light CTL Temperature Server model extends the Generic Level Server model.

1. This model shall support model publication and model subscription.

Return New Light CTL Temperature Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_temp_srv_t`.

```
ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV(srv_pub, srv_data)
```

Define a new Light HSL Server Model.

Note 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

2. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

Return New Light HSL Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_srv_t`.

```
ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV(srv_pub, srv_data)
```

Define a new Light HSL Setup Server Model.

Note 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

Return New Light HSL Setup Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

```
ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV(srv_pub, srv_data)
```

Define a new Light HSL Setup Server Model.
• **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_hsl_setup_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV**(srv_pub, srv_data)

Define a new Light HSL Hue Server Model.

**Note** 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

1. This model shall support model publication and model subscription.

**Return** New Light HSL Hue Server Model instance.

**Parameters**

• **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

• **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_hsl_hue_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV**(srv_pub, srv_data)

Define a new Light HSL Saturation Server Model.

**Note** 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

1. This model shall support model publication and model subscription.

**Return** New Light HSL Saturation Server Model instance.

**Parameters**

• **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

• **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_hsl_sat_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV**(srv_pub, srv_data)

Define a new Light xyL Server Model.

**Note** 1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Light xyL Server Model instance.

**Parameters**

• **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

• **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_xyl_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV**(srv_pub, srv_data)

Define a new Light xyL Setup Server Model.

**Note** 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

**Return** New Light xyL Setup Server Model instance.

**Parameters**

• **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

• **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_xyl_setup_srv_t`. 
**ESP_BLE_MESH_MODEL_LIGHT_LC_SRV** (srv_pub, srv_data)

Define a new Light LC Server Model.

**Note**
1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
   2. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

**Return** New Light LC Server Model instance.

**Parameters**
- *srv_pub*: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- *srv_data*: Pointer to the unique struct `esp_ble_mesh_light_lc_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV** (srv_pub, srv_data)

Define a new Light LC Setup Server Model.

**Note**
1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.
   1. This model shall support model publication and model subscription.
   2. This model may be used to configure setup parameters for the Light LC Server model.

**Return** New Light LC Setup Server Model instance.

**Parameters**
- *srv_pub*: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- *srv_data*: Pointer to the unique struct `esp_ble_mesh_light_lc_setup_srv_t`.

**Type Definitions**

typedef void (*esp_ble_mesh_light_client_cb_t)(esp_ble_mesh_light_client_cb_event_t event, esp_ble_mesh_light_client_cb_param_t *param)

Bluetooth Mesh Light Client Model function.

Lighting Client Model callback function type

**Parameters**
- *event*: Event type
- *param*: Pointer to callback parameter

typedef void (*esp_ble_mesh_lighting_server_cb_t)(esp_ble_mesh_lighting_server_cb_event_t event, esp_ble_mesh_lighting_server_cb_param_t *param)

Bluetooth Mesh Lighting Server Model function.

Lighting Server Model callback function type

**Parameters**
- *event*: Event type
- *param*: Pointer to callback parameter
Enumerations

**enum esp_ble_mesh_light_client_cb_event_t**
This enum value is the event of Lighting Client Model

*Values:*

- ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT
- ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT
- ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT
- ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT
- ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX

**enum esp_ble_mesh_lc_state_t**
This enum value is the Light LC State Machine states

*Values:*

- ESP_BLE_MESH_LC_OFF
- ESP_BLE_MESH_LC_STANDBY
- ESP_BLE_MESH_LC_FADE_ON
- ESP_BLE_MESH_LC_RUN
- ESP_BLE_MESH_LC_FADE
- ESP_BLE_MESH_LC_PROLONG
- ESP_BLE_MESH_LC_FADE_STANDBY_AUTO
- ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL

**enum esp_ble_mesh_lighting_server_cb_event_t**
This enum value is the event of Lighting Server Model

*Values:*

- ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT
  1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Lighting Get messages are received.
  2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

- ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT
  When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Get messages are received.

- ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT
  When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

- ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT
  When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Status message is received.

- ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX
Time and Scenes Client/Server Models

Header File

- bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h

Functions

```c
esp_err_t esp_ble_mesh_register_sensor_client_callback (esp_ble_mesh_sensor_client_cb_t callback)
```

Register BLE Mesh Sensor Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `callback`: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_sensor_client_get_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_get_state_t *get_state)
```

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `params`: Pointer to BLE Mesh common client parameters.
- `get_state`: Pointer to sensor get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_sensor_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_set_state_t *set_state)
```

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `params`: Pointer to BLE Mesh common client parameters.
- `set_state`: Pointer to sensor set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_sensor_server_callback (esp_ble_mesh_sensor_server_cb_t callback)
```

Register BLE Mesh Sensor Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `callback`: Pointer to the callback function.
Unions

union esp_ble_mesh_sensor_client_get_state_t

ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT

Structures

`struct esp_ble_mesh_sensor_descriptor_get_t`
Bluetooth Mesh Sensor Client Model Get and Set parameters structure.

Parameters of Sensor Descriptor Get

`bool op_en`
Indicate if optional parameters are included

`uint16_t property_id`
Property ID of a sensor (optional)

`struct esp_ble_mesh_sensor_cadence_get_t`
Parameter of Sensor Cadence Get

Public Members

`uint16_t property_id`
Property ID of a sensor

`struct esp_ble_mesh_sensor_cadence_set_t`
Parameters of Sensor Cadence Set

Public Members

`uint16_t property_id`
Property ID for the sensor

`uint8_t fast_cadence_period_divisor`
Divisor for the publish period

`uint8_t status_trigger_type`
The unit and format of the Status Trigger Delta fields

`struct net_buf_simple *status_trigger_delta_down`
Delta down value that triggers a status message

`struct net_buf_simple *status_trigger_delta_up`
Delta up value that triggers a status message

`uint8_t status_min_interval`
Minimum interval between two consecutive Status messages
struct net_buf_simple *fast_cadence_low
    Low value for the fast cadence range

struct net_buf_simple *fast_cadence_high
    Fast value for the fast cadence range

struct esp_ble_mesh_sensor_settings_get_t
    Parameter of Sensor Settings Get

Public Members

uint16_t sensor_property_id
    Property ID of a sensor

struct esp_ble_mesh_sensor_setting_get_t
    Parameters of Sensor Setting Get

Public Members

uint16_t sensor_property_id
    Property ID of a sensor

uint16_t sensor_setting_property_id
    Setting ID identifying a setting within a sensor

struct esp_ble_mesh_sensor_setting_set_t
    Parameters of Sensor Setting Set

Public Members

uint16_t sensor_property_id
    Property ID identifying a sensor

uint16_t sensor_setting_property_id
    Setting ID identifying a setting within a sensor

struct net_buf_simple *sensor_setting_raw
    Raw value for the setting

struct esp_ble_mesh_sensor_get_t
    Parameters of Sensor Get

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property ID for the sensor (optional)

struct esp_ble_mesh_sensor_column_get_t
    Parameters of Sensor Column Get

2.1. Bluetooth API
### Public Members

```c
uint16_t property_id
Property identifying a sensor
```

```c
struct net_buf_simple *raw_value_x
Raw value identifying a column
```

#### struct esp_ble_mesh_sensor_series_get_t
Parameters of Sensor Series Get

### Public Members

```c
bool op_en
Indicate if optional parameters are included
```

```c
uint16_t property_id
Property identifying a sensor
```

```c
struct net_buf_simple *raw_value_x1
Raw value identifying a starting column (optional)
```

```c
struct net_buf_simple *raw_value_x2
Raw value identifying an ending column (C.1)
```

#### struct esp_ble_mesh_sensor_descriptor_status_cb_t
Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.

Parameter of Sensor Descriptor Status

### Public Members

```c
struct net_buf_simple *descriptor
Sequence of 8-octet sensor descriptors (optional)
```

#### struct esp_ble_mesh_sensor_cadence_status_cb_t
Parameters of Sensor Cadence Status

### Public Members

```c
uint16_t property_id
Property for the sensor
```

```c
struct net_buf_simple *sensor_cadence_value
Value of sensor cadence state
```

#### struct esp_ble_mesh_sensor_settings_status_cb_t
Parameters of Sensor Settings Status

### Public Members

```c
uint16_t sensor_property_id
Property ID identifying a sensor
```

```c
struct net_buf_simple *sensor_setting_property_ids
A sequence of N sensor setting property IDs (optional)
```
**struct esp_ble_mesh_sensor_setting_status_cb_t**
Parameters of Sensor Setting Status

**Public Members**

bool **op_en**
Indicate if optional parameters are included

uint16_t **sensor_property_id**
Property ID identifying a sensor

uint16_t **sensor_setting_property_id**
Setting ID identifying a setting within a sensor

uint8_t **sensor_setting_access**
Read/Write access rights for the setting (optional)

*struct net_buf_simple* **sensor_setting_raw**
Raw value for the setting

**struct esp_ble_mesh_sensor_status_cb_t**
Parameter of Sensor Status

**Public Members**

*struct net_buf_simple* **marshalled_sensor_data**
Value of sensor data state (optional)

**struct esp_ble_mesh_sensor_column_status_cb_t**
Parameters of Sensor Column Status

**Public Members**

uint16_t **property_id**
Property identifying a sensor and the Y axis

*struct net_buf_simple* **sensor_column_value**
Left values of sensor column status

**struct esp_ble_mesh_sensor_series_status_cb_t**
Parameters of Sensor Series Status

**Public Members**

uint16_t **property_id**
Property identifying a sensor and the Y axis

*struct net_buf_simple* **sensor_series_value**
Left values of sensor series status

**struct esp_ble_mesh_sensor_client_cb_param_t**
Sensor Client Model callback parameters
Public Members

int error_code
0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

*params
esp_ble_mesh_client_common_param_t The client common parameters.

status_cb
esp_ble_mesh_sensor_client_status_cb_t The sensor status message callback values

struct esp_ble_mesh_sensor_descriptor_t
Parameters of Sensor Descriptor state

Public Members

positive_tolerance
uint32_t The value of Sensor Positive Tolerance field

negative_tolerance
uint32_t The value of Sensor Negative Tolerance field

sampling_function
uint32_t The value of Sensor Sampling Function field

measure_period
uint8_t The value of Sensor Measurement Period field

update_interval
uint8_t The value of Sensor Update Interval field

struct esp_ble_mesh_sensor_setting_t
Parameters of Sensor Setting state

Public Members

property_id
uint16_t The value of Sensor Setting Property ID field

access
uint8_t The value of Sensor Setting Access field

*raw
net_buf_simple * The value of Sensor Setting Raw field

struct esp_ble_mesh_sensor_cadence_t
Parameters of Sensor Cadence state

Public Members

period_divisor
uint8_t The value of Fast Cadence Period Divisor field

trigger_type
uint8_t The value of Status Trigger Type field
struct net_buf_simple *trigger_delta_down
Note: The parameter “size” in trigger_delta_down, trigger_delta_up, fast_cadence_low &
fast_cadence_high indicates the exact length of these four parameters, and they are associated with
the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta
Down field

struct net_buf_simple *trigger_delta_up
The value of Status Trigger Delta Up field

uint8_t min_interval
The value of Status Min Interval field

struct net_buf_simple *fast_cadence_low
The value of Fast Cadence Low field

struct net_buf_simple *fast_cadence_high
The value of Fast Cadence High field

struct esp_ble_mesh_sensor_data_t
Parameters of Sensor Data state

Public Members

uint8_t format
Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1 – 16).
Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1 – 127).
The value 0x7F represents a length of zero. The value of the Sensor Data format

uint8_t length
The value of the Sensor Data length

struct net_buf_simple *raw_value
The value of Sensor Data raw value

struct esp_ble_mesh_sensor_series_column_t
Parameters of Sensor Series Column state

Public Members

struct net_buf_simple *raw_value_x
The value of Sensor Raw Value X field

struct net_buf_simple *column_width
The value of Sensor Column Width field

struct net_buf_simple *raw_value_y
The value of Sensor Raw Value Y field

struct esp_ble_mesh_sensor_state_t
Parameters of Sensor states

Public Members

uint16_t sensor_property_id
The value of Sensor Property ID field

esp_ble_mesh_sensor_descriptor_t descriptor
Parameters of the Sensor Descriptor state

2.1. Bluetooth API
const uint8_t setting_count
Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

esp_ble_mesh_sensor_setting_t *settings
Parameters of the Sensor Setting state

esp_ble_mesh_sensor_cadence_t *cadence
The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state

esp_ble_mesh_sensor_data_t sensor_data
Parameters of the Sensor Data state

esp_ble_mesh_sensor_series_column_t series_column
Parameters of the Sensor Series Column state

struct esp_ble_mesh_sensor_srv_t
User data of Sensor Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Sensor Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

const uint8_t state_count
Sensor state count

esp_ble_mesh_sensor_state_t *states
Parameters of the Sensor states

struct esp_ble_mesh_sensor_setup_srv_t
User data of Sensor Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Sensor Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

const uint8_t state_count
Sensor state count

esp_ble_mesh_sensor_state_t *states
Parameters of the Sensor states

struct esp_ble_mesh_state_change_sensor_cadence_set_t
Parameters of Sensor Cadence Set state change event
Public Members

uint16_t property_id
The value of Sensor Property ID state

uint8_t period_divisor
The value of Fast Cadence Period Divisor state

uint8_t trigger_type
The value of Status Trigger Type state

struct net_buf_simple *trigger_delta_down
The value of Status Trigger Delta Down state

struct net_buf_simple *trigger_delta_up
The value of Status Trigger Delta Up state

uint8_t min_interval
The value of Status Min Interval state

struct net_buf_simple *fast_cadence_low
The value of Fast Cadence Low state

struct net_buf_simple *fast_cadence_high
The value of Fast Cadence High state

struct esp_ble_mesh_state_change_sensor_setting_set_t
Parameters of Sensor Setting Set state change event

Public Members

uint16_t property_id
The value of Sensor Property ID state

uint16_t setting_property_id
The value of Sensor Setting Property ID state

struct net_buf_simple *setting_value
The value of Sensor Property Value state

struct esp_ble_mesh_server_recv_sensor_descriptor_get_t
Context of the received Sensor Descriptor Get message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID of a sensor (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_get_t
Context of the received Sensor Cadence Get message

Public Members

uint16_t property_id
Property ID of a sensor
struct esp_ble_mesh_server_recv_sensor_settings_get_t
Context of the received Sensor Settings Get message

Public Members

  uint16_t property_id
  Property ID of a sensor

struct esp_ble_mesh_server_recv_sensor_setting_get_t
Context of the received Sensor Setting Get message

Public Members

  uint16_t property_id
  Property ID of a sensor

  uint16_t setting_property_id
  Setting ID identifying a setting within a sensor

struct esp_ble_mesh_server_recv_sensor_get_t
Context of the received Sensor Get message

Public Members

  bool op_en
  Indicate if optional parameters are included

  uint16_t property_id
  Property ID for the sensor (optional)

struct esp_ble_mesh_server_recv_sensor_column_get_t
Context of the received Sensor Column Get message

Public Members

  uint16_t property_id
  Property identifying a sensor

  struct net_buf_simple *raw_value_x
  Raw value identifying a column

struct esp_ble_mesh_server_recv_sensor_series_get_t
Context of the received Sensor Series Get message

Public Members

  bool op_en
  Indicate if optional parameters are included

  uint16_t property_id
  Property identifying a sensor

  struct net_buf_simple *raw_value
  Raw value containing X1 and X2 (optional)
struct esp_ble_mesh_server_recv_sensor_cadence_set_t
Context of the received Sensor Cadence Set message

Public Members

uint16_t property_id
Property ID for the sensor

struct net_buf_simple *cadence
Value of Sensor Cadence state

struct esp_ble_mesh_server_recv_sensor_setting_set_t
Context of the received Sensor Setting Set message

Public Members

uint16_t property_id
Property ID identifying a sensor

uint16_t setting_property_id
Setting ID identifying a setting within a sensor

struct net_buf_simple *setting_raw
Raw value for the setting

struct esp_ble_mesh_sensor_server_cb_param_t
Sensor Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
Pointer to Sensor Server Models

esp_ble_mesh_msg_ctx_t ctx
Context of the received messages

esp_ble_mesh_sensor_server_cb_value_t value
Value of the received Sensor Messages

Macros

ESP_BLE_MESH_MODEL_SENSOR_CLI (cli_pub, cli_data)
Define a new Sensor Client Model.

Note This API needs to be called for each element on which the application needs to have a Sensor Client Model.

Return New Sensor Client Model instance.

Parameters

• cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data: Pointer to the unique struct esp_ble_mesh_client_t.
ESP_BLE_MESH_MODEL_SENSOR_SRV (srv_pub, srv_data)
Sensor Server Models related context.

Define a new Sensor Server Model.

**Note** 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Sensor Server Model instance.

**Parameters**

- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_sensor_srv_t`.

ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV (srv_pub, srv_data)
Define a new Sensor Setup Server Model.

**Note** 1. The Sensor Setup Server model extends the Sensor Server model.

1. This model shall support model publication and model subscription.

**Return** New Sensor Setup Server Model instance.

**Parameters**

- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_sensor_setup_srv_t`.

ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID
Invalid Sensor Property ID

ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN
Length of Sensor Property ID

ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN
Length of Sensor Descriptor state

ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE
Unspecified Sensor Positive Tolerance

ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE
Unspecified Sensor Negative Tolerance

ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD
Not applicable Sensor Measurement Period

ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL
Not applicable Sensor Update Interval

ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID
Invalid Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN
Length of Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN
Length of Sensor Setting Access
ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ
Sensor Setting Access - Read

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE
Sensor Setting Access - Read & Write

ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN
Length of Sensor Divisor Trigger Type

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN
Length of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE
Maximum value of Sensor Period Divisor

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX
Maximum value of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR
Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16
Sensor Status Trigger Type - Format Type “uint16”

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A
Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B
Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN
MPID length of Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN
MPID length of Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN
Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.

ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT (_data)
Get format of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

Return Format of the sensor data.

Parameters

• _data: Pointer to the start of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH (_data, _fmt)
Get length of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

Return Length (zero-based) of the sensor data.

Parameters

2.1. Bluetooth API
• **_data**: Pointer to the start of the sensor data.
• **_fmt**: Format of the sensor data.

**ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID(_data, _fmt)**
Get Sensor Property ID of the sensor data.

*Note* Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

**Return** Sensor Property ID of the sensor data.

**Parameters**
• **_data**: Pointer to the start of the sensor data.
• **_fmt**: Format of the sensor data.

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID(_len, _id)**
Generate a MPID value for sensor data with Format A.

*Note* 1. The Format field is 0b0 and indicates that Format A is used.
2. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
3. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
4. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.

**Return** 2-octet MPID value for sensor data with Format A.

**Parameters**
• **_len**: Length of Sensor Raw value.
• **_id**: Sensor Property ID.

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID(_len, _id)**
Generate a MPID value for sensor data with Format B.

*Note* 1. The Format field is 0b1 and indicates Format B is used.
2. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
3. The Property ID is a 16-bit bit field representing a Property ID.
4. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
5. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

**Return** 3-octet MPID value for sensor data with Format B.

**Parameters**
• **_len**: Length of Sensor Raw value.
• **_id**: Sensor Property ID.
Type Definitions

typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event, esp_ble_mesh_sensor_client_cb_param_t *param)

Bluetooth Mesh Sensor Client Model function.
Sensor Client Model callback function type

Parameters

• event: Event type
• param: Pointer to callback parameter

typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event, esp_ble_mesh_sensor_server_cb_param_t *param)

Bluetooth Mesh Sensor Server Model function.
Sensor Server Model callback function type

Parameters

• event: Event type
• param: Pointer to callback parameter

Enumerations

enum esp_ble_mesh_sensor_client_cb_event_t
This enum value is the event of Sensor Client Model

Values:

ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX

enum esp_ble_mesh_sensor_sample_func
This enum value is value of Sensor Sampling Function

Values:

ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED
ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS
ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN
ESP_BLE_MESH_SAMPLE_FUNC_RMS
ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM
ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM
ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED
ESP_BLE_MESH_SAMPLE_FUNC_COUNT
enum esp_ble_mesh_sensor_server_cb_event_t

This enum value is the event of Sensor Server Model

Values:

ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT

1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to
   the application layer when Sensor Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to
   the application layer when Sensor Set/Set Unack messages are received.

ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
the application layer when Sensor Get messages are received.

ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the
application layer when Sensor Set/Set Unack messages are received.

ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX

Lighting Client/Server Models

Header File

• bt/esp_ble_mesh/api/models/include/esp_ble_mesh_timeScene_model_api.h

Functions

esp_err_t esp_ble_mesh_register_timeScene_client_callback(esp_ble_mesh_timeScene_client_cb_t callback)

Register BLE Mesh Time Scene Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

• callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_timeScene_client_get_state(esp_ble_mesh_client_common_param_t *params,
                                                esp_ble_mesh_timeScene_client_get_state_t *get_state)

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to
esp_ble_mesh_timeScene_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

• params: Pointer to BLE Mesh common client parameters.
• get_state: Pointer to time scene get message value. Shall not be set to NULL.
esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t *params,
        esp_ble_mesh_time_scene_client_set_state_t *set_state)

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters
• params: Pointer to BLE Mesh common client parameters.
• set_state: Pointer to time scene set message value. Shall not be set to NULL.

esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t callback)

Register BLE Mesh Time and Scenes Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
• callback: Pointer to the callback function.

Structures

- **struct esp_ble_mesh_time_set_t**
  Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

  - **Public Members**
    - `uint8_t tai_seconds[5]`
      The current TAI time in seconds
    - `uint8_t sub_second`
      The sub-second time in units of 1/256 second
    - `uint8_t uncertainty`
      The estimated uncertainty in 10-millisecond steps
    - `uint16_t time_authority`
      0 = No Time Authority, 1 = Time Authority
    - `uint16_t tai_utc_delta`
      Current difference between TAI and UTC in seconds
    - `uint8_t time_zone_offset`
      The local time zone offset in 15-minute increments

- **struct esp_ble_mesh_time_zone_set_t**
  Parameters of Time Zone Set

  - **Public Members**
    - `uint8_t time_zone_offset_new`
      Upcoming local time zone offset
    - `uint8_t tai_zone_change[5]`
      TAI Seconds time of the upcoming Time Zone Offset change

- **struct esp_ble_mesh_tai_utc_delta_set_t**
  Parameters of TAI-UTC Delta Set
Public Members

uint16_t tai_utc_delta_new
Upcoming difference between TAI and UTC in seconds

uint16_t padding
Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_set_t
Parameter of Time Role Set

Public Members

uint8_t time_role
The Time Role for the element

struct esp_ble_mesh_scene_store_t
Parameter of Scene Store

Public Members

uint16_t scene_number
The number of scenes to be stored

struct esp_ble_mesh_scene_recall_t
Parameters of Scene Recall

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t scene_number
The number of scenes to be recalled

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_scene_delete_t
Parameter of Scene Delete

Public Members

uint16_t scene_number
The number of scenes to be deleted

struct esp_ble_mesh_scheduler_act_get_t
Parameter of Scheduler Action Get
**Public Members**

```c
uint8_t index
    Index of the Schedule Register entry to get
```

```c
struct esp_ble_mesh_scheduler_act_set_t
    Parameters of Scheduler Action Set
```

**Public Members**

```c
uint64_t index
    Index of the Schedule Register entry to set
```

```c
uint64_t year
    Scheduled year for the action
```

```c
uint64_t month
    Scheduled month for the action
```

```c
uint64_t day
    Scheduled day of the month for the action
```

```c
uint64_t hour
    Scheduled hour for the action
```

```c
uint64_t minute
    Scheduled minute for the action
```

```c
uint64_t second
    Scheduled second for the action
```

```c
uint64_t day_of_week
    Schedule days of the week for the action
```

```c
uint64_t action
    Action to be performed at the scheduled time
```

```c
uint64_t trans_time
    Transition time for this action
```

```c
uint16_t scene_number
    Transition time for this action
```

**Public Members**

```c
struct esp_ble_mesh_time_status_cb_t
    Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.
```

**Public Members**

```c
uint8_t tai_seconds[5]
    The current TAI time in seconds
```

```c
uint8_t sub_second
    The sub-second time in units of 1/256 second
```

```c
uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps
```

```c
uint16_t time_authority
    0 = No Time Authority, 1 = Time Authority
```
struct esp_ble_mesh_time_zone_status_cb_t
Parameters of Time Zone Status

Public Members

uint8_t time_zone_offset
Current local time zone offset

uint8_t time_zone_offset_new
Upcoming local time zone offset

uint8_t tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_tai_utc_delta_status_cb_t
Parameters of TAI-UTC Delta Status

Public Members

uint16_t tai_utc_delta
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_role_status_cb_t
Parameter of Time Role Status

Public Members

uint8_t time_role
The Time Role for the element

struct esp_ble_mesh_scene_status_cb_t
Parameters of Scene Status

Public Members

bool op_en
Indicate if optional parameters are included
<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>

Appropriate error code

```c
esp_ble_mesh_client_common_param_t *params
```

The client common parameters.

```c
esp_ble_mesh_time_scene_client_status_cb_t status_cb
```

The scene status message callback values

**struct esp_ble_mesh_time_state_t**

Parameters of Time state

#### Public Members

**uint8_t tai_seconds[5]**

The value of the TAI Seconds state

**uint8_t subsecond**

The value of the Subsecond field

**uint8_t uncertainty**

The value of the Uncertainty field

**uint8_t time_zone_offset_curr**

The value of the Time Zone Offset Current field

**uint8_t time_zone_offset_new**

The value of the Time Zone Offset New state

**uint8_t tai_zone_change[5]**

The value of the TAI of Zone Chaneg field

**uint16_t time_authority**

The value of the Time Authority bit

**uint16_t tai_utc_delta_curr**

The value of the TAI-UTC Delta Current state

**uint16_t tai_utc_delta_new**

The value of the TAI-UTC Delta New state

**uint8_t tai_delta_change[5]**

The value of the TAI of Delta Change field

---

2.1. Bluetooth API
struct esp_ble_mesh_time_state_t:
[anonymous] time
Parameters of the Time state

uint8_t time_role
The value of the Time Role state

struct esp_ble_mesh_time_srv_t
User data of Time Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_time_state_t *state
Parameters of the Time state

struct esp_ble_mesh_time_setup_srv_t
User data of Time Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Time Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_time_state_t *state
Parameters of the Time state

struct esp_ble_mesh_scene_register_t

1. Scene Store is an operation of storing values of a present state of an element.
2. The structure and meaning of the stored state is determined by a model. States to be stored are specified
   by each model.
3. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for
   all models present on all elements of a node.
4. If a model is extending another model, the extending model shall determine the Stored with Scene behavior
   of that model.

Parameters of Scene Register state

Public Members

uint16_t scene_number
The value of the Scene Number

uint8_t scene_type
The value of the Scene Type

struct net_buf_simple *scene_value
Scene value may use a union to represent later, the union contains structures of all the model states which
    can be stored in a scene.
    The value of the Scene Value
struct esp_ble_mesh_scenes_state_t
Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

Public Members

const uint16_t scene_count
The Scenes state’s scene count

esp_ble_mesh_scene_register_t *scenes
Parameters of the Scenes state

uint16_t current_scene
The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element’s state that is marked as “Stored with Scene” has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

uint16_t target_scene
The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

uint8_t status_code
The status code of the last scene operation

bool in_progress
Indicate if the scene transition is in progress

struct esp_ble_mesh_scene_srv_t
User data of Scene Server Model

2.1. Bluetooth API
Public Members

`esp_ble_mesh_model_t *model`
- Pointer to the Scene Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
- Response control of the server model received messages

`esp_ble_mesh_scenes_state_t *state`
- Parameters of the Scenes state

`esp_ble_mesh_last_msg_info_t *last`
- Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
- Parameters of state transition

`struct esp_ble_mesh_scene_setup_srv_t`
- User data of Scene Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`
- Pointer to the Scene Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
- Response control of the server model received messages

`esp_ble_mesh_scenes_state_t *state`
- Parameters of the Scenes state

`struct esp_ble_mesh_schedule_register_t`
- Parameters of Scheduler Register state

Public Members

`bool in_use`
- Indicate if the registered schedule is in use

`uint64_t year`
- The value of Scheduled year for the action

`uint64_t month`
- The value of Scheduled month for the action

`uint64_t day`
- The value of Scheduled day of the month for the action

`uint64_t hour`
- The value of Scheduled hour for the action

`uint64_t minute`
- The value of Scheduled minute for the action

`uint64_t second`
- The value of Scheduled second for the action

`uint64_t day_of_week`
- The value of Schedule days of the week for the action
**Public Members**

```c
const uint8_t schedule_count
  Scheduler count
```  

```c
esp_ble_mesh_schedule_register_t *schedules
  Up to 16 scheduled entries
```  

**Public Members**

```c
esp_ble_mesh_model_t *model
  Pointer to the Scheduler Server Model. Initialized internally.
```  

```c
esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
  Response control of the server model received messages
```  

```c
esp_ble_mesh_scheduler_state_t *state
  Parameters of the Scheduler state
```  

**Public Members**

```c
esp_ble_mesh_model_t *model
  Pointer to the Scheduler Setup Server Model. Initialized internally.
```  

```c
esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
  Response control of the server model received messages
```  

```c
esp_ble_mesh_scheduler_state_t *state
  Parameters of the Scheduler state
```  

**Public Members**

```c
uint8_t tai_seconds[5]
  The current TAI time in seconds
```  

---

2.1. Bluetooth API
\textbf{uint8_t subsecond}

The sub-second time in units of 1/256 second

\textbf{uint8_t uncertainty}

The estimated uncertainty in 10-millisecond steps

\textbf{uint16_t time_authority}

0 = No Time Authority, 1 = Time Authority

\textbf{uint16_t tai_utc_delta_curr}

Current difference between TAI and UTC in seconds

\textbf{uint8_t time_zone_offset_curr}

The local time zone offset in 15-minute increments

\textbf{struct esp_ble_mesh_state_change_time_status_t}

Parameters of Time Status state change event

\textbf{Public Members}

\textbf{uint8_t tai_seconds[5]}

The current TAI time in seconds

\textbf{uint8_t subsecond}

The sub-second time in units of 1/256 second

\textbf{uint8_t uncertainty}

The estimated uncertainty in 10-millisecond steps

\textbf{uint16_t time_authority}

0 = No Time Authority, 1 = Time Authority

\textbf{uint16_t tai_utc_delta_curr}

Current difference between TAI and UTC in seconds

\textbf{uint8_t time_zone_offset_curr}

The local time zone offset in 15-minute increments

\textbf{struct esp_ble_mesh_state_change_time_zone_set_t}

Parameters of Time Zone Set state change event

\textbf{Public Members}

\textbf{uint8_t time_zone_offset_new}

Upcoming local time zone offset

\textbf{uint8_t tai_zone_change[5]}

TAI Seconds time of the upcoming Time Zone Offset change

\textbf{struct esp_ble_mesh_state_change_tai_utc_delta_set_t}

Parameters of TAI UTC Delta Set state change event

\textbf{Public Members}

\textbf{uint16_t tai_utc_delta_new}

Upcoming difference between TAI and UTC in seconds

\textbf{uint8_t tai_delta_change[5]}

TAI Seconds time of the upcoming TAI-UTC Delta change
struct esp_ble_mesh_state_change_time_role_set_t
    Parameter of Time Role Set state change event

    Public Members

        uint8_t time_role
            The Time Role for the element

struct esp_ble_mesh_state_change_scene_store_t
    Parameter of Scene Store state change event

    Public Members

        uint16_t scene_number
            The number of scenes to be stored

struct esp_ble_mesh_state_change_scene_recall_t
    Parameter of Scene Recall state change event

    Public Members

        uint16_t scene_number
            The number of scenes to be recalled

struct esp_ble_mesh_state_change_scene_delete_t
    Parameter of Scene Delete state change event

    Public Members

        uint16_t scene_number
            The number of scenes to be deleted

struct esp_ble_mesh_state_change_scheduler_act_set_t
    Parameter of Scheduler Action Set state change event

    Public Members

        uint64_t index
            Index of the Schedule Register entry to set

        uint64_t year
            Scheduled year for the action

        uint64_t month
            Scheduled month for the action

        uint64_t day
            Scheduled day of the month for the action

        uint64_t hour
            Scheduled hour for the action

        uint64_t minute
            Scheduled minute for the action

**Public Members**

\texttt{uint8_t \_index}

Index of the Schedule Register entry to get

**Public Members**

\texttt{uint8_t \_tai\_seconds[5]}

The current TAI time in seconds

\texttt{uint8_t \_subsecond}

The sub-second time in units of 1/256 second

\texttt{uint8_t \_uncertainty}

The estimated uncertainty in 10-millisecond steps

\texttt{uint16_t \_time\_authority}

0 = No Time Authority, 1 = Time Authority

\texttt{uint16_t \_tai\_utc\_delta}

Current difference between TAI and UTC in seconds

\texttt{uint8_t \_time\_zone\_offset}

The local time zone offset in 15-minute increments

**Public Members**

\texttt{uint8_t \_time\_zone\_offset\_new}

Upcoming local time zone offset

\texttt{uint8_t \_tai\_zone\_change[5]}

TAI Seconds time of the upcoming Time Zone Offset change

**Public Members**

\texttt{struct esp\_ble\_mesh\_server\_recv\_time\_zone\_set\_t}

Context of the received Time Zone Set message
Public Members

uint16_t tai_utc_delta_new
Upcoming difference between TAI and UTC in seconds

uint16_t padding
Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_server_recv_time_role_set_t
Context of the received Time Role Set message

Public Members

uint8_t time_role
The Time Role for the element

struct esp_ble_mesh_server_recv_scene_store_t
Context of the received Scene Store message

Public Members

uint16_t scene_number
The number of scenes to be stored

struct esp_ble_mesh_server_recv_scene_recall_t
Context of the received Scene Recall message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t scene_number
The number of scenes to be recalled

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_scene_delete_t
Context of the received Scene Delete message

Public Members

uint16_t scene_number
The number of scenes to be deleted

struct esp_ble_mesh_server_recv_scheduler_act_set_t
Context of the received Scheduler Action Set message

2.1. Bluetooth API
Public Members

uint64_t index
   Index of the Schedule Register entry to set

uint64_t year
   Scheduled year for the action

uint64_t month
   Scheduled month for the action

uint64_t day
   Scheduled day of the month for the action

uint64_t hour
   Scheduled hour for the action

uint64_t minute
   Scheduled minute for the action

uint64_t second
   Scheduled second for the action

uint64_t day_of_week
   Schedule days of the week for the action

uint64_t action
   Action to be performed at the scheduled time

uint64_t trans_time
   Transition time for this action

uint16_t scene_number
   Scene number to be used for some actions

struct esp_ble_mesh_server_recv_time_status_t
   Context of the received Time Status message

Public Members

uint8_t tai_seconds[5]
   The current TAI time in seconds

uint8_t subsecond
   The sub-second time in units of 1/256 second

uint8_t uncertainty
   The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
   0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta
   Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
   The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_scene_server_cb_param_t
   Time Scene Server Model callback parameters
Public Members

\texttt{esp\_ble\_mesh\_model\_t *} \texttt{model}

Pointer to Time and Scenes Server Models

\texttt{esp\_ble\_mesh\_msg\_ctx\_t} \texttt{ctx}

Context of the received messages

\texttt{esp\_ble\_mesh\_time\_scene\_server\_cb\_value\_t} \texttt{value}

Value of the received Time and Scenes Messages

Macros

\textbf{ESP\_BLE\_MESH\_MODEL\_TIME\_CLI} (cli\_pub, cli\_data)

Define a new Time Client Model.

\textbf{Note} This API needs to be called for each element on which the application needs to have a Time Client Model.

\textbf{Return} New Time Client Model instance.

\textbf{Parameters}

- \texttt{cli\_pub}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
- \texttt{cli\_data}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_client\_t}.

\textbf{ESP\_BLE\_MESH\_MODEL\_SCENE\_CLI} (cli\_pub, cli\_data)

Define a new Scene Client Model.

\textbf{Note} This API needs to be called for each element on which the application needs to have a Scene Client Model.

\textbf{Return} New Scene Client Model instance.

\textbf{Parameters}

- \texttt{cli\_pub}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
- \texttt{cli\_data}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_client\_t}.

\textbf{ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_CLI} (cli\_pub, cli\_data)

Define a new Scheduler Client Model.

\textbf{Note} This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

\textbf{Return} New Scheduler Client Model instance.

\textbf{Parameters}

- \texttt{cli\_pub}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
- \texttt{cli\_data}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_client\_t}.

\textbf{ESP\_BLE\_MESH\_MODEL\_TIME\_SRV} (srv\_pub, srv\_data)

Time Scene Server Models related context.

Define a new Time Server Model.

\textbf{Note} 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.
1. This model shall support model publication and model subscription.

Return New Time Server Model instance.

Parameters

- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_time_srv_t`.

ESP_BLE_MESH_MODEL_TIME_SETUP_SRV(srv_data)

Define a new Time Setup Server Model.

Note 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

1. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.

2. This model does not support subscribing nor publishing.

Parameters

- **srv_data**: Pointer to the unique struct `esp_ble_mesh_time_setup_srv_t`.

ESP_BLE_MESH_MODEL_SCENE_SRV(srv_pub, srv_data)

Define a new Scene Server Model.

Note 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

2. The model may be present only on the Primary element of a node.

Return New Scene Server Model instance.

Parameters

- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_scene_srv_t`.

ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV(srv_pub, srv_data)

Define a new Scene Setup Server Model.

Note 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.

1. This model shall support model subscription.

2. The model may be present only on the Primary element of a node.

Return New Scene Setup Server Model instance.

Parameters

- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_scene_setup_srv_t`. 
### ESP_BLE_MESH_MODEL_SCHEDULER_SRV (srv_pub, srv_data)
Define a new Scheduler Server Model.

**Note** 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
   2. The model may be present only on the Primary element of a node.
   3. The model requires the Time Server model shall be present on the element.

**Return** New Scheduler Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scheduler_srv_t`.

### ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV (srv_pub, srv_data)
Define a new Scheduler Setup Server Model.

**Note** 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.
   1. This model shall support model subscription.
   2. The model may be present only on the Primary element of a node.

**Return** New Scheduler Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scheduler_setup_srv_t`.

### ESP_BLE_MESH_UNKNOWN_TAI_SECONDS
Unknown TAI Seconds

### ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE
Unknown TAI of Zone Change

### ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE
Unknown TAI of Delta Change

### ESP_BLE_MESH_TAI_UTC_DELTA_MAX_VALUE
Maximum TAI-UTC Delta value

### ESP_BLE_MESH_TAI_SECONDS_LEN
Length of TAI Seconds

### ESP_BLE_MESH_TAI_OF_ZONE_CHANGE_LEN
Length of TAI of Zone Change

### ESP_BLE_MESH_TAI_OF_DELTA_CHANGE_LEN
Length of TAI of Delta Change

### ESP_BLE_MESH_INVALID_SCENE_NUMBER
Invalid Scene Number

### ESP_BLE_MESH_SCENE_NUMBER_LEN
Length of the Scene Number

---

2.1. Bluetooth API
ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR
Any year of the Scheduled year

ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY
Any day of the Scheduled day

ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR
Any hour of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY
Any hour of the Scheduled Day

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR
Any minute of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_MIN
Every 15 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_MIN
Every 20 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR
Once of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_MIN
Any second of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_SEC
Every 15 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC
Every 20 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN
Once of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF
Scheduled Action - Turn Off

ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON
Scheduled Action - Turn On

ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL
Scheduled Action - Scene Recall

ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION
Scheduled Action - No Action

ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE
Scheduled Scene - No Scene

ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX
Maximum number of Scheduled entries

ESP_BLE_MESH_TIME_NONE
Time Role - None

ESP_BLE_MESH_TIME_AUTHORITY
Time Role - Mesh Time Authority

ESP_BLE_MESH_TIME_RELAY
Time Role - Mesh Time Relay
ESP_BLE_MESH_TIME_CLINET
  Time Role - Mesh Time Client

ESP_BLE_MESH_SCENE_SUCCESS
  Scene operation - Success

ESP_BLE_MESH_SCENE_REG_FULL
  Scene operation - Scene Register Full

ESP_BLE_MESH_SCENE_NOT_FOUND
  Scene operation - Scene Not Found

Type Definitions

typedef void (*esp_ble_mesh_time_scene_client_cb_t)(
  esp_ble_mesh_time_scene_client_cb_event_t event,
  esp_ble_mesh_time_scene_client_cb_param_t *param)

Bluetooth Mesh Time Scene Client Model function.
Time Scene Client Model callback function type

Parameters
  • event: Event type
  • param: Pointer to callback parameter

typedef void (*esp_ble_mesh_time_scene_server_cb_t)(
  esp_ble_mesh_time_scene_server_cb_event_t event,
  esp_ble_mesh_time_scene_server_cb_param_t *param)

Bluetooth Mesh Time and Scenes Server Model function.
Time Scene Server Model callback function type

Parameters
  • event: Event type
  • param: Pointer to callback parameter

Enumerations

define esp_ble_mesh_time_scene_client_cb_event_t
  This enum value is the event of Time Scene Client Model

Values:
  ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT
  ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT
  ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT
  ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT
  ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX

define esp_ble_mesh_time_scene_server_cb_event_t
  This enum value is the event of Time Scene Server Model
Values:

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_STATE\_CHANGE\_EVT**

1. When `get_auto_rsp` is set to ESP\_BLE\_MESH\_SERVER\_AUTO\_RSP, no event will be callback to the application layer when Time Scene Get messages are received.

2. When `set_auto_rsp` is set to ESP\_BLE\_MESH\_SERVER\_AUTO\_RSP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_GET\_MSG\_EVT**

When `get_auto_rsp` is set to ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP, this event will be callback to the application layer when Time Scene Get messages are received.

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_STATUS\_MSG\_EVT**

When `status_auto_rsp` is set to ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP, this event will be callback to the application layer when Time Status message is received.

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_EVT\_MAX**

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice: * For usecases involving classic Bluetooth as well as BLE, Bluedroid should be used. * For BLE-only usecases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

For the overview of the ESP32 Bluetooth stack architecture, follow the links below:

- ESP32 Bluetooth Architecture (PDF) [English]
- ESP32 Bluetooth Architecture (PDF)

Code examples for this API section are provided in the `bluetooth/bluedroid` directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

- GATT Client Example Walkthrough
- GATT Server Service Table Example Walkthrough
- GATT Server Example Walkthrough
- GATT Security Client Example Walkthrough
- GATT Security Server Example Walkthrough
- GATT Client Multi-connection Example Walkthrough

### 2.2 Networking APIs

### 2.2.1 Wi-Fi

Wi-Fi
Introduction

The WiFi libraries provide support for configuring and monitoring the ESP32 WiFi networking functionality. This includes configuration for:

- Station mode (aka STA mode or WiFi client mode). ESP32 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32.
- Combined AP-STA mode (ESP32 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WEP, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 WiFi packets.

Application Examples

The wifi directory of ESP-IDF examples contains the following applications:

- Code examples for Wi-Fi are provided in the wifi directory of ESP-IDF examples.
- In addition, there is a simple esp-idf-template application to demonstrate a minimal IDF project structure.

API Reference

Header File

- esp_wifi/include/esp_wifi.h

Functions

```c
esp_err_t esp_wifi_init(const wifi_init_config_t *config)
```

Init WiFi Alloc resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc, this WiFi also start WiFi task.

**Attention** 1. This API must be called before all other WiFi API can be called

**Attention** 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to init the config to default values, this can guarantee all the fields got correct value when more fields are added into wifi_init_config_t in future release. If you want to set your owner initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT, please be notified that the field ‘magic’ of wifi_init_config_t should always be WIFI_INIT_CONFIG_MAGIC!

**Return**

- ESP_OK: succeed
- ESP_ERR_NO_MEM: out of memory
- others: refer to error code esp_err.h

**Parameters**

- config: pointer to WiFi init configuration structure; can point to a temporary variable.
**esp_err_t esp_wifi_deinit (void)**
Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

**Attention**  1. This API should be called if you want to remove WiFi driver from the system

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_set_mode (wifi_mode_t mode)**
Set the WiFi operating mode.
Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is soft-AP mode.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error code in esp_err.h

**Parameters**
- mode: WiFi operating mode

**esp_err_t esp_wifi_get_mode (wifi_mode_t *mode)**
Get current operating mode of WiFi.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- mode: store current WiFi mode

**esp_err_t esp_wifi_start (void)**
Start WiFi according to current configuration If mode is WIFI_MODE_STA, it create station control block and start station If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP If mode is WIFI_MODE_APSTA, it create soft-AP and station control block and start soft-AP and station.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_FAIL: other WiFi internal errors
**esp_err_t esp_wifi_stop (void)**

Stop WiFi If mode is WIFI_MODE_STA, it stop station and free station control block If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_restore (void)**

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- esp_wifi_get_auto_connect,
- esp_wifi_set_protocol,
- esp_wifi_set_config related
- esp_wifi_set_mode

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_connect (void)**

Connect the ESP32 WiFi station to the AP.

**Attention**

1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.
3. The scanning triggered by esp_wifi_start_scan() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE. If you want to do reconnection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise the called scan will not work. This is especially true when the AP doesn’t exist, and you still try reconnection after ESP32 received disconnect event with the reason code WIFI_REASON_NO_AP_FOUND.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

**esp_err_t esp_wifi_disconnect (void)**

Disconnect the ESP32 WiFi station from the AP.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_FAIL: other WiFi internal errors

```c
esp_err_t esp_wifi_clear_fast_connect(void)
```
Currently this API is just a stub API.

**Return**
- ESP_OK: succeed
- others: fail

```c
esp_err_t esp_wifi_deauth_sta(uint16_t aid)
```
deauthenticate all stations or associated id equals to aid

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

**Parameters**
- `aid`: when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

```c
esp_err_t esp_wifi_scan_start(const wifi_scan_config_t *config, bool block)
```
Scan all available APs.

**Attention** If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause the memory to be freed once the scan is done

**Attention** The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

**Parameters**
- `config`: configuration of scanning
- `block`: if block is true, this API will block the caller until the scan is done, otherwise it will return immediately
esp_err_t esp_wifi_scan_stop (void)
Stop the scan in process.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

esp_err_t esp_wifi_scan_get_ap_num (uint16_t *number)
Get number of APs found in last scan.

Attention This API can only be called when the scan is completed, otherwise it may get wrong value.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
• ESP_ERR_INVALID_ARG: invalid argument

Parameters
• number: store number of APIs found in last scan

esp_err_t esp_wifi_scan_get_ap_records (uint16_t *number, wifi_ap_record_t *ap_records)
Get AP list found in last scan.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_NO_MEM: out of memory

Parameters
• number: As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
• ap_records: wifi_ap_record_t array to hold the found APs

esp_err_t esp_wifi_sta_get_ap_info (wifi_ap_record_t *ap_info)
Get information of AP which the ESP32 station is associated with.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_CONN: The station interface don’t initialized
• ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

Parameters

2.2. Networking APIs
- ap_info: the _wifi_ap_record_t_ to hold AP information sta can get the connected ap’s phy mode info through the struct member phy_11bphy_11gphy_11nphy_lr in the _wifi_ap_record_t_ struct. For example, phy_11b = 1 imply that ap support 802.11b mode.

```c
esp_err_t esp_wifi_set_ps(wifi_ps_type_t type)
```
Set current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Return** ESP_OK: succeed

**Parameters**
- type: power save type

```c
esp_err_t esp_wifi_get_ps(wifi_ps_type_t *type)
```
Get current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Return** ESP_OK: succeed

**Parameters**
- type: store current power save type

```c
esp_err_t esp_wifi_set_protocol(wifi_interface_t ifx, uint8_t protocol_bitmap)
```
Set protocol type of specified interface The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N)

**Attention** Currently we only support 802.11b or 802.11bg or 802.11bgn mode

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interfaces
- protocol_bitmap: WiFi protocol bitmap

```c
esp_err_t esp_wifi_get_protocol(wifi_interface_t ifx, uint8_t *protocol_bitmap)
```
Get the current protocol bitmap of the specified interface.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INV ALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**Parameters**
• `ifx`: interface
• `protocol_bitmap`: store current WiFi protocol bitmap of interface `ifx`

```c
esp_err_t esp_wifi_set_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t bw)
```
Set the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled
**Attention** 2. WIFI_BW_HT40 is supported only when the interface support 11N

**Return**
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_IF: invalid interface
• ESP_ERR_INVALID_ARG: invalid argument
• others: refer to error codes in esp_err.h

**Parameters**
• `ifx`: interface to be configured
• `bw`: bandwidth

```c
esp_err_t esp_wifi_get_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t *bw)
```
Get the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to get a interface that is not enabled

**Return**
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_IF: invalid interface
• ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
• `ifx`: interface to be configured
• `bw`: store bandwidth of interface `ifx`

```c
esp_err_t esp_wifi_set_channel(uint8_t primary, wifi_second_chan_t second)
```
Set primary/secondary channel of ESP32.

**Attention** 1. This API should be called after esp_wifi_start()
**Attention** 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP
**Attention** 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs
**Attention** 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

**Return**
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_IF: invalid interface
• ESP_ERR_INVALID_ARG: invalid argument

Parameters
• primary: for HT20, primary is the channel number, for HT40, primary is the primary channel
• second: for HT20, second is ignored, for HT40, second is the second channel

def esp_wifi_get_channel(uint8_t *primary, wifi_second_chan_t *second)
    Get the primary/secondary channel of ESP32.

Attention 1. API return false if try to get a interface that is not enable

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

Parameters
• primary: store current primary channel
• second: store current second channel

def esp_wifi_set_country(const wifi_country_t *country)
    configure country info

Attention 1. The default country is {.cc="CN", .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO}

Attention 2. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc="USA", .schan=1, .nchan=11} and the country info of the AP to which the station is connected is {.cc="JP", .schan=1, .nchan=14} then the country info that will be used is {.cc="JP", .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back back to the country info of the station automatically, {.cc="US", .schan=1, .nchan=11} in the example.

Attention 3. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, always use the configured country info.

Attention 4. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is changed also.

Attention 5. The country configuration is not stored into flash

Attention 6. This API doesn’t validate the per-country rules, it’s up to the user to fill in all fields according to local regulations.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
Parameters

- `country`: the configured country info

```c
esp_err_t esp_wifi_get_country(wifi_country_t *country)
```
get the current country info

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- `country`: country info

```c
esp_err_t esp_wifi_set_mac(wifi_interface_t ifx, const uint8_t mac[6])
```
Set MAC address of the ESP32 WiFi station or the soft-AP interface.

**Attention**

1. This API can only be called when the interface is disabled
2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.
3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX”, but can not be “15:XX:XX:XX:XX:XX”.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MAC: invalid mac address
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- others: refer to error codes in esp_err.h

Parameters

- `ifx`: interface
- `mac`: the MAC address

```c
esp_err_t esp_wifi_get_mac(wifi_interface_t ifx, uint8_t mac[6])
```
Get mac of specified interface.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

Parameters
• ifx: interface
• mac: store mac of the interface ifx

```c
esp_err_t esp_wifi_set_promiscuous_rx_cb(wifi_promiscuous_cb_t cb)
```

Register the RX callback function in the promiscuous mode.
Each time a packet is received, the registered callback function will be called.

**Return**
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
• cb: callback

```c
esp_err_t esp_wifi_set_promiscuous(bool en)
```

Enable the promiscuous mode.

**Return**
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
• en: false - disable, true - enable

```c
esp_err_t esp_wifi_get_promiscuous(bool *en)
```

Get the promiscuous mode.

**Return**
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
• en: store the current status of promiscuous mode

```c
esp_err_t esp_wifi_set_promiscuous_filter(const wifi_promiscuous_filter_t *filter)
```

Enable the promiscuous mode packet type filter.

**Note** The default filter is to filter all packets except WIFI_PKT_MISC

**Return**
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
• filter: the packet type filtered in promiscuous mode.

```c
esp_err_t esp_wifi_get_promiscuous_filter(wifi_promiscuous_filter_t *filter)
```

Get the promiscuous filter.
Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- filter: store the current status of promiscuous filter

```c
esp_err_t esp_wifi_set_promiscuous_ctrl_filter(const wifi_promiscuous_filter_t *filter)
```

Enable subtype filter of the control packet in promiscuous mode.

Note The default filter is to filter none control packet.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters

- filter: the subtype of the control packet filtered in promiscuous mode.

```c
esp_err_t esp_wifi_get_promiscuous_ctrl_filter(wifi_promiscuous_filter_t *filter)
```

Get the subtype filter of the control packet in promiscuous mode.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters

- filter: store the current status of subtype filter of the control packet in promiscuous mode

```c
esp_err_t esp_wifi_set_config(wifi_interface_t interface, wifi_config_t *conf)
```

Set the configuration of the ESP32 STA or AP.

Attention 1. This API can be called only when specified interface is enabled, otherwise, API fail

Attention 2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

Attention 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
• ESP_ERR_WIFI_NVS: WiFi internal NVS error
• others: refer to the erro code in esp_err.h

Parameters
• interface: interface
• conf: station or soft-AP configuration

```c
esp_err_t esp_wifi_get_config(wifi_interface_t interface, wifi_config_t *conf)
```
Get configuration of specified interface.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_WIFI_IF: invalid interface

Parameters
• interface: interface
• conf: station or soft-AP configuration

```c
esp_err_t esp_wifi_ap_get_sta_list(wifi_sta_list_t *sta)
```
Get STAs associated with soft-AP.

Attention SSC only API

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_WIFI_MODE: WiFi mode is wrong
• ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

Parameters
• sta: station list ap can get the connected sta’s phy mode info through the struct member phy_11bphy_11gphy_11nphy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

```c
esp_err_t esp_wifi_ap_get_sta_aid(const uint8_t mac[6], uint16_t *aid)
```
Get AID of STA connected with soft-AP.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_NOT_FOUND: Requested resource not found
• ESP_ERR_WIFI_MODE: WiFi mode is wrong
• ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

Parameters
• mac: STA’s mac address
• aid: Store the AID corresponding to STA mac

```
esp_err_t esp_wifi_set_storage(wifi_storage_t storage)
```

Set the WiFi API configuration storage type.

Attention 1. The default value is WIFI_STORAGE_FLASH

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

Parameters
• storage: storage type

```
esp_err_t esp_wifi_set_vendor_ie(bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)
```

Set 802.11 Vendor-Specific Information Element.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
• ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
• ESP_ERR_NO_MEM: Out of memory

Parameters
• enable: If true, specified IE is enabled. If false, specified IE is removed.
• type: Information Element type. Determines the frame type to associate with the IE.
• idx: Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
• vnd_ie: Pointer to vendor specific element data. First 6 bytes should be a header with fields matching vendor_ie_data_t. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

```
esp_err_t esp_wifi_set_vendor_ie_cb(esp_vendor_ie_cb_t cb, void *ctx)
```

Register Vendor-Specific Information Element monitoring callback.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
• cb: Callback function
• ctx: Context argument, passed to callback function.
**esp_err_t esp_wifi_set_max_tx_power (int8_t power)**

Set maximum transmitting power after WiFi start.

**Attention** 1. Maximum power before wifi startup is limited by PHY init data bin.

**Attention** 2. The value set by this API will be mapped to the `max_tx_power` of the structure `wifi_country_t` variable.

**Attention** 3. Mapping Table `{Power, max_tx_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {78, 20}}`.

**Attention** 4. Param power unit is 0.25dBm, range is [8, 78] corresponding to 2dBm - 20dBm.

**Attention** 5. Relationship between set value and actual value. As follows:

```
<table>
<thead>
<tr>
<th>set value</th>
<th>actual value</th>
</tr>
</thead>
<tbody>
<tr>
<td>[8, 78]</td>
<td>8</td>
</tr>
</tbody>
</table>
```

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is out of range

**Parameters**

- `power`: Maximum WiFi transmitting power.

**esp_err_t esp_wifi_get_max_tx_power (int8_t *power)**

Get maximum transmitting power after WiFi start.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument

**Parameters**

- `power`: Maximum WiFi transmitting power, unit is 0.25dBm.

**esp_err_t esp_wifi_set_event_mask (uint32_t mask)**

Set mask to enable or disable some WiFi events.

**Attention** 1. Mask can be created by logical OR of various WIFI_EVENT_MASK_ constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

**Attention** 2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRECVED.

**Attention** 3. There may be lots of stations sending probe request data around. Don’t unmask this event unless you need to receive probe request data.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument

**Parameters**

- `mask`: WiFi event mask.
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
• `mask`: WiFi event mask.

`esp_err_t esp_wifi_get_event_mask(uint32_t *mask)`
Get mask of WiFi events.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument

Parameters
• `mask`: WiFi event mask.

`esp_err_t esp_wifi_80211_tx(wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)`
Send raw ieee80211 data.

Attention Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

Return
• ESP_OK: success
• ESP_ERR_WIFI_IF: Invalid interface
• ESP_ERR_INVALID_ARG: Invalid parameter
• ESP_ERR_WIFI_NO_MEM: out of memory

Parameters
• `ifx`: interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
• `buffer`: raw 80211 buffer
• `len`: the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
• `en_sys_seq`: indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq=false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_WIFI_ARG is returned.

`esp_err_t esp_wifi_set_csi_rx_cb(wifi_csi_cb_t cb, void *ctx)`
Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

Return
• ESP_OK: succeed

2.2. Networking APIs
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
- cb: callback
- ctx: context argument, passed to callback function

```c
esp_err_t esp_wifi_set_csi_config(const wifi_csi_config_t *config)
```
Set CSI data configuration.

```c
return
```
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- config: configuration

```c
esp_err_t esp_wifi_set_csi(bool en)
```
Enable or disable CSI.

```c
return
```
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- en: true - enable, false - disable

```c
esp_err_t esp_wifi_set_ant_gpio(const wifi_ant_gpio_config_t *config)
```
Set antenna GPIO configuration.

```c
return
```
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

Parameters
- config: Antenna GPIO configuration.

```c
esp_err_t esp_wifi_get_ant_gpio(wifi_ant_gpio_config_t *config)
```
Get current antenna GPIO configuration.

```c
return
```
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

Parameters
• config: Antenna GPIO configuration.

`esp_err_t esp_wifi_set_ant(const wifi_ant_config_t *config)`
Set antenna configuration.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

Parameters
• config: Antenna configuration.

`esp_err_t esp_wifi_get_ant(wifi_ant_config_t *config)`
Get current antenna configuration.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

Parameters
• config: Antenna configuration.

Structures

`struct wifi_init_config_t`  
WiFi stack configuration parameters passed to esp_wifi_init call.

Public Members

`system_event_handler_t event_handler`  
WiFi event handler

`wifi_osi_funcs_t *osi_funcs`  
WiFi OS functions

`wpa_crypto_funcs_t wpa_crypto_funcs`  
WiFi station crypto functions when connect

`int static_rx_buf_num`  
WiFi static RX buffer number

`int dynamic_rx_buf_num`  
WiFi dynamic RX buffer number

`int tx_buf_type`  
WiFi TX buffer type
int static_tx_buf_num
    WiFi static TX buffer number

int dynamic_tx_buf_num
    WiFi dynamic TX buffer number

int csi_enable
    WiFi channel state information enable flag

int ampdu_rx_enable
    WiFi AMPDU RX feature enable flag

int ampdu_tx_enable
    WiFi AMPDU TX feature enable flag

int nvs_enable
    WiFi NVS flash enable flag

int nano_enable
    Nano option for printf/scan family enable flag

int tx_ba_win
    WiFi Block Ack TX window size

int rx_ba_win
    WiFi Block Ack RX window size

int wifi_task_core_id
    WiFi Task Core ID

int beacon_max_len
    WiFi softAP maximum length of the beacon

int mgmt_sbuf_num
    WiFi management short buffer number, the minimum value is 6, the maximum value is 32

uint64_t feature_caps
    Enables additional WiFi features and capabilities

int magic
    WiFi init magic number, it should be the last field

**Macros**

**ESP_ERR_WIFI_NOT_INIT**
    WiFi driver was not installed by esp_wifi_init

**ESP_ERR_WIFI_NOT_STARTED**
    WiFi driver was not started by esp_wifi_start

**ESP_ERR_WIFI_NOT_STOPPED**
    WiFi driver was not stopped by esp_wifi_stop

**ESP_ERR_WIFI_IF**
    WiFi interface error

**ESP_ERR_WIFI_MODE**
    WiFi mode error

**ESP_ERR_WIFI_STATE**
    WiFi internal state error
ESP_ERR_WIFI_CONN
WiFi internal control block of station or soft-AP error

ESP_ERR_WIFI_NVS
WiFi internal NVS module error

ESP_ERR_WIFI_MAC
MAC address is invalid

ESP_ERR_WIFI_SSID
SSID is invalid

ESP_ERR_WIFI_PASSWORD
Password is invalid

ESP_ERR_WIFI_TIMEOUT
Timeout error

ESP_ERR_WIFI_WAKE_FAIL
WiFi is in sleep state (RF closed) and wakeup fail

ESP_ERR_WIFI_WOULD_BLOCK
The caller would block

ESP_ERR_WIFI_NOT_CONNECT
Station still in disconnect status

ESP_ERR_WIFI_POST
Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE
Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE
Returned when WiFi is stopping

WIFI_STATIC_TX_BUFFER_NUM
WIFI_DYNAMIC_TX_BUFFER_NUM
WIFI_CSI_ENABLED
WIFI_AMPDU_RX_ENABLED
WIFI_AMPDU_TX_ENABLED
WIFI_NVS_ENABLED

WIFI_INIT_CONFIG_DEFAULT()
Type Definitions

typedef void (*wifi_promiscuous_cb_t)(void *buf, wifi_promiscuous_pkt_type_t type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

Parameters

• buf: Data received. Type of data in buffer (wifi_promiscuous_pkt_t or wifi_pkt_rx_ctrl_t) indicated by ‘type’ parameter.
• type: promiscuous packet type.

typedef void (*esp_vendor_ie_cb_t)(void *ctx, wifi_vendor_ie_type_t type, const uint8_t sa[6],
const vendor_ie_data_t *vnd_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

Parameters

• ctx: Context argument, as passed to esp_wifi_set_vendor_ie_cb() when registering callback.
• type: Information element type, based on frame type received.
• sa: Source 802.11 address.
• vnd_ie: Pointer to the vendor specific element data received.
• rssi: Received signal strength indication.

typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.

Parameters

• ctx: context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.
• data: CSI data received. The memory that it points to will be deallocated after callback function returns.

Header File

• esp_wifi/include/esp_wifi_types.h

Unions

union wifi_config_t

#include <esp_wifi_types.h> Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to esp_wifi_set_config() or esp_wifi_get_config()
Public Members

*wifi_ap_config_t* `ap`
configuration of AP

*wifi_sta_config_t* `sta`
configuration of STA

Structures

```c
struct wifi_country_t
```
Structure describing WiFi country-based regional restrictions.

Public Members

- `char cc[3]`  
  country code string

- `uint8_t schan`  
  start channel

- `uint8_t nchan`  
  total channel number

- `int8_t max_tx_power`  
  This field is used for getting WiFi maximum transmitting power, call `esp_wifi_set_max_tx_power` to set the maximum transmitting power.

```c
struct wifi_country_policy_t policy
```
country policy

**struct wifi_active_scan_time_t**
Range of active scan times per channel.

Public Members

- `uint32_t min`  
  minimum active scan time per channel, units: millisecond

- `uint32_t max`  
  maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

**struct wifi_scan_time_t**
Aggregate of active & passive scan time per channel.

Public Members

```c
wifi_active_scan_time_t active
```
active scan time per channel, units: millisecond.

```c
uint32_t passive
```
passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

2.2. Networking APIs
struct wifi_scan_config_t
Parameters for an SSID scan.

Public Members

uint8_t *ssid
SSID of AP

uint8_t *bssid
MAC address of AP

uint8_t channel
channel, scan the specific channel

bool show_hidden
enable to scan AP whose SSID is hidden

wifi_scan_type_t scan_type
scan type, active or passive

wifi_scan_time_t scan_time
scan time per channel

struct wifi_ap_record_t
Description of a WiFi AP.

Public Members

uint8_t bssid[6]
MAC address of AP

uint8_t ssid[33]
SSID of AP

uint8_t primary
channel of AP

wifi_second_chan_t second
secondary channel of AP

int8_t rssi
signal strength of AP

wifi_auth_mode_t authmode
authmode of AP

wifi_cipher_type_t pairwise_cipher
pairwise cipher of AP

wifi_cipher_type_t group_cipher
group cipher of AP

wifi_ant_t ant
antenna used to receive beacon from AP

uint32_t phy_11b
bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g
bit: 1 flag to identify if 11g mode is enabled or not
uint32_t phy_11n
   bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr
   bit: 3 flag to identify if low rate is enabled or not

uint32_t wps
   bit: 4 flag to identify if WPS is supported or not

uint32_t reserved
   bit: 5..31 reserved

wifi_country_t country
   country information of AP

struct wifi_scan_threshold_t
   Structure describing parameters for a WiFi fast scan.

   Public Members

   int8_t rssi
      The minimum rssi to accept in the fast scan mode

   wifi_auth_mode_t authmode
      The weakest authmode to accept in the fast scan mode

struct wifi_pmf_config_t
   Configuration structure for Protected Management Frame

   Public Members

   bool capable
      Advertizes support for Protected Management Frame. Device will prefer to connect in PMF mode if other
device also advertizes PMF capability.

   bool required
      Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable
devices.

struct wifi_ap_config_t
   Soft-AP configuration settings for the ESP32.

   Public Members

   uint8_t ssid[32]
      SSID of ESP32 soft-AP. If ssid_len field is 0, this must be a Null terminated string. Otherwise, length is
set according to ssid_len.

   uint8_t password[64]
      Password of ESP32 soft-AP. Null terminated string.

   uint8_t ssid_len
      Optional length of SSID field.

   uint8_t channel
      Channel of ESP32 soft-AP

2.2. Networking APIs
**wifi_auth_mode_t authmode**
Auth mode of ESP32 soft-AP. Do not support AUTH_WEP in soft-AP mode

**uint8_t ssid_hidden**
Broadcast SSID or not, default 0, broadcast the SSID

**uint8_t max_connection**
Max number of stations allowed to connect in, default 4, max 10

**uint16_t beacon_interval**
Beacon interval, 100 ~ 60000 ms, default 100 ms

**struct wifi_sta_config_t**
STA configuration settings for the ESP32.

**Public Members**

**uint8_t ssid[32]**
SSID of target AP. Null terminated string.

**uint8_t password[64]**
Password of target AP. Null terminated string.

**wifi_scan_method_t scan_method**
do all channel scan or fast scan

**bool bssid_set**
whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

**uint8_t bssid[6]**
MAC address of target AP

**uint8_t channel**
channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

**uint16_t listen_interval**
Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

**wifi_sort_method_t sort_method**
sort the connect AP in the list by rssi or security mode

**wifi_scan_threshold_t threshold**
When sort_method is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

**wifi_pmf_config_t pmf_cfg**
Configuration for Protected Management Frame. Will be advertized in RSN Capabilities in RSN IE.

**struct wifi_sta_info_t**
Description of STA associated with AP.

**Public Members**

**uint8_t mac[6]**
mac address
int8_t rssi
current average rssi of sta connected

uint32_t phy_11b
bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g
bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n
bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr
bit: 3 flag to identify if low rate is enabled or not

uint32_t reserved
bit: 4..31 reserved

struct wifi_sta_list_t
List of stations associated with the ESP32 Soft-AP.

Public Members

wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]
station list

int num
number of stations in the list (other entries are invalid)

struct vendor_ie_data_t
Vendor Information Element header.
The first bytes of the Information Element will match this header. Payload follows.

Public Members

uint8_t element_id
Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

uint8_t length
Length of all bytes in the element data following this field. Minimum 4.

uint8_t vendor_oui[3]
Vendor identifier (OUI).

uint8_t vendor_oui_type
Vendor-specific OUI type.

uint8_t payload[0]
Payload. Length is equal to value in ‘length’ field, minus 4.

struct wifi_pkt_rx_ctrl_t
Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

Public Members

signed rssi
Received Signal Strength Indicator(RSSI) of packet. unit: dBm

2.2. Networking APIs
unsigned rate
PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned __pad0__
reserve

unsigned sig_mode
0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned __pad1__
reserve

unsigned mcs
Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MCS0 ~ MCS76)

unsigned cwb
Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned __pad2__
reserve

unsigned smoothing
reserve

unsigned not_sounding
reserve

unsigned __pad3__
reserve

unsigned aggregation
Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned stbc
Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned fec_coding
Flag is set for 11n packets which are LDPC

unsigned sgi
Short Guide Interval(SGI). 0: Long GI; 1: Short GI

unsigned ampdu_cnt
ampdu cnt

unsigned channel
primary channel on which this packet is received

unsigned secondary_channel
secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned __pad4__
reserve

unsigned timestamp
timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned __pad5__
reserve

unsigned __pad6__
reserve
unsigned \texttt{ant} \\
\quad \text{antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1}

unsigned \texttt{sig\_len} \\
\quad \text{length of packet including Frame Check Sequence(FCS)}

unsigned \texttt{\_pad7\_} \\
\quad \text{reserve}

unsigned \texttt{rx\_state} \\
\quad \text{state of the packet. 0: no error; others: error numbers which are not public}

\textbf{struct wifi\_promiscuous\_pkt\_t} \\
\quad \text{Payload passed to ‘buf’ parameter of promiscuous mode RX callback.}

\textbf{Public Members}

\begin{itemize}
\item \texttt{wifi\_pkt\_rx\_ctrl\_t rx\_ctrl} \\
\quad \text{metadata header}
\item \texttt{uint8\_t payload[0]} \\
\quad \text{Data or management payload. Length of payload is described by \texttt{rx\_ctrl.sig\_len}. Type of content determined by packet type argument of callback.}
\end{itemize}

\textbf{struct wifi\_promiscuous\_filter\_t} \\
\quad \text{Mask for filtering different packet types in promiscuous mode.}

\textbf{Public Members}

\begin{itemize}
\item \texttt{uint32\_t filter\_mask} \\
\quad \text{OR of one or more filter values WIFI\_PROMIS\_FILTER\_*}
\end{itemize}

\textbf{struct wifi\_csi\_config\_t} \\
\quad \text{Channel state information(CSI) configuration type.}

\textbf{Public Members}

\begin{itemize}
\item \texttt{bool lltf\_en} \\
\quad \text{enable to receive legacy long training field(lltf) data. Default enabled}
\item \texttt{bool htltf\_en} \\
\quad \text{enable to receive HT long training field(htltf) data. Default enabled}
\item \texttt{bool stbc\_htltf2\_en} \\
\quad \text{enable to receive space time block code HT long training field(stbc-htltf2) data. Default enabled}
\item \texttt{bool ltf\_merge\_en} \\
\quad \text{enable to generate htlft data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled}
\item \texttt{bool channel\_filter\_en} \\
\quad \text{enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled}
\item \texttt{bool manu\_scale} \\
\quad \text{manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false}
\end{itemize}
**struct wifi_csi_info_t**

CSI data type.

*Public Members*

- `wifi_pkt_rx_ctrl_t rx_ctrl`
  
  received packet radio metadata header of the CSI data

- `uint8_t mac[6]`
  
  source MAC address of the CSI data

- `bool first_word_invalid`
  
  first four bytes of the CSI data is invalid or not

- `int8_t *buf`
  
  buffer of CSI data

- `uint16_t len`
  
  length of CSI data

**struct wifi_ant_gpio_t**

WiFi GPIO configuration for antenna selection.

*Public Members*

- `uint8_t gpio_select`
  
  Whether this GPIO is connected to external antenna switch

- `uint8_t gpio_num`
  
  The GPIO number that connects to external antenna switch

**struct wifi_ant_gpio_config_t**

WiFi GPIOs configuration for antenna selection.

*Public Members*

- `wifi_ant_gpio_t gpio_cfg[4]`
  
  The configurations of GPIOs that connect to external antenna switch

**struct wifi_ant_config_t**

WiFi antenna configuration.

*Public Members*

- `wifi_ant_mode_t rx_ant_mode`
  
  WiFi antenna mode for receiving

- `wifi_ant_t rx_ant_default`
  
  Default antenna mode for receiving, it’s ignored if `rx_ant_mode` is not WIFI_ANT_MODE_AUTO

- `wifi_ant_mode_t tx_ant_mode`
  
  WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if `rx_ant_mode` is set to WIFI_ANT_MODE.AUTO

```c
uint8_t shift

manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15
```
uint8_t enabled_ant0
    Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

uint8_t enabled_ant1
    Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

struct wifi_event_sta_scan_done_t
    Argument structure for WIFI_EVENT_SCAN_DONE event

Public Members

uint32_t status
    status of scanning APs: 0 — success, 1 - failure

uint8_t number
    number of scan results

uint8_t scan_id
    scan sequence number, used for block scan

struct wifi_event_sta_connected_t
    Argument structure for WIFI_EVENT_STA_CONNECTED event

Public Members

uint8_t ssid[32]
    SSID of connected AP

uint8_t ssid_len
    SSID length of connected AP

uint8_t bssid[6]
    BSSID of connected AP

uint8_t channel
    channel of connected AP

wifi_auth_mode_t authmode
    authentication mode used by AP

struct wifi_event_sta_disconnected_t
    Argument structure for WIFI_EVENT_STA_DISCONNECTED event

Public Members

uint8_t ssid[32]
    SSID of disconnected AP

uint8_t ssid_len
    SSID length of disconnected AP

uint8_t bssid[6]
    BSSID of disconnected AP

uint8_t reason
    reason of disconnection

struct wifi_event_sta_authmode_change_t
    Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event
Public Members

`wifi_auth_mode_t old_mode`
the old auth mode of AP

`wifi_auth_mode_t new_mode`
the new auth mode of AP

`struct wifi_event_sta_wps_er_pin_t`
Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

Public Members

`uint8_t pin_code[8]`
PIN code of station in enrollee mode

`struct wifi_event_ap_staconnected_t`
Argument structure for WIFI_EVENT_AP_STACONNECTED event

Public Members

`uint8_t mac[6]`
MAC address of the station connected to ESP32 soft-AP

`uint8_t aid`
the aid that ESP32 soft-AP gives to the station connected to

`struct wifi_event_ap_stadisconnected_t`
Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

Public Members

`uint8_t mac[6]`
MAC address of the station disconnects to ESP32 soft-AP

`uint8_t aid`
the aid that ESP32 soft-AP gave to the station disconnects to

`struct wifi_event_ap_probe_req_rx_t`
Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

Public Members

`int rssi`
Received probe request signal strength

`uint8_t mac[6]`
MAC address of the station which send probe request

Macros

`WIFI_IF_STA`

`WIFI_IF_AP`
WIFI_PROTOCOL_11B
WIFI_PROTOCOL_11G
WIFI_PROTOCOL_11N
WIFI_PROTOCOL_LR

ESP_WIFI_MAX_CONN_NUM
max number of stations which can connect to ESP32 soft-AP

WIFI_VENDOR_IE_ELEMENT_ID

WIFI_PROMIS_FILTER_MASK_ALL
filter all packets

WIFI_PROMIS_FILTER_MASK_MGMT
filter the packets with type of WIFI_PKT_MGMT

WIFI_PROMIS_FILTER_MASK_CTRL
filter the packets with type of WIFI_PKT_CTRL

WIFI_PROMIS_FILTER_MASK_DATA
filter the packets with type of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_MISC
filter the packets with type of WIFI_PKT_MISC

WIFI_PROMIS_FILTER_MASK_DATA_MPDU
filter the MPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_DATA_AMPDU
filter the AMPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_CTRL_FILTER_MASK_ALL
filter all control packets

WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER
filter the control packets with subtype of Control Wrapper

WIFI_PROMIS_CTRL_FILTER_MASK_BAR
filter the control packets with subtype of Block Ack Request

WIFI_PROMIS_CTRL_FILTER_MASK_BA
filter the control packets with subtype of Block Ack

WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL
filter the control packets with subtype of PS-Poll

WIFI_PROMIS_CTRL_FILTER_MASK_RTS
filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS
filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK
filter the control packets with subtype of ACK

WIFI_PROMIS_CTRL_FILTER_MASK_CFEND
filter the control packets with subtype of CF-END

WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK
filter the control packets with subtype of CF-END+CF-ACK

2.2. Networking APIs
**WIFI_EVENT_MASK_ALL**
mask all WiFi events

**WIFI_EVENT_MASK_NONE**
mask none of the WiFi events

**WIFI_EVENT_MASK_AP_PROBEREQRECVED**
mask SYSTEM_EVENT_AP_PROBEREQRECVED event

**Type Definitions**

typedef esp_interface_t wifi_interface_t

**Enumerations**

class wifi_mode_t

    Values:
    
    WIFI_MODE_NULL = 0
    null mode

    WIFI_MODE_STA
    WiFi station mode

    WIFI_MODE_AP
    WiFi soft-AP mode

    WIFI_MODE_APSTA
    WiFi station + soft-AP mode

    WIFI_MODE_MAX

enum wifi_country_policy_t

    Values:
    
    WIFI_COUNTRY_POLICY_AUTO
    Country policy is auto, use the country info of AP to which the station is connected

    WIFI_COUNTRY_POLICY_MANUAL
    Country policy is manual, always use the configured country info

enum wifi_auth_mode_t

    Values:
    
    WIFI_AUTH_OPEN = 0
    authenticate mode : open

    WIFI_AUTH_WEP
    authenticate mode : WEP

    WIFI_AUTH_WPA_PSK
    authenticate mode : WPA_PSK

    WIFI_AUTH_WPA2_PSK
    authenticate mode : WPA2_PSK

    WIFI_AUTH_WPA_WPA2_PSK
    authenticate mode : WPA_WPA2_PSK
WIFI_AUTH_WPA2_ENTERPRISE
authenticate mode : WPA2_ENTERPRISE

WIFI_AUTH_WPA3_PSK
authenticate mode : WPA3_PSK

WIFI_AUTH_WPA2_WPA3_PSK
authenticate mode : WPA2_WPA3_PSK

WIFI_AUTH_MAX

2.2. Networking APIs
WIFI_REASON_HANDSHAKE_TIMEOUT = 204
WIFI_REASON_CONNECTION_FAIL = 205

definition of wifi_second_chan_t
Values:

WIFI_SECOND_CHAN_NONE = 0
the channel width is HT20

WIFI_SECOND_CHAN_ABOVE
the channel width is HT40 and the secondary channel is above the primary channel

WIFI_SECOND_CHAN_BELOW
the channel width is HT40 and the secondary channel is below the primary channel

definition of wifi_scan_type_t
Values:

WIFI_SCAN_TYPE_ACTIVE = 0
active scan

WIFI_SCAN_TYPE_PASSIVE
passive scan

definition of wifi_cipher_type_t
Values:

WIFI_CIPHER_TYPE_NONE = 0
the cipher type is none

WIFI_CIPHER_TYPE_WEP40
the cipher type is WEP40

WIFI_CIPHER_TYPE_WEP104
the cipher type is WEP104

WIFI_CIPHER_TYPE_TKIP
the cipher type is TKIP

WIFI_CIPHER_TYPE_CCMP
the cipher type is CCMP

WIFI_CIPHER_TYPE_TKIP_CCMP
the cipher type is TKIP and CCMP

WIFI_CIPHER_TYPE_AES_CMAC128
the cipher type is AES-CMAC-128

WIFI_CIPHER_TYPE_UNKNOWN
the cipher type is unknown

definition of wifi_ant_t
WiFi antenna.
Values:

WIFI_ANT_ANT0
WiFi antenna 0

WIFI_ANT_ANT1
WiFi antenna 1

WIFI_ANT_MAX
Invalid WiFi antenna
enum wifi_scan_method_t
Values:

WIFI_FAST_SCAN = 0
Do fast scan, scan will end after find SSID match AP

WIFI_ALL_CHANNEL_SCAN
All channel scan, scan will end after scan all the channel

enum wifi_sort_method_t
Values:

WIFI_CONNECT_AP_BY_SIGNAL = 0
Sort match AP in scan list by RSSI

WIFI_CONNECT_AP_BY_SECURITY
Sort match AP in scan list by security mode

enum wifi_ps_type_t
Values:

WIFI_PS_NONE
No power save

WIFI_PS_MIN_MODEM
Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

WIFI_PS_MAX_MODEM
Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in wifi_sta_config_t

enum wifi_bandwidth_t
Values:

WIFI_BW_HT20 = 1

WIFI_BW_HT40

enum wifi_storage_t
Values:

WIFI_STORAGE_FLASH
all configuration will store in both memory and flash

WIFI_STORAGE_RAM
all configuration will only store in the memory

enum wifi_vendor_ie_type_t
Vendor Information Element type.
Determines the frame type that the IE will be associated with.

Values:

WIFI_VND_IE_TYPE_BEACON

WIFI_VND_IE_TYPE_PROBE_REQ

WIFI_VND_IE_TYPE_PROBE_RESP

WIFI_VND_IE_TYPE_ASSOC_REQ

WIFI_VND_IE_TYPE_ASSOC_RESP

2.2. Networking APIs
enum wifi_vendor_ie_id_t
    Vendor Information Element index.
    Each IE type can have up to two associated vendor ID elements.
    Values:
    WIFI_VND_IE_ID_0
    WIFI_VND_IE_ID_1

enum wifi_promiscuous_pkt_type_t
    Promiscuous frame type.
    Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.
    Values:
    WIFI_PKT_MGMT
        Management frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
    WIFI_PKT_CTRL
        Control frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
    WIFI_PKT_DATA
        Data frame, indiciates ‘buf’ argument is wifi_promiscuous_pkt_t
    WIFI_PKT_MISC
        Other type, such as MIMO etc. ‘buf’ argument is wifi_promiscuous_pkt_t but the payload is zero length.

enum wifi_ant_mode_t
    WiFi antenna mode.
    Values:
    WIFI_ANT_MODE_ANT0
        Enable WiFi antenna 0 only
    WIFI_ANT_MODE_ANT1
        Enable WiFi antenna 1 only
    WIFI_ANT_MODE_AUTO
        Enable WiFi antenna 0 and 1, automatically select an antenna
    WIFI_ANT_MODE_MAX
        Invalid WiFi enabled antenna

enum wifi_phy_rate_t
    WiFi PHY rate encodings.
    Values:
    WIFI_PHY_RATE_1M_L = 0x00
        1 Mbps with long preamble
    WIFI_PHY_RATE_2M_L = 0x01
        2 Mbps with long preamble

WIFI_PHY_RATE_MCS7_LGI = 0x17
   MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz
WIFI_PHY_RATE_MCS0_SGI = 0x18
   MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz
WIFI_PHY_RATE_MCS1_SGI = 0x19
   MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz
WIFI_PHY_RATE_MCS2_SGI = 0x1A
   MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz
WIFI_PHY_RATE_MCS3_SGI = 0x1B
MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz

WIFI_PHY_RATE_MCS4_SGI = 0x1C
MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

WIFI_PHY_RATE_MCS5_SGI = 0x1D
MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

WIFI_PHY_RATE_MCS6_SGI = 0x1E
MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

WIFI_PHY_RATE_MCS7_SGI = 0x1F
MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

WIFI_PHY_RATE_LORA_250K = 0x29
250 Kbps

WIFI_PHY_RATE_LORA_500K = 0x2A
500 Kbps

WIFI_PHY_RATE_MAX

enum wifi_event_t
WiFi event declarations

Values:

WIFI_EVENT_WIFI_READY = 0
ESP32 WiFi ready

WIFI_EVENT_SCAN_DONE
ESP32 finish scanning AP

WIFI_EVENT_STA_START
ESP32 station start

WIFI_EVENT_STA_STOP
ESP32 station stop

WIFI_EVENT_STA_CONNECTED
ESP32 station connected to AP

WIFI_EVENT_STA_DISCONNECTED
ESP32 station disconnected from AP

WIFI_EVENT_STA_AUTHMODE_CHANGE
the auth mode of AP connected by ESP32 station changed

WIFI_EVENT_STA_WPS_ER_SUCCESS
ESP32 station wps succeeds in enrollee mode

WIFI_EVENT_STA_WPS_ER_FAILED
ESP32 station wps fails in enrollee mode

WIFI_EVENT_STA_WPS_ER_TIMEOUT
ESP32 station wps timeout in enrollee mode

WIFI_EVENT_STA_WPS_ER_PIN
ESP32 station wps pin code in enrollee mode

WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP
ESP32 station wps overlap in enrollee mode
WIFI_EVENT_AP_START
   ESP32 soft-AP start

WIFI_EVENT_AP_STOP
   ESP32 soft-AP stop

WIFI_EVENT_AP_STACONNECTED
   a station connected to ESP32 soft-AP

WIFI_EVENT_AP_STADISCONNECTED
   a station disconnected from ESP32 soft-AP

WIFI_EVENT_AP_PROBEREQRECVED
   Receive probe request packet in soft-AP interface

WIFI_EVENT_MAX
   Invalid WiFi event ID

enum wifi_event_sta_wps_fail_reason_t
   Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event
   Values:
   WPS_FAIL_REASON_NORMAL = 0
      ESP32 WPS normal fail reason
   WPS_FAIL_REASON_RECV_M2D
      ESP32 WPS receive M2D frame
   WPS_FAIL_REASON_MAX

SmartConfig

[]

API Reference

Header File

   • esp_wifi/include/esp_smartconfig.h

Functions

const char *esp_smartconfig_get_version (void)
   Get the version of SmartConfig.

   Return
   • SmartConfig version const char.

esp_err_t esp_smartconfig_start (const smartconfig_start_config_t *config)
   Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device
   sniffer special packets from the air that containing SSID and password of target AP.

   Attention 1. This API can be called in station or softAP-station mode.
   Attention 2. Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

2.2. Networking APIs
Return

- ESP_OK: succeed
- others: fail

Parameters

- config: pointer to smartconfig start configure structure

```c
esp_err_t esp_smartconfig_stop(void)
```

Stop SmartConfig, free the buffer taken by esp_smartconfig_start.

Attention Whether connect to AP succeed or not, this API should be called to free memory taken by smartconfig_start.

Return

- ESP_OK: succeed
- others: fail

```c
esp_err_t esp_esptouch_set_timeout(uint8_t time_s)
```

Set timeout of SmartConfig process.

Attention Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

Return

- ESP_OK: succeed
- others: fail

Parameters

- time_s: range 15s~255s, offset:45s.

```c
esp_err_t esp_smartconfig_set_type(smartconfig_type_t type)
```

Set protocol type of SmartConfig.

Attention If users need to set the SmartConfig type, please set it before calling esp_smartconfig_start.

Return

- ESP_OK: succeed
- others: fail

Parameters

- type: Choose from the smartconfig_type_t.

```c
esp_err_t esp_smartconfig_fast_mode(bool enable)
```

Set mode of SmartConfig. default normal mode.

Attention 1. Please call it before API esp_smartconfig_start.

Attention 2. Fast mode have corresponding APP(phone).

Attention 3. Two mode is compatible.

Return

- ESP_OK: succeed
• others: fail

**Parameters**

• **enable**: false-disable(default); true-enable;

**Structures**

```c
struct smartconfig_event_got_ssid_pswd_t
```
Argument structure for SC_EVENT_GOT_SSID_PSWD event

**Public Members**

```c
uint8_t ssid[32]
```
SSID of the AP. Null terminated string.

```c
uint8_t password[64]
```
Password of the AP. Null terminated string.

```c
bool bssid_set
```
whether set MAC address of target AP or not.

```c
uint8_t bssid[6]
```
MAC address of target AP.

```c
smartconfig_type_t type
```
Type of smartconfig(ESPTouch or AirKiss).

```c
uint8_t token
```
Token from cellphone which is used to send ACK to cellphone.

```c
uint8_t cellphone_ip[4]
```
IP address of cellphone.

```c
struct smartconfig_start_config_t
```
Configure structure for esp_smartconfig_start

**Public Members**

```c
bool enable_log
```
Enable smartconfig logs.

**Macros**

```c
SMARTCONFIG_START_CONFIG_DEFAULT()
```

**Enumerations**

```c
enum smartconfig_type_t
```
Values:

```c
SC_TYPE_ESPTOUCH = 0
```
protocol: ESPTouch

---

2.2. Networking APIs
SC_TYPE_AIRKISS
protocol: AirKiss

SC_TYPE_ESPTOUCH_AIRKISS
protocol: ESPTouch and AirKiss

enum smartconfig_event_t
Smartconfig event declarations

Values:

SC_EVENT_SCAN_DONE
ESP32 station smartconfig has finished to scan for APs

SC_EVENT_FOUND_CHANNEL
ESP32 station smartconfig has found the channel of the target AP

SC_EVENT_GOT_SSID_PSWD
ESP32 station smartconfig got the SSID and password

SC_EVENT_SEND_ACK_DONE
ESP32 station smartconfig has sent ACK to cellphone

ESP-NOW

[]

Overview

ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol (CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

Frame Format

ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

<table>
<thead>
<tr>
<th>MAC Header</th>
<th>Category Code</th>
<th>Organization Identifier</th>
<th>Random Values</th>
<th>Vendor Specific Content</th>
<th>FCS</th>
</tr>
</thead>
<tbody>
<tr>
<td>24 bytes</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>4 bytes</td>
<td>7~</td>
<td></td>
</tr>
</tbody>
</table>

- Category Code: The Category Code field is set to the value (127) indicating the vendor-specific category.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Random Value: The Random Value field is used to prevent relay attacks.
- Vendor Specific Content: The Vendor Specific Content contains vendor-specific fields as follows:
<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Organization Identifier</th>
<th>Type</th>
<th>Version</th>
<th>Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>1 byte</td>
<td>1 byte</td>
<td>0~250 bytes</td>
</tr>
</tbody>
</table>

- **Element ID**: The Element ID field is set to the value (221), indicating the vendor-specific element.
- **Length**: The length is the total length of Organization Identifier, Type, Version and Body.
- **Organization Identifier**: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Type**: The Type field is set to the value (4) indicating ESP-NOW.
- **Version**: The Version field is set to the version of ESP-NOW.
- **Body**: The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

**Security**

ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame. The PMK is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.

- **PMK** is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.
- **LMK** of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

**Initialization and De-initialization**

Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When `esp_now_deinit()` is called, all of the information of paired devices will be deleted.

**Add Paired Device**

Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. The maximum number of paired devices is twenty. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data. A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.
Send ESP-NOW Data

Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn’t exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

Receiving ESP-NOW Data

Call `esp_now_register_recv_cb` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

API Reference

Header File

- esp_wifi/include/esp_now.h

Functions

```c
esp_err_t esp_now_init (void)
Initialize ESPNOW function.

Return
- ESP_OK : succeed
- ESP_ERR_ESPNOW_INTERNAL : Internal error
```

```c
esp_err_t esp_now_deinit (void)
De-initialize ESPNOW function.

Return
- ESP_OK : succeed
```

```c
esp_err_t esp_now_get_version (uint32_t *version)
Get the version of ESPNOW.

Return
- ESP_OK : succeed
```
• ESP_ERR_ESPNOW_ARG: invalid argument

**Parameters**

• version: ESPNOW version

```c
esp_err_t esp_now_register_recv_cb(esp_now_recv_cb_t cb)
```
Register callback function of receiving ESPNOW data.

**Return**

• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_INTERNAL: internal error

**Parameters**

• cb: callback function of receiving ESPNOW data

```c
esp_err_t esp_now_unregister_recv_cb(void)
```
Unregister callback function of receiving ESPNOW data.

**Return**

• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

```c
esp_err_t esp_now_register_send_cb(esp_now_send_cb_t cb)
```
Register callback function of sending ESPNOW data.

**Return**

• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_INTERNAL: internal error

**Parameters**

• cb: callback function of sending ESPNOW data

```c
esp_err_t esp_now_unregister_send_cb(void)
```
Unregister callback function of sending ESPNOW data.

**Return**

• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

```c
esp_err_t esp_now_send(const uint8_t *peer_addr, const uint8_t *data, size_t len)
```
Send ESPNOW data.

**Attention** 1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr
2. If peer_addr is NULL, send data to all of the peers that are added to the peer list
3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN

## 2.2. Networking APIs
Attention 4. The buffer pointed to by data argument does not need to be valid after esp_now_send returns

Return

• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_INTERNAL : internal error
• ESP_ERR_ESPNOW_NO_MEM : out of memory
• ESP_ERR_ESPNOW_NOT_FOUND : peer is not found
• ESP_ERR_ESPNOW_IF : current WiFi interface doesn’t match that of peer

Parameters

• peer_addr: peer MAC address
• data: data to send
• len: length of data

```
esp_err_t esp_now_add_peer(const esp_now_peer_info_t* peer)
```

Add a peer to peer list.

Return

• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_FULL : peer list is full
• ESP_ERR_ESPNOW_NO_MEM : out of memory
• ESP_ERR_ESPNOW_EXIST : peer has existed

Parameters

• peer: peer information

```
esp_err_t esp_now_del_peer(const uint8_t* peer_addr)
```

Delete a peer from peer list.

Return

• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

Parameters

• peer_addr: peer MAC address

```
esp_err_t esp_now_mod_peer(const esp_now_peer_info_t* peer)
```

Modify a peer.
Return

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_FULL : peer list is full

Parameters

- peer: peer information

```c
esp_err_t esp_now_get_peer(const uint8_t *peer_addr, esp_now_peer_info_t *peer)
```

Get a peer whose MAC address matches peer_addr from peer list.

Return

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

Parameters

- peer_addr: peer MAC address
- peer: peer information

```c
esp_err_t esp_now_fetch_peer(bool from_head, esp_now_peer_info_t *peer)
```

Fetch a peer from peer list.

Return

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

Parameters

- from_head: fetch from head of list or not
- peer: peer information

```c
bool esp_now_is_peer_exist(const uint8_t *peer_addr)
```

Peer exists or not.

Return

- true : peer exists
- false : peer not exists

Parameters

- peer_addr: peer MAC address
esp_err_t esp_now_get_peer_num(esp_now_peer_num_t *num)
Get the number of peers.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument

Parameters
• num: number of peers

esp_err_t esp_now_set_pmk(const uint8_t *pmk)
Set the primary master key.

Attention 1. primary master key is used to encrypt local master key

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument

Parameters
• pmk: primary master key

Structures

struct esp_now_peer_info
ESPNOW peer information parameters.

Public Members

uint8_t peer_addr[ESP_NOW_ETH_ALEN]
ESPNOW peer MAC address that is also the MAC address of station or softap

uint8_t lmk[ESP_NOW_KEY_LEN]
ESPNOW peer local master key that is used to encrypt data

uint8_t channel
Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel
which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

wifi_interface_t ifidx
Wi-Fi interface that peer uses to send/receive ESPNOW data

bool encrypt
ESPNOW data that this peer sends/receives is encrypted or not

void *priv
ESPNOW peer private data

struct esp_now_peer_num
Number of ESPNOW peers which exist currently.
Public Members

int total_num
   Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM

int encrypt_num
   Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM

Macros

ESP_ERR_ESPNOW_BASE
   ESPNOW error number base.

ESP_ERR_ESPNOW_NOT_INIT
   ESPNOW is not initialized.

ESP_ERR_ESPNOW_ARG
   Invalid argument

ESP_ERR_ESPNOW_NO_MEM
   Out of memory

ESP_ERR_ESPNOW_FULL
   ESPNOW peer list is full

ESP_ERR_ESPNOW_NOT_FOUND
   ESPNOW peer is not found

ESP_ERR_ESPNOW_INTERNAL
   Internal error

ESP_ERR_ESPNOW_EXIST
   ESPNOW peer has existed

ESP_ERR_ESPNOW_IF
   Interface error

ESP_NOW_ETH_ALEN
   Length of ESPNOW peer MAC address

ESP_NOW_KEY_LEN
   Length of ESPNOW peer local master key

ESP_NOW_MAX_TOTAL_PEER_NUM
   Maximum number of ESPNOW total peers

ESP_NOW_MAX_ENCRYPT_PEER_NUM
   Maximum number of ESPNOW encrypted peers

ESP_NOW_MAX_DATA_LEN
   Maximum length of ESPNOW data which is sent very time

Type Definitions

typedef struct esp_now_peer_info esp_now_peer_info_t
   ESPNOW peer information parameters.

typedef struct esp_now_peer_num esp_now_peer_num_t
   Number of ESPNOW peers which exist currently.
`typedef void (*esp_now_recv_cb_t)(const uint8_t *mac_addr, const uint8_t *data, int data_len)`

Callback function of receiving ESPNOW data.

**Parameters**

- `mac_addr`: peer MAC address
- `data`: received data
- `data_len`: length of received data

`typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)`

Callback function of sending ESPNOW data.

**Parameters**

- `mac_addr`: peer MAC address
- `status`: status of sending ESPNOW data (succeed or fail)

**Enumerations**

```c
enum esp_now_send_status_t
    Status of sending ESPNOW data .

Values:

    ESP_NOW_SEND_SUCCESS = 0
    Send ESPNOW data successfully

    ESP_NOW_SEND_FAIL
    Send ESPNOW data fail
```

**ESP-MESH Programming Guide**

This is a programming guide for ESP-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. *ESP-MESH Programming Model*
2. Writing an ESP-MESH Application
3. Self Organized Networking
4. Application Examples
5. API Reference

For documentation regarding the ESP-MESH protocol, please see the *ESP-MESH API Guide*. For more information about ESP-MESH Development Framework, please see ESP-MESH Development Framework.

**ESP-MESH Programming Model**

**Software Stack**

The ESP-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-MESH software stack.
Fig. 2: ESP-MESH Software Stack

**System Events**

An application interfaces with ESP-MESH via **ESP-MESH Events**. Since ESP-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the **Wi-Fi Event Task**. The following diagram illustrates the interfaces for the various System Events in an ESP-MESH application.

![ESP-MESH System Events Delivery Diagram](image)

Fig. 3: ESP-MESH System Events Delivery

The `mesh_event_id_t` defines all possible ESP-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-MESH events can be used, the application must register a **Mesh Events handler** via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-MESH event relevant to the application.

Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, `IP_EVENT_STA_GOT_IP` and `IP_EVENT_STA_LOST_IP` can be used to indicate when the root node can and cannot transmit data to the external IP network.

**Warning:** When using ESP-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-MESH’s self-organizing behavior. Therefore, user’s should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

---

2.2. Networking APIs
LwIP & ESP-MESH

The application can access the ESP-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

Each node is required to initialize LwIP by calling `tcpip_adapter_init()`. In order to prevent non-root node access to LwIP, the application should stop the following services after LwIP initialization:

- DHCP server service on the softAP interface.
- DHCP client service on the station interface.

The following code snippet demonstrates how to initialize LwIP for ESP-MESH applications.

```c
/* tcpip initialization */
tcpip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));
```

Note: ESP-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, the corresponding handler must start the DHCP client service and immediately obtain an IP address. Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

Writing an ESP-MESH Application

The prerequisites for starting ESP-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-MESH itself can be initialized.

```c
tcpip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));

/* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());

/* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_event_handler, NULL));
```
After initializing LwIP and Wi-Fi, the process of getting an ESP-MESH network up and running can be summarized into the following three steps:

1. **Initialize Mesh**
2. **Configuring an ESP-MESH Network**
3. **Start Mesh**

### Initialize Mesh

The following code snippet demonstrates how to initialize ESP-MESH

```c
/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_event_handler, NULL));
```

### Configuring an ESP-MESH Network

ESP-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-MESH:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Range from 1 to 14</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ID of ESP-MESH Network, see <code>mesh_addr_t</code></td>
</tr>
<tr>
<td>Router</td>
<td>Router Configuration, see <code>mesh_router_t</code></td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP Configuration, see <code>mesh_ap_cfg_t</code></td>
</tr>
<tr>
<td>Crypto Functions</td>
<td>Crypto Functions for Mesh IE, see <code>mesh_crypto_funcs_t</code></td>
</tr>
</tbody>
</table>

The following code snippet demonstrates how to configure ESP-MESH.

```c
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *)&cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router's channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *)&cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *)&cfg.router.password, CONFIG_MESH_ROUTER_PASSWD, strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *)&cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD, strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));
```
Start Mesh

The following code snippet demonstrates how to start ESP-MESH.

```c
// mesh start */
ESP_ERROR_CHECK(esp_mesh_start());
```

After starting ESP-MESH, the application should check for ESP-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-MESH network using `esp_mesh_send()` and `esp_mesh_recv()`.

Self Organized Networking

Self organized networking is a feature of ESP-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see Automatic Root Node Selection in Building a Network)
- Selection of a preferred parent node (see Parent Node Selection in Building a Network)
- Automatic reconnection upon detecting a disconnection (see Intermediate Parent Node Failure in Managing a Network)

When self organized networking is enabled, the ESP-MESH stack will internally make calls to Wi-Fi APIs. Therefore, the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-MESH.

Toggling Self Organized Networking

Self organized networking can be enabled or disabled by the application at runtime by calling the `esp_mesh_set_self_organized()` function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending the node type and the node’s current state. This parameter is unused when disabling self organized networking.

Disabling Self Organized Networking

The following code snippet demonstrates how to disable self organized networking.

```c
//Disable self organized networking
esp_mesh_set_self_organized(false, false);
```

ESP-MESH will attempt to maintain the node’s current Wi-Fi state when disabling self organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.
Enabling Self Organized Networking

ESP-MESH will attempt to maintain the node’s current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.

<table>
<thead>
<tr>
<th>Select Parent</th>
<th>Is Root Node</th>
<th>Effects</th>
</tr>
</thead>
</table>
| N             | N            | • Nodes already connected to a parent node will remain connected.  
               |               | • Nodes previously scanning for a parent nodes will stop scanning. Call `esp_mesh_connect()` to restart. |
| Y             | N            | • A root node already connected to router will stay connected.  
               |               | • A root node disconnected from router will need to call `esp_mesh_connect()` to reconnect. |
| Y             | N            | • Nodes without a parent node will automatically select a preferred parent and connect.  
               |               | • Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect. |
| Y             | Y            | • For a root node to connect to a parent node, it must give up its role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect. |

The following code snippet demonstrates how to enable self organized networking.

```c
//Enable self organized networking and select a new parent
esp_mesh_set_self_organized(true, true);
...

//Enable self organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```
Calling Wi-Fi API

There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-MESH. For example, an application may want to manually scan for neighboring APs. However, **self organized networking must be disabled before the application calls any Wi-Fi APIs**. This will prevent the ESP-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application’s calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using ESP-MESH.

```c
//Disable self organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();

//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results
...

//Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);

...

//Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);

...

//Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); //Don't select new parent
esp_mesh_connect(); //Manually reconnect to router
```

Application Examples

ESP-IDF contains these ESP-MESH example projects:

The Internal Communication Example demonstrates how to set up a ESP-MESH network and have the root node send a data packet to every node within the network.

The Manual Networking Example demonstrates how to use ESP-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

API Reference

Header File

- `esp_wifi/include/esp_mesh.h`
Functions

`esp_err_t esp_mesh_init(void)`
- Mesh initialization.
  - Check whether Wi-Fi is started.
  - Initialize mesh global variables with default values.

Attention This API shall be called after Wi-Fi is started.

Return
- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_deinit(void)`
- Mesh de-initialization.
  - Release resources and stop the mesh

Return
- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_start(void)`
- Start mesh.
  - Initialize mesh IE.
  - Start mesh network management service.
  - Create TX and RX queues according to the configuration.
  - Register mesh packets receive callback.

Attention This API shall be called after mesh initialization and configuration.

Return
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

`esp_err_t esp_mesh_stop(void)`
- Stop mesh.
  - Deinitialize mesh IE.
  - Disconnect with current parent.
  - Disassociate all currently associated children.
  - Stop mesh network management service.
• Unregister mesh packets receive callback.
• Delete TX and RX queues.
• Release resources.
• Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.

Return
• ESP_OK
• ESP_FAIL

\[ \text{esp_err_t \ esp_mesh_send(}\text{const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[], int opt_count)}\]

Send a packet over the mesh network.

• Send a packet to any device in the mesh network.
• Send a packet to external IP network.

Attention This API is not reentrant.

Return
• ESP_OK
• ESP_FAIL
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_DISCONNECTED
• ESP_ERR_MESH_OPT_UNKNOWN
• ESP_ERR_MESH_EXCEED_MTU
• ESP_ERR_MESH_NO_MEMORY
• ESP_ERR_MESH_TIMEOUT
• ESP_ERR_MESH_QUEUE_FULL
• ESP_ERR_MESH_NO_ROUTE_FOUND
• ESP_ERR_MESH_DISCARD

Parameters
• \text{to:} the address of the final destination of the packet
  – If the packet is to the root, set this parameter to NULL.
  – If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
• \text{data:} pointer to a sending mesh packet
  – Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
  – Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).

- **flag**: bitmap for data sent
  - Speed up the route search
    * If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    * If the packet is to an internal device, MESH_DATA_P2P should be set.
    * If the packet is to the root (“to” parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
    * If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    * If needs non-block, MESH_DATA_NONBLOCK should be set.
  - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by esp_mesh_recv_toDS().

    Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_recv_toDS() which avoids unnecessary memory copy.

- **opt**: options
  - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.

- **opt_count**: option count
  - Currently, this API only takes one option, so opt_count is only supported to be 1.

```c
esp_err_t esp_mesh_recv(mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)
```

Receive a packet targeted to self over the mesh network.

flag could be MESH_DATA_FROMDS or MESH_DATA_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.

- Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD

**Parameters**
- **from**: the address of the original source of the packet
- **data**: pointer to the received mesh packet
  - Field *proto* is the data protocol in use. Should follow it to parse the received data.
  - Field *tos* is the transmission *tos* (type of service) in use.
- **timeout_ms**: wait time if a packet isn’t immediately available (0:no wait, portMAX_DELAY:wait forever)
- **flag**: bitmap for data received
  - MESH_DATA_FROMDS represents data from external IP network
  - MESH_DATA_TODS represents data directed upward within the mesh network

**Parameters**

- **opt**: options desired to receive
  - MESH_OPT_RECV_DS_ADDR attaches the DS address
- **opt_count**: option count desired to receive
  - Currently, this API only takes one option, so *opt_count* is only supported to be 1.

```c
esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)
```

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this esp_mesh_recv_toDS() hasn’t been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using esp_mesh_set_xon_qsize() users may configure the RX queue size, default:32. If this size is too large, and esp_mesh_recv_toDS() isn’t called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH_DATA_TODS.

**Attention** This API is only called by the root.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD

**Parameters**

- **from**: the address of the original source of the packet
- **to**: the address contains remote IP address and port (IPv4:PORT)
• data: pointer to the received packet
  – Contain the protocol and applications should follow it to parse the data.
• timeout_ms: wait time if a packet isn’t immediately available (0:no wait, portMAX_DELAY:wait forever)
• flag: bitmap for data received
  – MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.

Parameters
  • opt: options desired to receive
  • opt_count: option count desired to receive

```c
esp_err_t esp_mesh_set_config(const mesh_cfg_t *config)
```
Set mesh stack configuration.

- Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

Return
  • ESP_OK
  • ESP_ERR_MESH_ARGUMENT
  • ESP_ERR_MESH_NOT_ALLOWED

Parameters
  • config: pointer to mesh stack configuration

```c
esp_err_t esp_mesh_get_config(mesh_cfg_t *config)
```
Get mesh stack configuration.

Return
  • ESP_OK
  • ESP_ERR_MESH_ARGUMENT
Parameters

- `config`: pointer to mesh stack configuration

`esp_err_t esp_mesh_set_router(const mesh_router_t *router)`
Get router configuration.

Attention This API is used to dynamically modify the router configuration after mesh is configured.

Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

Parameters

- `router`: pointer to router configuration

`esp_err_t esp_mesh_get_router(mesh_router_t *router)`
Get router configuration.

Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

Parameters

- `router`: pointer to router configuration

`esp_err_t esp_mesh_set_id(const mesh_addr_t *id)`
Set mesh network ID.

Attention This API is used to dynamically modify the mesh network ID.

Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

Parameters

- `id`: pointer to mesh network ID

`esp_err_t esp_mesh_get_id(mesh_addr_t *id)`
Get mesh network ID.

Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

Parameters

- `id`: pointer to mesh network ID

`esp_err_t esp_mesh_set_type(mesh_type_t type)`
Designate device type over the mesh network.
• MESH_ROOT: designates the root node for a mesh network
• MESH_LEAF: designates a device as a standalone Wi-Fi station

Return
• ESP_OK
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• type: device type

mesh_type_t esp_mesh_get_type (void)
Get device type over mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Return mesh type

esp_err_t esp_mesh_set_max_layer (int max_layer)
Set network max layer value (max:25, default:25)

• Network max layer limits the max hop count.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• max_layer: max layer value

int esp_mesh_get_max_layer (void)
Get max layer value.

Return max layer value

esp_err_t esp_mesh_set_ap_password (const uint8_t *pwd, int len)
Set mesh softAP password.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• pwd: pointer to the password
• len: password length
```
esp_err_t esp_mesh_set_ap_authmode(wifi_auth_mode_t authmode)
Set mesh softAP authentication mode.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• authmode: authentication mode

wifi_auth_mode_t esp_mesh_get_ap_authmode(void)
Get mesh softAP authentication mode.

Return authentication mode

esp_err_t esp_mesh_set_ap_connections(int connections)
Set mesh softAP max connection value.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

Parameters
• connections: the number of max connections

int esp_mesh_get_ap_connections(void)
Get mesh softAP max connection configuration.

Return the number of max connections

int esp_mesh_get_layer(void)
Get current layer value over the mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Return layer value

esp_err_t esp_mesh_get_parent_bssid(mesh_addr_t *bssid)
Get the parent BSSID.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Return
• ESP_OK
• ESP_FAIL

Parameters
```
• **bssid**: pointer to parent BSSID

```c
bool esp_mesh_is_root (void)
```

Return whether the device is the root node of the network.

**Return**  true/false

```c
esp_err_t esp_mesh_set_self_organized (bool enable, bool select_parent)
```

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via esp_mesh_set_parent().

**Attention**  This API is used to dynamically modify whether to enable the self organizing.

**Return**  

- ESP_OK
- ESP_FAIL

**Parameters**  

- **enable**: enable or disable self-organized networking
- **select_parent**: Only valid when self-organized networking is enabled.
  - if select_parent is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

```c
bool esp_mesh_get_self_organized (void)
```

Return whether enable self-organized networking or not.

**Return**  true/false

```c
esp_err_t esp_mesh_waive_root (const mesh_vote_t *vote, int reason)
```

Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

**Attention**  This API is only called by the root.
Return

- ESP_OK
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_DISCARD
- ESP_FAIL

Parameters

- vote: vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field is_rc_specified shall be false.
  - Field attempts shall be at least 15 times.
- reason: only accept MESH_VOTE_REASON_ROOT_INITIATED for now

`esp_err_t esp_mesh_set_vote_percentage(float percentage)`
Set vote percentage threshold for approval of being a root.

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_FAIL

Parameters

- percentage: vote percentage threshold

`float esp_mesh_get_vote_percentage(void)`
Get vote percentage threshold for approval of being a root.

Return percentage threshold

`esp_err_t esp_mesh_set_ap_assoc_expire(int seconds)`
Set mesh softAP associate expired time (default: 10 seconds)

- If mesh softAP hasn’t received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

Return

- ESP_OK
- ESP_FAIL

Parameters

- seconds: the expired time
int esp_mesh_get_ap_assoc_expire (void)
   Get mesh softAP associate expired time.

   Return   seconds

int esp_mesh_get_total_node_num (void)
   Get total number of devices in current network (including the root)

   Attention   The returned value might be incorrect when the network is changing.
   Return   total number of devices (including the root)

int esp_mesh_get_routing_table_size (void)
   Get the number of devices in this device’s sub-network (including self)

   Return   the number of devices over this device’s sub-network (including self)

esp_err_t esp_mesh_get_routing_table (mesh_addr_t *mac, int len, int *size)
   Get routing table of this device’s sub-network (including itself)

   Return
      • ESP_OK
      • ESP_ERR_MESH_ARGUMENT

Parameters
   • mac: pointer to routing table
   • len: routing table size(in bytes)
   • size: pointer to the number of devices in routing table (including itself)

esp_err_t esp_mesh_post_toDS_state (bool reachable)
   Post the toDS state to the mesh stack.

   Attention   This API is only for the root.
   Return
      • ESP_OK
      • ESP_FAIL

Parameters
   • reachable: this state represents whether the root is able to access external IP network

esp_err_t esp_mesh_get_tx_pending (mesh_tx_pending_t *pending)
   Return the number of packets pending in the queue waiting to be sent by the mesh stack.

   Return
      • ESP_OK
      • ESP_FAIL

Parameters
   • pending: pointer to the TX pending
esp_err_t esp_mesh_get_rx_pending (mesh_rx_pending_t *pending)
Return the number of packets available in the queue waiting to be received by applications.

Return
• ESP_OK
• ESP_FAIL

Parameters
• pending: pointer to the RX pending

int esp_mesh_available_txupQ_num (const mesh_addr_t *addr, uint32_t *xseqno_in)
Return the number of packets could be accepted from the specified address.

Return the number of upQ for a certain address

Parameters
• addr: self address or an associate children address
• xseqno_in: sequence number of the last received packet from the specified address

esp_err_t esp_mesh_set_xon_qsize (int qsize)
Set the number of queue.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_FAIL

Parameters
• qsize: default:32 (min:16)

int esp_mesh_get_xon_qsize (void)
Get queue size.

Return the number of queue

esp_err_t esp_mesh_allow_root_conflicts (bool allowed)
Set whether allow more than one root existing in one network.

Return
• ESP_OK
• ESP_WIFI_ERR_NOT_INIT
• ESP_WIFI_ERR_NOT_START

Parameters
• allowed: allow or not

bool esp_mesh_is_root_conflicts_allowed (void)
Check whether allow more than one root to exist in one network.
esp_err_t esp_mesh_set_group_id(const mesh_addr_t *addr, int num)
Set group ID addresses.

Return
• ESP_OK
• ESP_MESH_ERR_ARGUMENT

Parameters
• addr: pointer to new group ID addresses
• num: the number of group ID addresses

esp_err_t esp_mesh_delete_group_id(const mesh_addr_t *addr, int num)
Delete group ID addresses.

Return
• ESP_OK
• ESP_MESH_ERR_ARGUMENT

Parameters
• addr: pointer to deleted group ID address
• num: the number of group ID addresses

int esp_mesh_get_group_num(void)
Get the number of group ID addresses.

Return
the number of group ID addresses

esp_err_t esp_mesh_get_group_list(mesh_addr_t *addr, int num)
Get group ID addresses.

Return
• ESP_OK
• ESP_MESH_ERR_ARGUMENT

Parameters
• addr: pointer to group ID addresses
• num: the number of group ID addresses

bool esp_mesh_is_my_group(const mesh_addr_t *addr)
Check whether the specified group address is my group.

Return true/false

esp_err_t esp_mesh_set_capacity_num(int num)
Set mesh network capacity (max:1000, default:300)

Attention This API shall be called before mesh is started.
Return

\[\begin{align*}
\text{• ESP_OK} \\
\text{• ESP_ERR_MESH_NOT_ALLOWED} \\
\text{• ESP_MESH_ERR_ARGUMENT}
\end{align*}\]

Parameters

\[\begin{align*}
\text{• num: mesh network capacity}
\end{align*}\]

int \text{esp_mesh_get_capacity_num}(\text{void})

Get mesh network capacity.

Return  mesh network capacity

\text{esp_err_t \text{esp_mesh_set_ie_crypto_funcs}(const mesh_crypto_funcs_t *crypto_funcs)}

Set mesh IE crypto functions.

\textbf{Attention}  This API can be called at any time after mesh is initialized.

Return

\[\begin{align*}
\text{• ESP_OK}
\end{align*}\]

Parameters

\[\begin{align*}
\text{• crypto_funcs: crypto functions for mesh IE} \\
\text{  – If crypto_funcs is set to NULL, mesh IE is no longer encrypted.}
\end{align*}\]

\text{esp_err_t \text{esp_mesh_set_ie_crypto_key}(const char *key, int len)}

Set mesh IE crypto key.

\textbf{Attention}  This API can be called at any time after mesh is initialized.

Return

\[\begin{align*}
\text{• ESP_OK} \\
\text{• ESP_MESH_ERR_ARGUMENT}
\end{align*}\]

Parameters

\[\begin{align*}
\text{• key: ASCII crypto key} \\
\text{• len: length in bytes, range: 8–64}
\end{align*}\]

\text{esp_err_t \text{esp_mesh_get_ie_crypto_key}(char *key, int len)}

Get mesh IE crypto key.

Return

\[\begin{align*}
\text{• ESP_OK} \\
\text{• ESP_MESH_ERR_ARGUMENT}
\end{align*}\]

Parameters

\[\begin{align*}
\text{• key: ASCII crypto key} \\
\text{• len: length in bytes, range: 8–64}
\end{align*}\]
esp_err_t esp_mesh_set_root_healing_delay (int delay_ms)
Set delay time before starting root healing.

Return
• ESP_OK

Parameters
• delay_ms: delay time in milliseconds

int esp_mesh_get_root_healing_delay (void)
Get delay time before network starts root healing.

Return delay time in milliseconds

esp_err_t esp_mesh_fix_root (bool enable)
Enable network Fixed Root Setting.

• Enabling fixed root disables automatic election of the root node via voting.
• All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
• If Fixed Root is enabled, users should make sure a root node is designated for the network.

Return
• ESP_OK

Parameters
• enable: enable or not

bool esp_mesh_is_root_fixed (void)
Check whether network Fixed Root Setting is enabled.

• Enable/disable network Fixed Root Setting by API esp_mesh_fix_root().
• Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

Return true/false

esp_err_t esp_mesh_set_parent (const wifi_config_t *parent, const mesh_addr_t *parent_mesh_id, mesh_type_t my_type, int my_layer)
Set a specified parent for the device.

Attention This API can be called at any time after mesh is configured.

Return
• ESP_OK
• ESP_ERR_ARGUMENT
• ESP_ERR_MESH_NOT_CONFIG

Parameters
• parent: parent configuration, the SSID and the channel of the parent are mandatory.
  – If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
• **parent_mesh_id**: parent mesh ID,
  – If this value is not set, the original mesh ID is used.

• **my_type**: mesh type
  – If the parent set for the device is the same as the router in the network configuration, then my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.

• **my_layer**: mesh layer
  – my_layer of the device may change after joining the network.
  – If my_type is set MESH_NODE, my_layer shall be greater than MESH_ROOT_LAYER.
  – If my_type is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

`esp_err_t esp_mesh_scan_get_ap_ie_len(int *len)`
Get mesh networking IE length of one AP.

**Return**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

**Parameters**
- `len`: mesh networking IE length

`esp_err_t esp_mesh_scan_get_ap_record(wifi_ap_record_t *ap_record, void *buffer)`
Get AP record.

**Attention** Different from esp_wifi_scan_get_ap_records(), this API only gets one of APs scanned each time. See “manual_networking” example.

**Return**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

**Parameters**
- `ap_record`: pointer to one AP record
- `buffer`: pointer to the mesh networking IE of this AP

`esp_err_t esp_mesh_flush_upstream_packets(void)`
Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

**Return**
- ESP_OK
**esp_err_t esp_mesh_get_subnet_nodes_num(const mesh_addr_t *child_mac, int *nodes_num)**

Get the number of nodes in the subnet of a specific child.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- child_mac: an associated child address of this device
- nodes_num: pointer to the number of nodes in the subnet of a specific child

**esp_err_t esp_mesh_get_subnet_nodes_list(const mesh_addr_t *child_mac, mesh_addr_t *nodes, int nodes_num)**

Get nodes in the subnet of a specific child.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- child_mac: an associated child address of this device
- nodes: pointer to nodes in the subnet of a specific child
- nodes_num: the number of nodes in the subnet of a specific child

**esp_err_t esp_mesh_disconnect(void)**

Disconnect from current parent.

**Return**
- ESP_OK

**esp_err_t esp_mesh_connect(void)**

Connect to current parent.

**Return**
- ESP_OK

**esp_err_t esp_mesh_flush_scan_result(void)**

Flush scan result.

**Return**
- ESP_OK

**esp_err_t esp_mesh_switch_channel(const uint8_t *new_bssid, int csa_newchan, int csa_count)**

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
• Set how many beacons with CSA IE will be sent before changing a new channel
• Enable the channel switch function

Attention This API is only called by the root.

Return
• ESP_OK

Parameters
• new_bssid: the new router BSSID if the router changes
• csa_newchan: the new channel number to which the whole network is moving
• csa_count: channel switch period(beacon count), unit is based on beacon interval of its softAP, the default value is 15.

```c
esp_err_t esp_mesh_get_router_bssid(uint8_t *router_bssid)
```
Get the router BSSID.

Return
• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_WIFI_ARG

Parameters
• router_bssid: pointer to the router BSSID

```c
int64_t esp_mesh_get_tsf_time(void)
```
Get the TSF time.

Return the TSF time

Unions

```c
union mesh_addr_t
#pragmainclude <esp_mesh.h> Mesh address.
```

Public Members

```c
uint8_t addr[6]
```
mac address

```c
mip_t mip
```
mip address

```c
union mesh_event_info_t
#pragmainclude <esp_mesh.h> Mesh event information.
```
Public Members

mesh_event_channel_switch_t channel_switch
channel switch

mesh_event_child_connected_t child_connected
child connected

mesh_event_child_disconnected_t child_disconnected
child disconnected

mesh_event_routing_table_change_t routing_table
routing table change

mesh_event_connected_t connected
parent connected

mesh_event_disconnected_t disconnected
parent disconnected

mesh_event_no_parent_found_t no_parent
no parent found

mesh_event_layer_change_t layer_change
layer change

mesh_event_toDS_state_t toDS_state
toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

mesh_event_vote_started_t vote_started
vote started

mesh_event_root_address_t root_addr
root address

mesh_event_root_switch_req_t switch_req
root switch request

mesh_event_root_conflict_t root_conflict
other powerful root

mesh_event_root_fixed_t root_fixed
fixed root

mesh_event_scan_done_t scan_done
scan done

mesh_event_network_state_t network_state
network state, such as whether current mesh network has a root.

mesh_event_find_network_t find_network
network found that can join

mesh_event_router_switch_t router_switch
new router information

union mesh_rc_config_t
#include <esp_mesh.h> Vote address configuration.
**Public Members**

int **attempts**
max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

**mesh_addr_t** **rc_addr**
a new root address specified by users for API esp_mesh_waive_root()

**Structures**

**struct mip_t**
IP address and port.

**Public Members**

**ip4_addr_t** **ip4**
IP address

**uint16_t** **port**
port

**struct mesh_event_channel_switch_t**
Channel switch information.

**Public Members**

**uint8_t** **channel**
new channel

**struct mesh_event_connected_t**
Parent connected information.

**Public Members**

**wifi_event_sta_connected_t** **connected**
parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

**uint8_t** **self_layer**
layer

**struct mesh_event_no_parent_found_t**
No parent found information.

**Public Members**

int **scan_times**
scan times being through

**struct mesh_event_layer_change_t**
Layer change information.
Public Members

```c
uint8_t new_layer
new layer
```

**struct mesh_event_vote_started_t**
vote started information

Public Members

```c
int reason
vote reason, vote could be initiated by children or by the root itself
```

```c
int attempts
max vote attempts before stopped
```

```c
mesh_addr_t rc_addr
root address specified by users via API esp_mesh_waive_root()
```

**struct mesh_event_find_network_t**
find a mesh network that this device can join

Public Members

```c
uint8_t channel
channel number of the new found network
```

```c
uint8_t router_bssid[6]
router BSSID
```

Public Members

```c
int reason
root switch reason, generally root switch is initialized by users via API esp_mesh_waive_root()
```

```c
mesh_addr_t rc_addr
the address of root switch requester
```

**struct mesh_event_root_conflict_t**
Other powerful root address.

Public Members

```c
int8_t rssi
rssi with router
```

```c
uint16_t capacity
the number of devices in current network
```

```c
uint8_t addr[6]
other powerful root address
```

**struct mesh_event_routing_table_change_t**
Routing table change.

2.2. Networking APIs
Public Members

\begin{verbatim}
uint16_t rt_size_new
  the new value

uint16_t rt_size_change
  the changed value
\end{verbatim}

\begin{verbatim}
struct mesh_event_root_fixed_t
  Root fixed.
\end{verbatim}

Public Members

\begin{verbatim}
bool is_fixed
  status
\end{verbatim}

\begin{verbatim}
struct mesh_event_scan_done_t
  Scan done event information.
\end{verbatim}

Public Members

\begin{verbatim}
uint8_t number
  the number of APs scanned
\end{verbatim}

\begin{verbatim}
struct mesh_event_network_state_t
  Network state information.
\end{verbatim}

Public Members

\begin{verbatim}
bool is_rootless
  whether current mesh network has a root
\end{verbatim}

\begin{verbatim}
struct mesh_opt_t
  Mesh option.
\end{verbatim}

Public Members

\begin{verbatim}
uint8_t type
  option type

uint16_t len
  option length

uint8_t *val
  option value
\end{verbatim}

\begin{verbatim}
struct mesh_data_t
  Mesh data for esp_mesh_send() and esp_mesh_recv()
\end{verbatim}

Public Members

\begin{verbatim}
uint8_t *data
  data
\end{verbatim}
### uint16_t size
- data size

### mesh_proto_t proto
- data protocol

### mesh_tos_t tos
- data type of service

#### struct mesh_router_t
- Router configuration.

##### Public Members

- **uint8_t ssid[32]**
  - SSID

- **uint8_t ssid_len**
  - length of SSID

- **uint8_t bssid[6]**
  - BSSID, if this value is specified, users should also specify “allow_router_switch”.

- **uint8_t password[64]**
  - password

- **bool allow_router_switch**
  - if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

#### struct mesh_ap_cfg_t
- Mesh softAP configuration.

##### Public Members

- **uint8_t password[64]**
  - mesh softAP password

- **uint8_t max_connection**
  - max number of stations allowed to connect in, max 10

#### struct mesh_cfg_t
- Mesh initialization configuration.

##### Public Members

- **uint8_t channel**
  - channel, the mesh network on

- **bool allow_channel_switch**
  - if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

### mesh_addr_t mesh_id
- mesh network identification
mesh_router_t router
    router configuration

mesh_ap_cfg_t mesh_ap
    mesh softAP configuration

const mesh_crypto_funcs_t *crypto_funcs
    crypto functions

struct mesh_vote_t
    Vote.

Public Members

float percentage
    vote percentage threshold for approval of being a root

bool is_rc_specified
    if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make
    network start root election.

mesh_rc_config_t config
    vote address configuration

struct mesh_tx_pending_t
    The number of packets pending in the queue waiting to be sent by the mesh stack.

Public Members

int to_parent
    to parent queue

int to_parent_p2p
    to parent (P2P) queue

int to_child
    to child queue

int to_child_p2p
    to child (P2P) queue

int mgmt
    management queue

int broadcast
    broadcast and multicast queue

struct mesh_rx_pending_t
    The number of packets available in the queue waiting to be received by applications.

Public Members

int toDS
    to external DS

int toSelf
    to self
Macros

MESH_ROOT_LAYER
root layer value

MESH_MTU
max transmit unit(in bytes)

MESH_MPS
max payload size(in bytes)

ESP_ERR_MESH_WIFI_NOT_START
Mesh error code definition.
Wi-Fi isn’t started

ESP_ERR_MESH_NOT_INIT
mesh isn’t initialized

ESP_ERR_MESH_NOT_CONFIG
mesh isn’t configured

ESP_ERR_MESH_NOT_START
mesh isn’t started

ESP_ERR_MESH_NOT_SUPPORT
not supported yet

ESP_ERR_MESH_NOT_ALLOWED
operation is not allowed

ESP_ERR_MESH_NO_MEMORY
out of memory

ESP_ERR_MESH_ARGUMENT
illegal argument

ESP_ERR_MESH_EXCEED_MTU
packet size exceeds MTU

ESP_ERR_MESH_TIMEOUT
timeout

ESP_ERR_MESH_DISCONNECTED
disconnected with parent on station interface

ESP_ERR_MESH_QUEUE_FAIL
queue fail

ESP_ERR_MESH_QUEUE_FULL
queue full

ESP_ERR_MESH_NO_PARENT_FOUND
no parent found to join the mesh network

ESP_ERR_MESH_NO_ROUTE_FOUND
no route found to forward the packet

ESP_ERR_MESH_OPTION_NULL
no option found

ESP_ERR_MESH_OPTION_UNKNOWN
unknown option
ESP_ERR_MESH_XON_NO_WINDOW
    no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE
    low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE
    discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD
    discard the packet

ESP_ERR_MESH_VOTING
    vote in progress

MESH_DATA_ENC
    Flags bitmap for esp_mesh_send() and esp_mesh_recv()
    data encrypted (Unimplemented)

MESH_DATA_P2P
    point-to-point delivery over the mesh network

MESH_DATA_FROMDS
    receive from external IP network

MESH_DATA_TODS
    identify this packet is target to external IP network

MESH_DATA_NONBLOCK
    esp_mesh_send() non-block

MESH_DATA_DROP
    in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP
    identify this packet is target to a group address

MESH_OPT_SEND_GROUP
    Option definitions for esp_mesh_send() and esp_mesh_recv()
    data transmission by group; used with esp_mesh_send() and shall have payload

MESH_OPT_RECV_DS_ADDR
    return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS
    Flag of mesh networking IE.
    vote in progress

MESH_ASSOC_FLAG_NETWORK_FREE
    no root in current network

MESH_ASSOC_FLAG_ROOTS_FOUND
    root conflict is found

MESH_ASSOC_FLAG_ROOT_FIXED
    fixed root

MESH_INIT_CONFIG_DEFAULT ()
Type Definitions

typedef mesh_addr_t mesh_event_root_address_t
   Root address.

typedef wifi_event_sta_disconnected_t mesh_event_disconnected_t
   Parent disconnected information.

typedef wifi_event_ap_stacconnected_t mesh_event_child_connected_t
   Child connected information.

typedef wifi_event_ap_stadisconnected_t mesh_event_child_disconnected_t
   Child disconnected information.

typedef wifi_event_sta_connected_t mesh_event_router_switch_t
   New router information.

Enumerations

enum mesh_event_id_t
   Enumerated list of mesh event id.

   Values:

   MESH_EVENT_STARTED
      mesh is started

   MESH_EVENT_STOPPED
      mesh is stopped

   MESH_EVENT_CHANNEL_SWITCH
      channel switch

   MESH_EVENT_CHILD_CONNECTED
      a child is connected on softAP interface

   MESH_EVENT_CHILD_DISCONNECTED
      a child is disconnected on softAP interface

   MESH_EVENT_ROUTING_TABLE_ADD
      routing table is changed by adding newly joined children

   MESH_EVENT_ROUTING_TABLE_REMOVE
      routing table is changed by removing leave children

   MESH_EVENT_PARENT_CONNECTED
      parent is connected on station interface

   MESH_EVENT_PARENT_DISCONNECTED
      parent is disconnected on station interface

   MESH_EVENT_NO_PARENT_FOUND
      no parent found

   MESH_EVENT_LAYER_CHANGE
      layer changes over the mesh network

   MESH_EVENT_TODS_STATE
      state represents whether the root is able to access external IP network

   MESH_EVENT_VOTE_STARTED
      the process of voting a new root is started either by children or by the root
MESH_EVENT_VOTE_STOPPED
the process of voting a new root is stopped

MESH_EVENT_ROOT_ADDRESS
the root address is obtained. It is posted by mesh stack automatically.

MESH_EVENT_ROOT_SWITCH_REQ
root switch request sent from a new voted root candidate

MESH_EVENT_ROOT_SWITCH_ACK
root switch acknowledgment responds the above request sent from current root

MESH_EVENT_ROOT_ASKED_YIELD
the root is asked yield by a more powerful existing root. If self organized is disabled and this device is
specified to be a root by users, users should set a new parent for this device. if self organized is enabled,
this device will find a new parent by itself, users could ignore this event.

MESH_EVENT_ROOT_FIXED
when devices join a network, if the setting of Fixed Root for one device is different from that of its parent,
the device will update the setting the same as its parent’s. Fixed Root Setting of each device is variable as
that setting changes of the root.

MESH_EVENT_SCAN_DONE
if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add
the corresponding scan done handler in this event.

MESH_EVENT_NETWORK_STATE
network state, such as whether current mesh network has a root.

MESH_EVENT_STOP_RECONNECTION
the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

MESH_EVENT_FIND_NETWORK
when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to
find a mesh network that can join, and return the channel value after finding it.

MESH_EVENT_ROUTER_SWITCH
if users specify BSSID of the router in mesh configuration, when the root connects to another router with
the same SSID, this event will be posted and the new router information is attached.

MESH_EVENT_MAX

enum mesh_type_t
Device type.

Values:

MESH_IDLE
hasn’t joined the mesh network yet

MESH_ROOT
the only sink of the mesh network. Has the ability to access external IP network

MESH_NODE
intermediate device. Has the ability to forward packets over the mesh network

MESH_LEAF
has no forwarding ability

enum mesh_proto_t
Protocol of transmitted application data.

Values:
MESH_PROTO_BIN
  binary
MESH_PROTO_HTTP
  HTTP protocol
MESH_PROTO_JSON
  JSON format
MESH_PROTO_MQTT
  MQTT protocol

enum mesh_tos_t
  For reliable transmission, mesh stack provides three type of services.
  Values:
    MESH_TOS_P2P
      provide P2P (point-to-point) retransmission on mesh stack by default
    MESH_TOS_E2E
      provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)
    MESH_TOS_DEF
      no retransmission on mesh stack

enum mesh_vote_reason_t
  Vote reason.
  Values:
    MESH_VOTE_REASON_ROOT_INITIATED = 1
      vote is initiated by the root
    MESH_VOTE_REASON_CHILD_INITIATED
      vote is initiated by children

enum mesh_disconnect_reason_t
  Mesh disconnect reason code.
  Values:
    MESH_REASON_CYCLIC = 100
      cyclic is detected
    MESH_REASON_PARENT_IDLE
      parent is idle
    MESH_REASON_LEAF
      the connected device is changed to a leaf
    MESH_REASON_DIFF_ID
      in different mesh ID
    MESH_REASON_ROOTS
      root conflict is detected
    MESH_REASON_PARENT_STOPPED
      parent has stopped the mesh
    MESH_REASON_SCAN_FAIL
      scan fail
    MESH_REASON_IE_UNKNOWN
      unknown IE
**MESH_REASON_WAIVE_ROOT**

waive root

**MESH_REASON_PARENT_WORSE**

parent with very poor RSSI

**MESH_REASON_EMPTY_PASSWORD**

use an empty password to connect to an encrypted parent

**MESH_REASON_PARENT_UNENCRYPTED**

connect to an unencrypted parent/router

**enum mesh_event_toDS_state_t**

The reachability of the root to a DS (distribute system)

**Values:**

**MESH_TODS_UNREACHABLE**

the root isn’t able to access external IP network

**MESH_TODS_REACHABLE**

the root is able to access external IP network

Code examples for the Wi-Fi API are provided in the `wifi` directory of ESP-IDF examples. Code examples for ESP-MESH are provided in the `mesh` directory of ESP-IDF examples.

### 2.2.2 Ethernet

**Ethernet**

[]

**Application Example**

- Ethernet basic example: `ethernet/ethernet`
- Ethernet iperf example: `ethernet/iperf`

**Ethernet Driver Model**

- `esp_eth/include/esp_eth.h`

**Ethernet Common Interface**

- `esp_eth/include/esp_eth_com.h`

**Ethernet MAC Interface**

- `esp_eth/include/esp_eth_mac.h`
Ethernet PHY Interface

- esp_eth/include/esp_eth_phy.h

Ethernet PHY Common Registers

- esp_eth/include/eth_phy_regs_struct.h

API Reference - Driver Model

Header File

- esp_eth/include/esp_eth.h

Functions

```c
esp_err_t esp_eth_driver_install(const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)
```
Install Ethernet driver.

**Return**
- ESP_OK: install esp_eth driver successfully
- ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install esp_eth driver failed because there’s no memory for driver
- ESP_FAIL: install esp_eth driver failed because some other error occurred

**Parameters**
- `config`: configuration of the Ethernet driver
- `out_hdl`: handle of Ethernet driver

```c
esp_err_t esp_eth_driver_uninstall(esp_eth_handle_t hdl)
```
Uninstall Ethernet driver.

**Note** It’s not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

**Return**
- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

**Parameters**
- `hdl`: handle of Ethernet driver
**esp_err_t esp_eth_start (esp_eth_handle_t hdl)**

Start Ethernet driver ONLY in standalone mode (i.e. without TCP/IP stack)

**Note** This API will start driver state machine and internal software timer (for checking link status).

**Return**

- ESP_OK: start esp_eth driver successfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

**Parameters**

- hdl: handle of Ethernet driver

**esp_err_t esp_eth_stop (esp_eth_handle_t hdl)**

Stop Ethernet driver.

**Note** This function does the opposite operation of esp_eth_start.

**Return**

- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
- ESP_FAIL: stop esp_eth driver failed because some other error occurred

**Parameters**

- hdl: handle of Ethernet driver

**esp_err_t esp_eth_update_input_path (esp_eth_handle_t hdl, esp_err_t(*stack_input)(esp_eth_handle_t hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)**

Update Ethernet data input path (i.e. specify where to pass the input buffer)

**Note** After install driver, Ethernet still don’t know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

**Return**

- ESP_OK: update input path successfully
- ESP_ERR_INVALID_ARG: update input path failed because of some invalid argument
- ESP_FAIL: update input path failed because some other error occurred

**Parameters**

- hdl: handle of Ethernet driver
- stack_input: function pointer, which does the actual process on incoming packets
- priv: private resource, which gets passed to stack_input callback without any modification

**esp_err_t esp_eth_transmit (esp_eth_handle_t hdl, void *buf, uint32_t length)**

General Transmit.
Return

- ESP_OK: transmit frame buffer successfully
- ESP_ERR_INVALID_ARG: transmit frame buffer failed because of some invalid argument
- ESP_FAIL: transmit frame buffer failed because some other error occurred

Parameters

- hdl: handle of Ethernet driver
- buf: buffer of the packet to transfer
- length: length of the buffer to transfer

```c
esp_err_t esp_eth_receive (esp_eth_handle_t hdl, uint8_t *buf, uint32_t *length)
```

General Receive.

Note Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

Return

- ESP_OK: receive frame buffer successfully
- ESP_ERR_INVALID_ARG: receive frame buffer failed because of some invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive frame buffer failed because some other error occurred

Parameters

- hdl: handle of Ethernet driver
- buf: buffer to preserve the received packet
- length: length of the received packet

```c
esp_err_t esp_eth_ioctl (esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void *data)
```

Misc IO function of Etherent driver.

Return

- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred

Parameters

- hdl: handle of Ethernet driver
- cmd: IO control command
- data: specified data for command

```c
esp_err_t esp_eth_increase_reference (esp_eth_handle_t hdl)
```

Increase Ethernet driver reference.
Note Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won’t be uninstalled during your using time.

Return

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Parameters

- hdl: handle of Ethernet driver

\[
\text{esp_err_t esp_eth_decrease_reference(esp_eth_handle_t hdl)}
\]

Decrease Ethernet driver reference.

Return

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Parameters

- hdl: handle of Ethernet driver

Structures

\[
\text{struct esp_eth_config_t}
\]

Configuration of Ethernet driver.

Public Members

- \text{esp_eth_mac_t *mac}
  Ethernet MAC object.
- \text{esp_eth_phy_t *phy}
  Ethernet PHY object.
- uint32_t check_link_period_ms
  Period time of checking Ethernet link status.
- \text{esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t *buffer, uint32_t length, void *priv)}
  Input frame buffer to user’s stack.

Return

- ESP_OK: input frame buffer to upper stack successfully
- ESP_FAIL: error occurred when inputting buffer to upper stack

Parameters

- eth_handle: handle of Ethernet driver
- buffer: frame buffer that will get input to upper stack
- length: length of the frame buffer
esp_err_t (*on_lowlevel_init_done)(esp_eth_handle_t eth_handle)
Callback function invoked when lowlevel initialization is finished.

Return
• ESP_OK: process extra lowlevel initialization successfully
• ESP_FAIL: error occurred when processing extra lowlevel initialization

Parameters
• eth_handle: handle of Ethernet driver

esp_err_t (*on_lowlevel_deinit_done)(esp_eth_handle_t eth_handle)
Callback function invoked when lowlevel deinitialization is finished.

Return
• ESP_OK: process extra lowlevel deinitialization successfully
• ESP_FAIL: error occurred when processing extra lowlevel deinitialization

Parameters
• eth_handle: handle of Ethernet driver

Macros

ETH_DEFAULT_CONFIG(emac, ephy)
Default configuration for Ethernet driver.

Type Definitions

typedef void *esp_eth_handle_t
Handle of Ethernet driver.

API Reference - Common Interface

Header File
• esp_eth/include/esp_eth_com.h

Functions

esp_err_t esp_eth_detect_phy_addr (esp_eth_mediator_t *eth, uint32_t *detected_addr)
Detect PHY address.

Return
• ESP_OK: detect phy address successfully
• ESP_ERR_INVALID_ARG: invalid parameter
• ESP_ERR_NOT_FOUND: can’t detect any PHY device
• ESP_FAIL: detect phy address failed because some error occurred
Parameters

- `eth`: mediator of Ethernet driver
- `detected_addr`: a valid address after detection

Structures

```c
struct esp_eth_mediator_s
    Ethernet mediator.
```

Public Members

```c
esp_err_t (*phy_reg_read)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```

Read PHY register.

Return

- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred

Parameters

- `eth`: mediator of Ethernet driver
- `phy_addr`: PHY Chip address (0~31)
- `phy_reg`: PHY register index code
- `reg_value`: PHY register value

```c
esp_err_t (*phy_reg_write)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```

Write PHY register.

Return

- ESP_OK: write PHY register successfully
- ESP_FAIL: write PHY register failed because some error occurred

Parameters

- `eth`: mediator of Ethernet driver
- `phy_addr`: PHY Chip address (0~31)
- `phy_reg`: PHY register index code
- `reg_value`: PHY register value

```c
esp_err_t (*stack_input)(esp_eth_mediator_t *eth, uint8_t *buffer, uint32_t length)
```

Deliver packet to upper stack.

Return

- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred
Parameters

- `eth`: mediator of Ethernet driver
- `buffer`: packet buffer
- `length`: length of the packet

```c
esp_err_t (*on_state_changed)(esp_eth_mediator_t *eth, esp_eth_state_t state, void *args)
```

Callback on Ethernet state changed.

Return

- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

Parameters

- `eth`: mediator of Ethernet driver
- `state`: new state
- `args`: optional argument for the new state

Macros

```c
#define ETH_MAX_PAYLOAD_LEN
Maximum Ethernet payload size.
#define ETH_MIN_PAYLOAD_LEN
Minimum Ethernet payload size.
#define ETH_HEADER_LEN
Ethernet frame header size: Dest addr(6 Bytes) + Src addr(6 Bytes) + length/type(2 Bytes)
#define ETH_CRC_LEN
Ethernet frame CRC length.
#define ETH_VLAN_TAG_LEN
Optional 802.1q VLAN Tag length.
#define ETH_JUMBO_FRAME_PAYLOAD_LEN
Jumbo frame payload size.
#define ETH_MAX_PACKET_SIZE
Maximum frame size (1522 Bytes)
#define ETH_MIN_PACKET_SIZE
Minimum frame size (64 Bytes)
```

Type Definitions

```c
typedef struct esp_eth_mediator_s esp_eth_mediator_t
Ethernet mediator.
```
Enumerations

```c
enum esp_eth_state_t
    Ethernet driver state.
    Values:
    ETH_STATE_LLINIT
        Lowlevel init done
    ETH_STATE_DEINIT
        Deinit done
    ETH_STATE_LINK
        Link status changed
    ETH_STATE_SPEED
        Speed updated
    ETH_STATE_DUPLEX
        Duplex updated

enum esp_eth_io_cmd_t
    Command list for ioctl API.
    Values:
    ETH_CMD_G_MAC_ADDR
        Get MAC address
    ETH_CMD_S_MAC_ADDR
        Set MAC address
    ETH_CMD_G_PHY_ADDR
        Get PHY address
    ETH_CMD_S_PHY_ADDR
        Set PHY address
    ETH_CMD_G_SPEED
        Get Speed
    ETH_CMD_S_PROMISCUOUS
        Set promiscuous mode

enum eth_link_t
    Ethernet link status.
    Values:
    ETH_LINK_UP
        Ethernet link is up
    ETH_LINK_DOWN
        Ethernet link is down

enum eth_speed_t
    Ethernet speed.
    Values:
    ETH_SPEED_10M
        Ethernet speed is 10Mbps
```
**ETH_SPEED_100M**  
Ethernet speed is 100Mbps

**enum eth_duplex_t**  
Ethernet duplex mode.  
*Values:*  
**ETH_DUPLEX_HALF**  
Ethernet is in half duplex  
**ETH_DUPLEX_FULL**  
Ethernet is in full duplex

**enum eth_event_t**  
Ethernet event declarations.  
*Values:*  
**ETHERNET_EVENT_START**  
Ethernet driver start  
**ETHERNET_EVENT_STOP**  
Ethernet driver stop  
**ETHERNET_EVENT_CONNECTED**  
Ethernet got a valid link  
**ETHERNET_EVENT_DISCONNECTED**  
Ethernet lost a valid link

**API Reference - MAC Interface**

**Header File**

- esp_eth/include/esp_eth_mac.h

**Structures**

**struct esp_eth_mac_s**  
Ethernet MAC.

**Public Members**

`esp_err_t (*set_mediator)(esp_eth_mac_t *mac, esp_eth_mediator_t *eth)`  
Set mediator for Ethernet MAC.

**Return**

- ESP_OK: set mediator for Ethernet MAC successfully  
- ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

**Parameters**

- mac: Ethernet MAC instance  
- eth: Ethernet mediator

2.2. Networking APIs 645
**esp_err_t** (*init*) (esp_eth_mac_t *mac)
Initialize Ethernet MAC.

**Return**
- ESP_OK: initialize Ethernet MAC successfully
- ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

**Parameters**
- mac: Ethernet MAC instance

**esp_err_t** (*deinit*) (esp_eth_mac_t *mac)
Deinitialize Ethernet MAC.

**Return**
- ESP_OK: deinitialize Ethernet MAC successfully
- ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred

**Parameters**
- mac: Ethernet MAC instance

**esp_err_t** (*start*) (esp_eth_mac_t *mac)
Start Ethernet MAC.

**Return**
- ESP_OK: start Ethernet MAC successfully
- ESP_FAIL: start Ethernet MAC failed because some other error occurred

**Parameters**
- mac: Ethernet MAC instance

**esp_err_t** (*stop*) (esp_eth_mac_t *mac)
Stop Ethernet MAC.

**Return**
- ESP_OK: stop Ethernet MAC successfully
- ESP_FAIL: stop Ethernet MAC failed because some error occurred

**Parameters**
- mac: Ethernet MAC instance

**esp_err_t** (*transmit*) (esp_eth_mac_t *mac, uint8_t *buf, uint32_t length)
Transmit packet from Ethernet MAC.

**Return**
- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_ARG: transmit packet failed because of invalid argument
- ESP_ERR_INVALID_STATE: transmit packet failed because of wrong state of MAC
• ESP_FAIL: transmit packet failed because some other error occurred

Parameters
• mac: Ethernet MAC instance
• buf: packet buffer to transmit
• length: length of packet

```
esp_err_t (*receive)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t *length)
```
Receive packet from Ethernet MAC.

Note Memory of buf is allocated in the Layer2, make sure it get free after process.

Note Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

Return
• ESP_OK: receive packet successfully
• ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
• ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
• ESP_FAIL: receive packet failed because some other error occurred

Parameters
• mac: Ethernet MAC instance
• buf: packet buffer which will preserve the received frame
• length: length of the received packet

```
esp_err_t (*read_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```
Read PHY register.

Return
• ESP_OK: read PHY register successfully
• ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
• ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
• ESP_ERR_TIMEOUT: read PHY register failed because of timeout
• ESP_FAIL: read PHY register failed because some other error occurred

Parameters
• mac: Ethernet MAC instance
• phy_addr: PHY chip address (0~31)
• phy_reg: PHY register index code
• reg_value: PHY register value

```
esp_err_t (*write_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```
Write PHY register.
Return

- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

Parameters

- **mac**: Ethernet MAC instance
- **phy_addr**: PHY chip address (0~31)
- **phy_reg**: PHY register index code
- **reg_value**: PHY register value

```c
esp_err_t (*set_addr)(esp_eth_mac_t *mac, uint8_t *addr)
```

Set MAC address.

Return

- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
- ESP_FAIL: set MAC address failed because some other error occurred

Parameters

- **mac**: Ethernet MAC instance
- **addr**: MAC address

```c
esp_err_t (*get_addr)(esp_eth_mac_t *mac, uint8_t *addr)
```

Get MAC address.

Return

- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
- ESP_FAIL: get MAC address failed because some other error occurred

Parameters

- **mac**: Ethernet MAC instance
- **addr**: MAC address

```c
esp_err_t (*set_speed)(esp_eth_mac_t *mac, eth_speed_t speed)
```

Set speed of MAC.

Return

- ESP_OK: set MAC speed successfully
- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

Parameters

- **mac**: Ethernet MAC instance
- **speed**: MAC speed
• `mac`: Ethernet MAC instance
• `speed`: MAC speed

```c
esp_err_t (*set_duplex)(esp_eth_mac_t *mac, eth_duplex_t duplex)
```
Set duplex mode of MAC.

Return
- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

Parameters
- `mac`: Ethernet MAC instance
- `duplex`: MAC duplex

```c
esp_err_t (*set_link)(esp_eth_mac_t *mac, eth_link_t link)
```
Set link status of MAC.

Return
- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

Parameters
- `mac`: Ethernet MAC instance
- `link`: Link status

```c
esp_err_t (*set_promiscuous)(esp_eth_mac_t *mac, bool enable)
```
Set promiscuous of MAC.

Return
- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some error occurred

Parameters
- `mac`: Ethernet MAC instance
- `enable`: set true to enable promiscuous mode; set false to disable promiscuous mode

```c
esp_err_t (*del)(esp_eth_mac_t *mac)
```
Free memory of Ethernet MAC.

Return
- ESP_OK: free Ethernet MAC instance successfully
- ESP_FAIL: free Ethernet MAC instance failed because some error occurred

Parameters
- `mac`: Ethernet MAC instance
struct eth_mac_config_t
Configuration of Ethernet MAC object.

Public Members

uint32_t sw_reset_timeout_ms
Software reset timeout value (Unit: ms)

uint32_t rx_task_stack_size
Stack size of the receive task

uint32_t rx_task_prio
Priority of the receive task

int smi_mdc_gpio_num
SMI MDC GPIO number

int smi_mdio_gpio_num
SMI MDIO GPIO number

uint32_t flags
Flags that specify extra capability for mac driver

Macros

ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE
MAC driver can work when cache is disabled

ETH_MAC_DEFAULT_CONFIG()
Default configuration for Ethernet MAC object.

Type Definitions

typedef struct esp_eth_mac_s esp_eth_mac_t
Ethernet MAC.

API Reference - PHY Interface

Header File

• esp_eth/include/esp_eth_phy.h

Functions

esp_eth_phy_t *esp_eth_phy_new_ip101(const eth_phy_config_t *config)
Create a PHY instance of IP101.

Return

• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred
Parameters

- `config`: configuration of PHY

```c
esp_eth_phy_t* esp_eth_phy_new_rtl8201(const eth_phy_config_t* config)
```
Create a PHY instance of RTL8201.

Return

- `instance`: create PHY instance successfully
- `NULL`: create PHY instance failed because some error occurred

Parameters

- `config`: configuration of PHY

```c
esp_eth_phy_t* esp_eth_phy_new_lan8720(const eth_phy_config_t* config)
```
Create a PHY instance of LAN8720.

Return

- `instance`: create PHY instance successfully
- `NULL`: create PHY instance failed because some error occurred

Parameters

- `config`: configuration of PHY

```c
esp_eth_phy_t* esp_eth_phy_new_dp83848(const eth_phy_config_t* config)
```
Create a PHY instance of DP83848.

Return

- `instance`: create PHY instance successfully
- `NULL`: create PHY instance failed because some error occurred

Parameters

- `config`: configuration of PHY

**Structures**

```c
struct esp_eth_phy_s
```
Ethernet PHY.

**Public Members**

```c
esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)
```
Set mediator for PHY.

Return

- `ESP_OK`: set mediator for Ethernet PHY instance successfully
- `ESP_ERR_INVALID_ARG`: set mediator for Ethernet PHY instance failed because of some invalid arguments
Parameters

• phy: Ethernet PHY instance
• mediator: mediator of Ethernet driver

```c
esp_err_t (*reset)(esp_eth_phy_t *phy)
```
Software Reset Ethernet PHY.

Return

• ESP_OK: reset Ethernet PHY successfully
• ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters

• phy: Ethernet PHY instance

```c
esp_err_t (*reset_hw)(esp_eth_phy_t *phy)
```
Hardware Reset Ethernet PHY.

Note Hardware reset is mostly done by pull down and up PHY’s nRST pin

Return

• ESP_OK: reset Ethernet PHY successfully
• ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters

• phy: Ethernet PHY instance

```c
esp_err_t (*init)(esp_eth_phy_t *phy)
```
Initialize Ethernet PHY.

Return

• ESP_OK: initialize Ethernet PHY successfully
• ESP_FAIL: initialize Ethernet PHY failed because some error occurred

Parameters

• phy: Ethernet PHY instance

```c
esp_err_t (*deinit)(esp_eth_phy_t *phy)
```
Deinitialize Ethernet PHY.

Return

• ESP_OK: deinitialize Ethernet PHY successfully
• ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

Parameters

• phyL: Ethernet PHY instance

```c
esp_err_t (*negotiate)(esp_eth_phy_t *phy)
```
Start auto negotiation.
Return

- ESP_OK: restart auto negotiation successfully
- ESP_FAIL: restart auto negotiation failed because some error occurred

Parameters

- phy: Ethernet PHY instance

```c
esp_err_t (*get_link)(esp_eth_phy_t *phy)
```

Get Ethernet PHY link status.

Return

- ESP_OK: get Ethernet PHY link status successfully
- ESP_FAIL: get Ethernet PHY link status failed because some error occurred

Parameters

- phy: Ethernet PHY instance

```c
esp_err_t (*pwrctl)(esp_eth_phy_t *phy, bool enable)
```

Power control of Ethernet PHY.

Return

- ESP_OK: control Ethernet PHY power successfully
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

Parameters

- phy: Ethernet PHY instance
- enable: set true to power on Ethernet PHY; set false to power off Ethernet PHY

```c
esp_err_t (*set_addr)(esp_eth_phy_t *phy, uint32_t addr)
```

Set PHY chip address.

Return

- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

Parameters

- phy: Ethernet PHY instance
- addr: PHY chip address

```c
esp_err_t (*get_addr)(esp_eth_phy_t *phy, uint32_t *addr)
```

Get PHY chip address.

Return

- ESP_OK: get Ethernet PHY address successfully
- ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

Parameters

- phy: Ethernet PHY instance
• `addr` : PHY chip address

```c
esp_err_t (*del)(esp_eth_phy_t *phy)
```

Free memory of Ethernet PHY instance.

**Return**

• ESP_OK: free PHY instance successfully
• ESP_FAIL: free PHY instance failed because some error occurred

**Parameters**

• `phy` : Ethernet PHY instance

```c
struct eth_phy_config_t
```

Ethernet PHY configuration.

**Public Members**

- `int32_t phy_addr`
  PHY address, set -1 to enable PHY address detection at initialization stage
- `uint32_t reset_timeout_ms`
  Reset timeout value (Unit: ms)
- `uint32_t autonego_timeout_ms`
  Auto-negotiation timeout value (Unit: ms)
- `int reset_gpio_num`
  Reset GPIO number, -1 means no hardware reset

**Macros**

`ESP_ETH_PHY_ADDR_AUTO`

`ETH_PHY_DEFAULT_CONFIG()`

Default configuration for Ethernet PHY object.

**Type Definitions**

```c
typedef struct esp_eth_phy_s esp_eth_phy_t
```

Ethernet PHY.

**API Reference - Glue for esp_netif**

**Header File**

- esp_eth/include/esp_eth_netif_glue.h
Functions

```c
void *esp_eth_new_netif_glue(esp_eth_handle_t eth_hdl)
    Create a netif glue for Ethernet driver.

    Note netif glue is used to attach io driver to TCP/IP netif
    Return glue object, which inherits esp_netif_driver_base_t

    Parameters
    • eth_hdl: Ethernet driver handle
```

```c
esp_err_t esp_eth_del_netif_glue(void *glue)
    Delete netif glue of Ethernet driver.

    Return -ESP_OK: delete netif glue successfully

    Parameters
    • glue: netif glue
```

```c
esp_err_t esp_eth_set_default_handlers(void *esp_netif)
    Register default IP layer handlers for Ethernet.

    Note : Ethernet handle might not yet properly initialized when setting up these default handlers
    Return
    • ESP_ERR_INVALID_ARG: invalid parameter (esp_netif is NULL)
    • ESP_OK: set default IP layer handlers successfully
    • others: other failure occurred during register esp_event handler

    Parameters
    • esp_netif: esp network interface handle created for Ethernet driver
```

```c
esp_err_t esp_eth_clear_default_handlers(void *esp_netif)
    Unregister default IP layer handlers for Ethernet.

    Return
    • ESP_ERR_INVALID_ARG: invalid parameter (esp_netif is NULL)
    • ESP_OK: clear default IP layer handlers successfully
    • others: other failure occurred during unregister esp_event handler

    Parameters
    • esp_netif: esp network interface handle created for Ethernet driver
```

Code examples for the Ethernet API are provided in the ethernet directory of ESP-IDF examples.
2.2.3 IP Network Layer

ESP-NETIF

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF component is a successor of the tcpip_adapter, former network interface abstraction, which has become deprecated since IDF v4.1. Please refer to the TCP/IP Adapter Migration Guide section in case existing applications to be ported to use the esp-netif API instead.

ESP-NETIF architecture
Data and event flow in the diagram

- . . . . . . . Initialization line from user code to ESP-NETIF and communication driver
- --<--->-- Data packets going from communication media to TCP/IP stack and back
- * * * * * * * Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

ESP-NETIF interaction

A) User code, boiler plate

Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code

1) Initializes IO driver

2) Creates a new instance of ESP-NETIF and configure with
   - ESP-NETIF specific options (flags, behaviour, name)
   - Network stack options (netif init and input functions, not publicly available)
   - IO driver specific options (transmit, free rx buffer functions, IO driver handle)

3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps

4) Configures event handlers
   - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
   - register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

B) Communication driver, IO driver, media driver

Communication driver plays these two important roles in relation with ESP-NETIF:

1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)

2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
   - Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
   - Calls esp_netif_receive() to pass incoming data to network stack
C) ESP-NETIF, former tcpip_adapter

ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

1) Initialization APIs (to create and configure ESP-NETIF instance)
2) Input/Output API (for passing data between IO driver and network stack)
3) Event or Action API
   • Used for network interface lifecycle management
   • ESP-NETIF provides building blocks for designing event handlers
4) Setters and Getters for basic network interface properties
5) Network stack abstraction: enabling user interaction with TCP/IP stack
   • Set interface up or down
   • DHCP server and client API
   • DNS API
6) Driver conversion utilities

D) Network stack

Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

ESP-NETIF programmer's manual

Please refer to the example section for basic initialization of default interfaces:

• WiFi Station: examples/wifi/getting_started/station/main/station_example_main.c
• WiFi Access Point: examples/wifi/getting_started/softAP/main/softap_example_main.c
• Ethernet examples/ethernet/basic/main/ethernet_example_main.c

For more specific cases please consult this guide: ESP-NETIF Custom I/O Driver.

WiFi default initialization

The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in two separate APIs to facilitate simple startup code for most applications:

• esp_netif_create_default_wifi_ap()
• esp_netif_create_default_wifi_sta()

Please note that these functions return the esp_netif handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

• The created object has to be destroyed if a network de-initialization is provided by an application.
• These default interfaces must not be created multiple times, unless the created handle is deleted using esp_netif_destroy().
• When using Wifi in AP+STA mode, both these interfaces has to be created.

API Reference

Header File

• esp_netif/include/esp_netif.h

Functions

```c
esp_err_t esp_netif_init(void)
Initialize the underlying TCP/IP stack.

Return
• ESP_OK on success
• ESP_FAIL if initializing failed

Note This function should be called exactly once from application code, when the application starts up.
```

```c
esp_err_t esp_netif_deinit(void)
Deinitialize the esp-netif component (and the underlying TCP/IP stack)

Note: Deinitialization is not supported yet

Return
• ESP_ERR_INVALID_STATE if esp_netif not initialized
• ESP_ERR_NOT_SUPPORTED otherwise
```

```c
esp_netif_t *esp_netif_new(const esp_netif_config_t *esp_netif_config)
Creates an instance of new esp-netif object based on provided config.

Return
• pointer to esp-netif object on success
• NULL otherwise

Parameters
• esp_netif_config: pointer esp-netif configuration
```

```c
void esp_netif_destroy(esp_netif_t *esp_netif)
Destroys the esp_netif object.

Parameters
• esp_netif: pointer to the object to be deleted
```

```c
esp_err_t esp_netif_set_driver_config(esp_netif_t *esp_netif, const esp_netif_driver_ifconfig_t *driver_config)
Configures driver related options of esp_netif object.
```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle driver_handle)

Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

Return
• ESP_OK on success
• ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver’s post_attach callback failed

Parameters
• esp_netif: pointer to the object to be configured
• driver_config: pointer esp-netif io driver related configuration

esp_err_t esp_netif_receive(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)

Passes the raw packets from communication media to the appropriate TCP/IP stack. This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

Return
• ESP_OK

Parameters
• esp_netif: Handle to esp-netif instance
• buffer: Received data
• len: Length of the data frame
• eb: Pointer to internal buffer (used in Wi-Fi driver)

void esp_netif_action_start (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver start event. Creates network interface, if AUTOUP enabled turns the interface on, if DHCP enabled starts dhcp server.

Note This API can be directly used as event handler

Parameters
• esp_netif: Handle to esp-netif instance
• base:
• event_id:
• data:

```c
void esp_netif_action_stop(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IO driver stop event.

**Note** This API can be directly used as event handler

**Parameters**

- `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

```c
void esp_netif_action_connected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IO driver connected event.

**Note** This API can be directly used as event handler

**Parameters**

- `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

```c
void esp_netif_action_disconnected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IO driver disconnected event.

**Note** This API can be directly used as event handler

**Parameters**

- `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

```c
void esp_netif_action_got_ip(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon network got IP event.

**Note** This API can be directly used as event handler

**Parameters**

- `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:
`esp_err_t esp_netif_set_mac`(esp_netif_t *esp_netif, uint8_t mac[])  
Set the mac address for the interface instance.

**Return**  
ESP_OK

**Parameters**  
- esp_netif: Handle to esp-netif instance  
- mac: Desired mac address for the related network interface

`esp_err_t esp_netif_set_hostname`(esp_netif_t *esp_netif, const char *hostname)  
Set the hostname of an interface.

**Return**  
- ESP_OK - success  
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error  
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

**Parameters**  
- esp_netif: Handle to esp-netif instance  

`esp_err_t esp_netif_get_hostname`(esp_netif_t *esp_netif, const char **hostname)  
Get interface hostname.

**Return**  
- ESP_OK - success  
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error  
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

**Parameters**  
- esp_netif: Handle to esp-netif instance  
- hostname: Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NUL, pointer remains valid (and string may change if the hostname changes).

`bool esp_netif_is_netif_up`(esp_netif_t *esp_netif)  
Test if supplied interface is up or down.

**Return**  
- true - Interface is up  
- false - Interface is down

**Parameters**  
- esp_netif: Handle to esp-netif instance

`esp_err_t esp_netif_get_ip_info`(esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)  
Get interface’s IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance
Return

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters

- esp_netif: Handle to esp-netif instance
- ip_info: If successful, IP information will be returned in this argument.

\texttt{esp_err_t esp_netif_get_old_ip_info} (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)

Get interface’s old IP information.

Returns an “old” IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

Return

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters

- esp_netif: Handle to esp-netif instance
- ip_info: If successful, IP information will be returned in this argument.

\texttt{esp_err_t esp_netif_set_ip_info} (esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)

Set interface’s IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

\textbf{Note} DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

\textbf{Note} Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

Return

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

Parameters

- esp_netif: Handle to esp-netif instance
- ip_info: IP information to set on the specified interface

\texttt{esp_err_t esp_netif_set_old_ip_info} (esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

2.2. Networking APIs
Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

Return

• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters

• esp_netif: Handle to esp-netif instance
• ip_info: Store the old IP information for the specified interface

int esp_netif_get_netif_impl_index (esp_netif_t *esp_netif)
Get net interface index from network stack implementation.

Note  This index could be used in setsockopt() to bind socket with multicast interface

Return  implementation specific index of interface represented with supplied esp_netif

Parameters

• esp_netif: Handle to esp-netif instance

esp_err_t esp_netif_dhcps_option (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
Set or Get DHCP server option.

Return

• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

Parameters

• esp_netif: Handle to esp-netif instance
• opt_op: ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
• opt_id: Option index to get or set, must be one of the supported enum values.
• opt_val: Pointer to the option parameter.
• opt_len: Length of the option parameter.

esp_err_t esp_netif_dhcpc_option (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
Set or Get DHCP client option.

Return

• ESP_OK
Read the Docs Template Documentation, Release v4.1

- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

Parameters
- `esp_netif`: Handle to esp-netif instance
- `opt_op`: ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- `opt_id`: Option index to get or set, must be one of the supported enum values.
- `opt_val`: Pointer to the option parameter.
- `opt_len`: Length of the option parameter.

`esp_err_t esp_netif_dhcpc_start(esp_netif_t *esp_netif)`
Start DHCP client (only if enabled in interface object)

Note The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

Return
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_DHCPC_START_FAILED

Parameters
- `esp_netif`: Handle to esp-netif instance

`esp_err_t esp_netif_dhcpc_stop(esp_netif_t *esp_netif)`
Stop DHCP client (only if enabled in interface object)

Note Calling action_netif_stop() will also stop the DHCP Client if it is running.

Return
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

Parameters
- `esp_netif`: Handle to esp-netif instance

`esp_err_t esp_netif_dhcpc_get_status(esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)`
Get DHCP client status.

Return
- ESP_OK

Parameters
• `esp_netif`: Handle to esp-netif instance
• `status`: If successful, the status of DHCP client will be returned in this argument.

```c
esp_err_t esp_netif_dhcps_get_status(esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)
```
Get DHCP Server status.

**Return**
• ESP_OK

**Parameters**
• `esp_netif`: Handle to esp-netif instance
• `status`: If successful, the status of the DHCP server will be returned in this argument.

```c
esp_err_t esp_netif_dhcps_start(esp_netif_t *esp_netif)
```
Start DHCP server (only if enabled in interface object)

**Return**
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**
• `esp_netif`: Handle to esp-netif instance

```c
esp_err_t esp_netif_dhcps_stop(esp_netif_t *esp_netif)
```
Stop DHCP server (only if enabled in interface object)

**Return**
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
• ESP_ERR_ESP_NETIF_IF_NOT_READY

**Parameters**
• `esp_netif`: Handle to esp-netif instance

```c
esp_err_t esp_netif_set_dns_info(esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)
```
Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

• The default Main DNS server is typically the IP of the Wi-Fi AP interface itself.
• This function can override it by setting server type ESP_NETIF_DNS_MAIN.

---

666 Chapter 2. API Reference
• Other DNS Server types are not supported for the Wi-Fi AP interface.

Return

• ESP_OK on success
• ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

Parameters

• esp_netif: Handle to esp-netif instance
• type: Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
• dns: DNS Server address to set

```c
esp_err_t esp_netif_get_dns_info(esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)
```

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface’s DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

Return

• ESP_OK on success
• ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

Parameters

• esp_netif: Handle to esp-netif instance
• type: Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
• dns: DNS Server result is written here on success

```c
esp_err_t esp_netif_create_ip6_linklocal(esp_netif_t *esp_netif)
```

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

Return

• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters

• esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_get_ip6_linklocal(esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.
Return

• ESP_OK
• ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

Parameters

• esp_netif: Handle to esp_netif instance
• if_ip6: IPv6 information will be returned in this argument if successful.

\[ \text{esp_err_t} \ \text{esp_netif_get_ip6_global} (\text{esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6}) \]

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

Return

• ESP_OK
• ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

Parameters

• esp_netif: Handle to esp_netif instance
• if_ip6: IPv6 information will be returned in this argument if successful.

\[ \text{void} \ \text{esp_netif_set_ip4_addr} (\text{esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d}) \]

Sets IPv4 address to the specified octets.

Parameters

• addr: IP address to be set
• a: the first octet (127 for IP 127.0.0.1)
• b:
• c:
• d:

\[ \text{char *} \ \text{esp_ip4addr_ntoa} (\text{const esp_ip4_addr_t *addr, char *buf, int buflen}) \]

Converts numeric IP address into decimal dotted ASCII representation.

Return either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

Parameters

• addr: ip address in network order to convert
• buf: target buffer where the string is stored
• buflen: length of buf

\[ \text{uint32_t} \ \text{esp_ip4addr_aton} (\text{const char *addr}) \]

Ascii internet address interpretation routine The value returned is in network order.

Return ip address in network order
Parameters

- **addr**: IP address in ascii representation (e.g. “127.0.0.1”)

`esp_netif_iodriver_handle esp_netif_get_io_driver (esp_netif_t *esp_netif)`

Gets media driver handle for this esp-netif instance.

**Return** opaque pointer of related IO driver

**Parameters**

- **esp_netif**: Handle to esp-netif instance

`esp_netif_t *esp_netif_get_handle_from_ifkey (const char *if_key)`

Searches over a list of created objects to find an instance with supplied if key.

**Return** Handle to esp-netif instance

**Parameters**

- **if_key**: Textual description of network interface

`esp_netif_flags_t esp_netif_get_flags (esp_netif_t *esp_netif)`

Returns configured flags for this interface.

**Return** Configuration flags

**Parameters**

- **esp_netif**: Handle to esp-netif instance

`const char *esp_netif_get_ifkey (esp_netif_t *esp_netif)`

Returns configured interface key for this esp-netif instance.

**Return** Textual description of related interface

**Parameters**

- **esp_netif**: Handle to esp-netif instance

`const char *esp_netif_get_desc (esp_netif_t *esp_netif)`

Returns configured interface type for this esp-netif instance.

**Return** Enumerated type of this interface, such as station, AP, ethernet

**Parameters**

- **esp_netif**: Handle to esp-netif instance

`int32_t esp_netif_get_event_id (esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)`

Returns configured event for this esp-netif instance and supplied event type.

**Return** specific event id which is configured to be raised if the interface lost or acquired IP address -1 if supplied event_type is not known

**Parameters**

- **esp_netif**: Handle to esp-netif instance

- **event_type**: (either get or lost IP)
esp_netif_t *\texttt{esp_netif_next}(esp_netif_t *\texttt{esp_netif})
Iterates over list of interfaces. Returns first netif if NULL given as parameter.

\begin{description}
\item[Return] First netif from the list if supplied parameter is NULL, next one otherwise
\end{description}

\begin{description}
\item[Parameters]
\begin{itemize}
\item \texttt{esp_netif}: Handle to esp-netif instance
\end{itemize}
\end{description}

size_t \texttt{esp_netif_get_nr_of_ifs} (void)
Returns number of registered esp_netif objects.

\begin{description}
\item[Return] Number of esp_netifs
\end{description}

\section*{WiFi default API reference}

\subsection*{Header File}

\begin{itemize}
\item \texttt{esp_wifi/include/esp_wifi_default.h}
\end{itemize}

\subsection*{Functions}

\begin{description}
\item[\texttt{esp_err_t \texttt{esp_netif_attach_wifi_station}}(esp_netif_t *\texttt{esp_netif})]
Attaches wifi station interface to supplied netif.

\begin{description}
\item[Return]
\begin{itemize}
\item ESP_OK on success
\item ESP_FAIL if attach failed
\end{itemize}
\end{description}

\item[Parameters]
\begin{itemize}
\item \texttt{esp_netif}: instance to attach the wifi station to
\end{itemize}
\end{description}

\begin{description}
\item[\texttt{esp_err_t \texttt{esp_netif_attach_wifi_ap}}(esp_netif_t *\texttt{esp_netif})]
Attaches wifi soft AP interface to supplied netif.

\begin{description}
\item[Return]
\begin{itemize}
\item ESP_OK on success
\item ESP_FAIL if attach failed
\end{itemize}
\end{description}

\item[Parameters]
\begin{itemize}
\item \texttt{esp_netif}: instance to attach the wifi AP to
\end{itemize}
\end{description}

\begin{description}
\item[\texttt{esp_err_t \texttt{esp_wifi_set_default_wifi_sta_handlers}}(void)]
Sets default wifi event handlers for STA interface.

\begin{description}
\item[Return]
\begin{itemize}
\item ESP_OK on success, error returned from esp_event_handler_register if failed
\end{itemize}
\end{description}

\item[\texttt{esp_err_t \texttt{esp_wifi_set_default_wifi_ap_handlers}}(void)]
Sets default wifi event handlers for STA interface.
Return

- ESP_OK on success, error returned from esp_event_handler_register if failed

```c
esp_err_t esp_wifi_clear_default_wifi_driver_and_handlers(void *esp_netif)
```

Clears default wifi event handlers for supplied network interface.

Return

- ESP_OK on success, error returned from esp_event_handler_register if failed

Parameters

- esp_netif: instance of corresponding if object

```c
esp_netif_t *esp_netif_create_default_wifi_ap(void)
```

Creates default WIFI AP. In case of any init error this API aborts.

Return  pointer to esp-netif instance

```c
esp_netif_t *esp_netif_create_default_wifi_sta(void)
```

Creates default WIFI STA. In case of any init error this API aborts.

Return  pointer to esp-netif instance

```c
esp_err_t esp_netif_create_default_wifi_mesh_netifs(esp_netif_t **p_netif_sta, esp_netif_t **p_netif_ap)
```

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

Return  ESP_OK on success

Parameters

- p_netif_sta: pointer where the resultant STA interface is saved (if non NULL)
- p_netif_ap: pointer where the resultant AP interface is saved (if non NULL)

TCP/IP Adapter Migration Guide

TCP/IP Adapter is a network interface abstraction component used in IDF prior to v4.1. This page outlines migration from tcpip_adapter API to its successor ESP-NETIF.

Updating network connection code

Network stack initialization

Simply replace tcpip_adapter_init() with esp_netif_init(). Please note that the ESP-NETIF initialization API returns standard error code and the esp_netif_deinit() for un-initialization is available.

Also replace #include "tcpip_adapter.h" with #include "esp_netif.h".
Network interface creation

TCP/IP Adapter defined these three interfaces statically:

- WiFi Station
- WiFi Access Point
- Ethernet

Network interface instance shall be explicitly constructed for the ESP-NETIF to enable its connection to the TCP/IP stack. For example initialization code for WiFi has to explicitly call esp_netif_create_default_wifi_sta(); or esp_netif_create_default_wifi_ap(); after the TCP/IP stack and the event loop have been initialized. Please consult an example initialization code for these three interfaces:

- WiFi Station: examples/wifi/getting_started/station/main/station_example_main.c
- WiFi Access Point: examples/wifi/getting_started/softAP/main/softap_example_main.c
- Ethernet examples/ethernet/basic/main/ethernet_example_main.c

Replacing other tcpip_adapter API

All the tcpip_adapter functions have their esp-netif counter-part. Please refer to the esp_netif.h grouped into these sections:

- Setters/Getters
- DHCP
- DNS
- IP address

Default event handlers

Event handlers are moved from tcpip_adapter to appropriate driver code. There is no change from application code perspective, all events shall be handled in the same way. Please note that within IP related event handlers, application code usually receives IP addresses in a form of esp-netif specific struct (not the LwIP structs, but binary compatible). This is the preferred way of printing the address:

```c
ESP_LOGI(TAG, "got ip:" IPSTR "\n", IP2STR(&event->ip_info.ip));
```

Instead of

```c
ESP_LOGI(TAG, "got ip:%s\n", ip4addr_ntoa(&event->ip_info.ip));
```

Since ip4addr_ntoa() is a LwIP API, the esp-netif provides esp_ip4addr_ntoa() as a replacement, but the above method is generally preferred.

IP addresses

It is preferred to use esp-netif defined IP structures. Please note that the LwIP structs will still work when default compatibility enabled. *esp-netif IP address definitions
Next steps

Additional step in porting an application to fully benefit from the ESP-NETIF is to disable the tcpip_adapter compatibility layer in the component configuration: ESP NETIF Adapter -> Enable backward compatible tcpip_adapter interface and check if the project compiles. TCP/IP adapter brings many include dependencies and this step might help in decoupling the application from using specific TCP/IP stack API directly.

ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver’s lifecycle transitions.

Packet input/output

As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver’s code simply calls `esp_netif_receive()` on a new data received event.

Post attach callback

A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver’s object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;    /!*< base structure reserved as esp-
    driver */
    driver_impl *h;                 /!*< handle of driver implementation_*/
} my_netif_driver_t;
```
with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver’s code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```c
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

**Default handlers**

I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example `driver start -> network start`, etc. An example of such a default handler is provided below:

```c
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

**Network stack connection**

The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.

**Header File**

- `esp_netif/include/esp_netif_net_stack.h`

**Functions**

```c
esp_netif_t *esp_netif_get_handle_from_netif_impl(void *dev)
    Returns esp-netif handle.
```
Return handle to related esp-netif instance

Parameters

- dev: opaque ptr to network interface of specific TCP/IP stack

```c
void *esp_netif_get_netif_impl(esp_netif_t *esp_netif)
```

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode

Return handle to related network stack netif handle

Parameters

- esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_transmit(esp_netif_t *esp_netif, void *data, size_t len)
```

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

Return ESP_OK on success, an error passed from the I/O driver otherwise

Parameters

- esp_netif: Handle to esp-netif instance
- data: Data to be transmitted
- len: Length of the data frame

```c
void esp_netif_free_rx_buffer(void *esp_netif, void *buffer)
```

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

Parameters

- esp_netif: Handle to esp-netif instance
- buffer: Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the protocols/sockets directory of ESP-IDF examples.

The TCP/IP Adapter (legacy network interface library) has been deprecated, please consult the TCP/IP Adapter Migration Guide to update existing IDF applications.

### 2.2.4 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in Application Protocols.

### 2.3 Peripherals API

[]
2.3.1 Analog to Digital Converter

Overview

The ESP32 integrates two 12-bit SAR (Successive Approximation Register) ADCs supporting a total of 18 measurement channels (analog enabled pins).

The ADC driver API supports ADC1 (8 channels, attached to GPIOs 32 - 39), and ADC2 (10 channels, attached to GPIOs 0, 2, 4, 12 - 15 and 25 - 27). However, the usage of ADC2 has some restrictions for the application:

1. ADC2 is used by the Wi-Fi driver. Therefore the application can only use ADC2 when the Wi-Fi driver has not started.

2. Some of the ADC2 pins are used as strapping pins (GPIO 0, 2, 15) thus cannot be used freely. Such is the case in the following official Development Kits:
   - ESP32 DevKitC: GPIO 0 cannot be used due to external auto program circuits.
   - ESP-WROVER-KIT: GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.

Configuration and Reading ADC

The ADC should be configured before reading is taken.

- For ADC1, configure desired precision and attenuation by calling functions `adc1_config_width()` and `adc1_config_channel_atten()`.

- For ADC2, configure the attenuation by `adc2_config_channel_atten()`. The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see `adc1_channel_t` and `adc2_channel_t`, set as a parameter of above functions.

Then it is possible to read ADC conversion result with `adc1_get_raw()` and `adc2_get_raw()`. Reading width of ADC2 should be set as a parameter of `adc2_get_raw()` instead of in the configuration functions.

**Note:** Since the ADC2 is shared with the WIFI module, which has higher priority, reading operation of `adc2_get_raw()` will fail between `esp_wifi_start()` and `esp_wifi_stop()`. Use the return code to see whether the reading is successful.

It is also possible to read the internal hall effect sensor via ADC1 by calling dedicated function `hall_sensor_read()`. Note that even the hall sensor is internal to ESP32, reading from it uses channels 0 and 3 of ADC1 (GPIO 36 and 39). Do not connect anything else to these pins and do not change their configuration. Otherwise it may affect the measurement of low value signal from the sensor.

This API provides convenient way to configure ADC1 for reading from ULP. To do so, call function `adc1_ulp_enable()` and then set precision and attenuation as discussed above.

There is another specific function `adc2_vref_to_gpio()` used to route internal reference voltage to a GPIO pin. It comes handy to calibrate ADC reading and this is discussed in section Minimizing Noise.

Application Examples

Reading voltage on ADC1 channel 0 (GPIO 36):
The input voltage in above example is from 0 to 1.1V (0 dB attenuation). The input range can be extended by setting higher attenuation, see \texttt{adc\_atten\_t}. An example using the ADC driver including calibration (discussed below) is available in esp-idf: \texttt{peripherals/adc}

Reading voltage on ADC2 channel 7 (GPIO 27):

```c
#include <driver/adc.h>
...
int read_raw;
adc2_config_channel_atten( ADC2\_CHANNEL\_7, ADC\_ATTEN\_0db );
esp\_err\_t r = adc2\_get\_raw( ADC2\_CHANNEL\_7, ADC\_WIDTH\_12Bit, &read\_raw);
if ( r == ESP\_OK ) {
    printf("%d\n", read\_raw);
} else if ( r == ESP\_ERR\_TIMEOUT ) {
    printf("ADC2 used by Wi-Fi.\n");
}
```

The reading may fail due to collision with Wi-Fi, should check it. An example using the ADC2 driver to read the output of DAC is available in esp-idf: \texttt{peripherals/dac}

Reading the internal hall effect sensor:

```c
#include <driver/adc.h>
...
adc1_config_width(ADC\_WIDTH\_BIT\_12);
int val = hall\_sensor\_read();
```

The value read in both these examples is 12 bits wide (range 0-4095).

**Minimizing Noise**

The ESP32 ADC can be sensitive to noise leading to large discrepancies in ADC readings. To minimize noise, users may connect a 0.1uF capacitor to the ADC input pad in use. Multisampling may also be used to further mitigate the effects of noise.

**ADC Calibration**

The \texttt{esp\_adc\_cal/include/esp\_adc\_cal.h} API provides functions to correct for differences in measured voltages caused by variation of ADC reference voltages (Vref) between chips. Per design the ADC reference voltage is 1100mV, however the true reference voltage can range from 1000mV to 1200mV amongst different ESP32s.

Correcting ADC readings using this API involves characterizing one of the ADCs at a given attenuation to obtain a characteristics curve (ADC-Voltage curve) that takes into account the difference in ADC reference voltage. The
Fig. 4: Graph illustrating noise mitigation using capacitor and multisampling of 64 samples.

Fig. 5: Graph illustrating effect of differing reference voltages on the ADC voltage curve.
characteristics curve is in the form of \( y = \text{coeff}_a \times x + \text{coeff}_b \) and is used to convert ADC readings to voltages in mV. Calculation of the characteristics curve is based on calibration values which can be stored in eFuse or provided by the user.

**Calibration Values**

Calibration values are used to generate characteristic curves that account for the unique ADC reference voltage of a particular ESP32. There are currently three sources of calibration values. The availability of these calibration values will depend on the type and production date of the ESP32 chip/module.

- **Two Point** values represent each of the ADCs’ readings at 150mV and 850mV. To obtain more accurate calibration results these values should be measured by user and burned into eFuse BLOCK3.
- **eFuse Vref** represents the true ADC reference voltage. This value is measured and burned into eFuse BLOCK0 during factory calibration.
- **Default Vref** is an estimate of the ADC reference voltage provided by the user as a parameter during characterization. If Two Point or eFuse Vref values are unavailable, Default Vref will be used.

Individual measurement and burning of the **eFuse Vref** has been applied to ESP32-D0WD and ESP32-D0WDQ6 chips produced on/after the 1st week of 2018. Such chips may be recognized by date codes on/later than 012018 (see Line 4 on figure below).

![Fig. 6: ESP32 Chip Surface Marking](image)

If you would like to purchase chips or modules with calibration, double check with distributor or Espressif directly. If you are unable to check the date code (i.e. the chip may be enclosed inside a canned module, etc.), you can still verify if **eFuse Vref** is present by running `espefuse.py` tool with `adc_info` parameter

```
$IDF_PATH/components/esptool_py/esptool/espefuse.py --port /dev/ttyUSB0 adc_info
```

Replace `/dev/ttyUSB0` with ESP32 board’s port name.

A chip that has specific **eFuse Vref** value programmed (in this case 1093mV) will be reported as follows:
ADC VRef calibration: 1093mV

In another example below the eFuse Vref is not programmed:

ADC VRef calibration: None (1100mV nominal)

For a chip with two point calibration the message will look similar to:

ADC VRef calibration: 1149mV
ADC readings stored in efuse BLK3:
  ADC1 Low reading (150mV): 306
  ADC1 High reading (850mV): 3153
  ADC2 Low reading (150mV): 389
  ADC2 High reading (850mV): 3206

Application Example

For a full example see esp-idf: peripherals/adc

Characterizing an ADC at a particular attenuation:

```c
#include "driver/adc.h"
#include "esp_adc_cal.h"
...

//Characterize ADC at particular atten
esp_adc_cal_characteristics_t *adc_chars = calloc(1, sizeof(esp_adc_cal_characteristics_t));
esp_adc_cal_value_t val_type = esp_adc_cal_characterize(unit, atten, ADC_WIDTH_BIT_12, DEFAULT_VREF, adc_chars);
//Check type of calibration value used to characterize ADC
if (val_type == ESP_ADC_CAL_VAL_EFUSE_VREF) {
    printf("eFuse Vref");
} else if (val_type == ESP_ADC_CAL_VAL_EFUSE_TP) {
    printf("Two Point");
} else {
    printf("Default");
}
```

Reading an ADC then converting the reading to a voltage:

```c
#include "driver/adc.h"
#include "esp_adc_cal.h"
...
uint32_t reading = adc1_get_raw(ADC1_CHANNEL_5);
uint32_t voltage = esp_adc_cal_raw_to_voltage(reading, adc_chars);
```

Routing ADC reference voltage to GPIO, so it can be manually measured (for Default Vref):

```c
#include "driver/adc.h"
...

esp_err_t status = adc2_vref_to_gpio(GPIO_NUM_25);
```

(continues on next page)
if (status == ESP_OK) {
    printf("v_ref routed to GPIO\n");
} else {
    printf("failed to route v_ref\n");
}

GPIO Lookup Macros

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.

1. ADC1_CHANNEL_0_GPIO_NUM is the GPIO number of ADC1 channel 0 (36);
2. ADC1_GPIO32_CHANNEL is the ADC1 channel number of GPIO 32 (ADC1 channel 4).

API Reference

This reference covers three components:

• ADC driver
• ADC Calibration
• GPIO Lookup Macros

ADC driver

Header File

• driver/include/driver/adc.h

Functions

`esp_err_t adc1_pad_get_io_num(adc1_channel_t channel, gpio_num_t *gpio_num)`

Get the GPIO number of a specific ADC1 channel.

Return

• ESP_OK if success
• ESP_ERR_INVALID_ARG if channel not valid

Parameters

• channel: Channel to get the GPIO number
• gpio_num: output buffer to hold the GPIO number

`esp_err_t adc1_config_width(adc_bits_width_t width_bit)`

Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.

Return

• ESP_OK success
ESP_ERR_INVALID_ARG Parameter error

Parameters

- **width_bit**: Bit capture width for ADC1

`esp_err_t adc_set_data_width(adc_unit_t adc_unit, adc_bits_width_t width_bit)`

Configure ADC capture width.

**Return**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **adc_unit**: ADC unit index
- **width_bit**: Bit capture width for ADC unit.

`esp_err_t adc1_config_channel_atten(adc1_channel_t channel, adc_atten_t atten)`

Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

The default ADC full-scale voltage is 1.1 V. To read higher voltages (up to the pin maximum voltage, usually 3.3 V) requires setting >0 dB signal attenuation for that ADC channel.

**Note** For any given channel, this function must be called before the first time adc1_get_raw() is called for that channel.

**Note** This function can be called multiple times to configure multiple ADC channels simultaneously. adc1_get_raw() can then be called for any configured channel.

When VDD_A is 3.3 V:

- 0 dB attenuation (ADC_ATTEN_DB_0) gives full-scale voltage 1.1 V
- 2.5 dB attenuation (ADC_ATTEN_DB_2_5) gives full-scale voltage 1.5 V
- 6 dB attenuation (ADC_ATTEN_DB_6) gives full-scale voltage 2.2 V
- 11 dB attenuation (ADC_ATTEN_DB_11) gives full-scale voltage 3.9 V (see note below)

Due to ADC characteristics, most accurate results are obtained within the following approximate voltage ranges:

**Note** The full-scale voltage is the voltage corresponding to a maximum reading (depending on ADC1 configured bit width, this value is: 4095 for 12-bits, 2047 for 11-bits, 1023 for 10-bits, 511 for 9 bits.)

**Note** At 11 dB attenuation the maximum voltage is limited by VDD_A, not the full scale voltage.

- 0 dB attenuation (ADC_ATTEN_DB_0) between 100 and 950 mV
- 2.5 dB attenuation (ADC_ATTEN_DB_2_5) between 100 and 1250 mV
- 6 dB attenuation (ADC_ATTEN_DB_6) between 150 to 1750 mV
- 11 dB attenuation (ADC_ATTEN_DB_11) between 150 to 2450 mV

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Return**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `channel`: ADC1 channel to configure
- `atten`: Attenuation level

```c
int adc1_get_raw (adc1_channel_t channel)
```

Take an ADC1 reading from a single channel.

**Note** When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue.

**Note** Call `adc1_config_width()` before the first time this function is called.

**Note** For any given channel, `adc1_config_channel_atten(channel)` must be called before the first time this function is called. Configuring a new channel does not prevent a previously configured channel from being read.

**Return**

- -1: Parameter error
- Other: ADC1 channel reading.

**Parameters**

- `channel`: ADC1 channel to read

```c
void adc_power_on (void)
```

Enable ADC power.

```c
void adc_power_off (void)
```

Power off SAR ADC This function will force power down for ADC.

```c
esp_err_t adc_gpio_init (adc_unit_t adc_unit, adc_channel_t channel)
```

Initialize ADC pad.

**Return**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `adc_unit`: ADC unit index
- `channel`: ADC channel index

```c
esp_err_t adc_set_data_inv (adc_unit_t adc_unit, bool inv_en)
```

Set ADC data invert.

**Return**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

2.3. Peripherals API
• **adc_unit**: ADC unit index
• **inv_en**: whether enable data invert

```c
esp_err_t adc_set_clk_div(uint8_t clk_div)
```
Set ADC source clock.

**Return**
• ESP_OK success

**Parameters**
• **clk_div**: ADC clock divider, ADC clock is divided from APB clock

```c
esp_err_t adc_set_i2s_data_source(adc_i2s_source_t src)
```
Set I2S data source.

**Return**
• ESP_OK success

**Parameters**
• **src**: I2S DMA data source, I2S DMA can get data from digital signals or from ADC.

```c
esp_err_t adc_i2s_mode_init(adc_unit_t adc_unit, adc_channel_t channel)
```
Initialize I2S ADC mode.

**Return**
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**
• **adc_unit**: ADC unit index
• **channel**: ADC channel index

```c
void adc1_ulp_enable(void)
```
Configure ADC1 to be usable by the ULP.

This function reconfigures ADC1 to be controlled by the ULP. Effect of this function can be reverted using `adc1_get_raw` function.

Note that `adc1_config_channel_atten`, `adc1_config_width` functions need to be called to configure ADC1 channels, before ADC1 is used by the ULP.

```c
int hall_sensor_read(void)
```
Read Hall Sensor.

**Note** When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue.

**Note** The Hall Sensor uses channels 0 and 3 of ADC1. Do not configure these channels for use as ADC channels.
Note The ADC1 module must be enabled by calling adc1_config_width() before calling hall_sensor_read(). ADC1 should be configured for 12 bit readings, as the hall sensor readings are low values and do not cover the full range of the ADC.

Return The hall sensor reading.

```c
esp_err_t adc2_pad_get_io_num(adc2_channel_t channel, gpio_num_t *gpio_num)
```

Get the GPIO number of a specific ADC2 channel.

Return

- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

Parameters

- `channel`: Channel to get the GPIO number
- `gpio_num`: output buffer to hold the GPIO number

```c
esp_err_t adc2_config_channel_atten(adc2_channel_t channel, adc_atten_t atten)
```

Configure the ADC2 channel, including setting attenuation.

The default ADC full-scale voltage is 1.1 V. To read higher voltages (up to the pin maximum voltage, usually 3.3 V) requires setting >0 dB signal attenuation for that ADC channel.

Note This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling `adc2_get_raw()` for this channel.

When VDD_A is 3.3 V:

- 0 dB attenuation (ADC_ATTEN_0db) gives full-scale voltage 1.1 V
- 2.5 dB attenuation (ADC_ATTEN_2_5db) gives full-scale voltage 1.5 V
- 6 dB attenuation (ADC_ATTEN_6db) gives full-scale voltage 2.2 V
- 11 dB attenuation (ADC_ATTEN_11db) gives full-scale voltage 3.9 V (see note below)

Note The full-scale voltage is the voltage corresponding to a maximum reading (depending on ADC2 configured bit width, this value is: 4095 for 12-bits, 2047 for 11-bits, 1023 for 10-bits, 511 for 9 bits.)

Note At 11 dB attenuation the maximum voltage is limited by VDD_A, not the full scale voltage.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `channel`: ADC2 channel to configure
- `atten`: Attenuation level

```c
esp_err_t adc2_get_raw(adc2_channel_t channel, adc_bits_width_t width_bit, int *raw_out)
```

Take an ADC2 reading on a single channel.

Note When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for
any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue.

Note For a given channel, `adc2_config_channel_atten()` must be called before the first time this function is called. If Wi-Fi is started via `esp_wifi_start()`, this function will always fail with ESP_ERR_TIMEOUT.

Return
- ESP_OK if success
- ESP_ERR_TIMEOUT the WIFI is started, using the ADC2

Parameters
- `channel`: ADC2 channel to read
- `width_bit`: Bit capture width for ADC2
- `raw_out`: the variable to hold the output data.

`esp_err_t adc2_vref_to_gpio(gpio_num_t gpio)`
Output ADC2 reference voltage to GPIO 25 or 26 or 27.

This function utilizes the testing mux exclusive to ADC 2 to route the reference voltage one of ADC2’s channels. Supported GPIOs are GPIOs 25, 26, and 27. This reference voltage can be manually read from the pin and used in the esp_adc_cal component.

Return
- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

Parameters
- `gpio`: GPIO number (GPIOs 25, 26 and 27 are supported)

   ADC capture width is 12Bit

ADC_WIDTH_MAX

ADC Calibration

Header File

- esp_adc_cal/include/esp_adc_cal.h

Functions

esp_err_t esp_adc_cal_check_efuse (esp_adc_cal_value_t value_type)
   Checks if ADC calibration values are burned into eFuse.

   This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32

2.3. Peripherals API
Return

- ESP_OK: The calibration mode is supported in eFuse
- ESP_ERR_NOT_SUPPORTED: Error, eFuse values are not burned
- ESP_ERR_INVALID_ARG: Error, invalid argument (ESP_ADC_CAL_DEFAULT_VREF)

Parameters

- `value_type`: Type of calibration value (ESP_ADC_CAL_EFUSE_VREF or ESP_ADC_CAL_EFUSE_TP)

```
 esp_adc_cal_value_t esp_adc_cal_characterize(adc_unit_t adc_num, atten, bit_width, uint32_t default_vref, esp_adc_cal_characteristics_t *chars)
```

Characterize an ADC at a particular attenuation.

This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of \[y = \text{coeff}_a \times x + \text{coeff}_b\]. Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.

**Note** Two Point values and eFuse Vref can be enabled/disabled using menuconfig.

Return

- ESP_ADC_CAL_EFUSE_VREF: eFuse Vref used for characterization
- ESP_ADC_CAL_EFUSE_TP: Two Point value used for characterization (only in Linear Mode)
- ESP_ADC_CAL_DEFAULT_VREF: Default Vref used for characterization

Parameters

- `adc_num`: ADC to characterize (ADC_UNIT_1 or ADC_UNIT_2)
- `atten`: Attenuation to characterize
- `bit_width`: Bit width configuration of ADC
- `default_vref`: Default ADC reference voltage in mV (used if eFuse values is not available)
- `chars`: Pointer to empty structure used to store ADC characteristics

```
uint32_t esp_adc_cal_raw_to_voltage(uint32_t adc_reading, const esp_adc_cal_characteristics_t *chars)
```

Convert an ADC reading to voltage in mV.

This function converts an ADC reading to a voltage in mV based on the ADC’s characteristics.

**Note** Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

Return Voltage in mV

Parameters

- `adc_reading`: ADC reading
- `chars`: Pointer to initialized structure containing ADC characteristics

```
esp_err_t esp_adc_cal_get_voltage(adc_channel_t channel, const esp_adc_cal_characteristics_t *chars, uint32_t *voltage)
```

Reads an ADC and converts the reading to a voltage in mV.
This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

**Note** The Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

**Return**

- ESP_OK: ADC read and converted to mV
- ESP_ERR_TIMEOUT: Error, timed out attempting to read ADC
- ESP_ERR_INVALID_ARG: Error due to invalid arguments

**Parameters**

- `channel`: ADC Channel to read
- `chars`: Pointer to initialized ADC characteristics structure
- `voltage`: Pointer to store converted voltage

**Structures**

```c
struct esp_adc_cal_characteristics_t

Structure storing characteristics of an ADC.

**Note** Call esp_adc_cal_characterize() to initialize the structure
```

**Public Members**

```c
adc_unit_t adc_num
ADC number

adc_atten_t atten
ADC attenuation

adc_bits_width_t bit_width
ADC bit width

uint32_t coeff_a
Gradient of ADC-Voltage curve

uint32_t coeff_b
Offset of ADC-Voltage curve

uint32_t vref
Vref used by lookup table

const uint32_t *low_curve
Pointer to low Vref curve of lookup table (NULL if unused)

const uint32_t *high_curve
Pointer to high Vref curve of lookup table (NULL if unused)
```
Enumerations

enum esp_adc_cal_value_t
Type of calibration value used in characterization.

Values:

ESP_ADC_CAL_VAL_EFUSE_VREF = 0
Characterization based on reference voltage stored in eFuse

ESP_ADC_CAL_VAL_EFUSE_TP = 1
Characterization based on Two Point values stored in eFuse

ESP_ADC_CAL_VAL_DEFAULT_VREF = 2
Characterization based on default reference voltage

2.3.2 Controller Area Network (CAN)

Overview

The ESP32’s peripherals contains a CAN Controller that supports Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID) of the CAN2.0B specification.

Warning: The ESP32 CAN controller is not compatible with CAN FD frames and will interpret such frames as errors.

This programming guide is split into the following sections:

1. Basic CAN Concepts
2. Signals Lines and Transceiver
3. Configuration
4. Driver Operation
5. Examples

Basic CAN Concepts

Note: The following section only covers the basic aspects of CAN. For full details, see the CAN2.0B specification.

The CAN protocol is a multi-master, multi-cast communication protocol with error detection/signalling and inbuilt message prioritization. The CAN protocol is commonly used as a communication bus in automotive applications.
Multi-master: Any node in a CAN bus is allowed initiate the transfer of data.

Multi-cast: When a node transmits a message, all nodes are able to receive the message (broadcast). However some nodes can selective choose which messages to accept via the use of acceptance filtering (multi-cast).

Error Detection and Signalling: Every CAN node will constantly monitor the CAN bus. When any node detects an error, it will signal the error by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

Message Priorities: If two nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID will win arbitration. All other nodes will become receivers ensuring there is at most one transmitter at any time.

**CAN Message Frames**

The CAN2.0B specification contains two frame formats known as Extended Frame and Standard Frame which contain 29-bit IDs and 11-bit IDs respectively. A CAN message consists of the following components:

- 29-bit or 11-bit ID
- Data Length Code (DLC) between 0 to 8
- Up to 8 bytes of data (should match DLC)

**Error States and Counters**

The CAN2.0B specification implements fault confinement by requiring every CAN node to maintain two internal error counters known as the Transmit Error Counter (TEC) and the Receive Error Counter (REC). The two error counters are used to determine a CAN node’s error state, and the counters are incremented and decremented following a set of rules (see CAN2.0B specification). These error states are known as Error Active, Error Passive, and Bus-Off.

Error Active: A CAN node is Error Active when both TEC and REC are less than 128 and indicates a CAN node is operating normally. Error Active nodes are allowed to participate in CAN bus activities, and will actively signal any error conditions it detects by transmitting an Active Error Flag over the CAN bus.

Error Passive: A CAN node is Error Passive when either the TEC or REC becomes greater than or equal to 128. Error Passive nodes are still able to take part in CAN bus activities, but will instead transmit a Passive Error Flag upon detection of an error.

Bus-Off: A CAN node becomes Bus-Off when the TEC becomes greater than or equal to 256. A Bus-Off node is unable take part in CAN bus activity and will remain so until it undergoes bus recovery.

**Signals Lines and Transceiver**

The CAN controller does not contain a internal transceiver and therefore requires an external transceiver to operate. The type of external transceiver will depend on the application’s physical layer specification (e.g. using SN65HVD23X transceivers for ISO 11898-2 compatibility).

The CAN controller’s interface consists of 4 signal lines known as TX, RX, BUS-OFF, and CLKOUT. These four signal lines can be routed through the GPIO Matrix to GPIOs.

TX and RX: The TX and RX signal lines are required to interface with an external CAN transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

BUS-OFF: The BUS-OFF signal line is optional and is set to a low logic level (0V) whenever the CAN controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.
CLKOUT: The CLKOUT signal line is optional and outputs a prescaled version of the CAN controller’s source clock (APB Clock).

Note: An external transceiver must internally tie the TX input and the RX output such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the CAN controller to interpret differences in logic levels between the two signal lines as a lost in arbitration or a bit error.

Configuration

Operating Modes

The CAN driver supports the following modes of operations:

Normal Mode: The normal operating mode allows the CAN controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another CAN node is required when transmitting message frames.

No Ack Mode: The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required when transmitting message frames. This mode is useful when self testing the CAN controller.

Listen Only Mode: This mode will prevent the CAN controller from taking part in bus activities. Therefore transmissions of messages/acknowledgement/error frames will be disabled. However the the CAN controller will still be able to receive messages (without acknowledging). This mode is suited for applications such as CAN bus monitoring.

Alerts

The CAN driver contains an alert feature which is used to notify the application level of certain CAN driver events. Alerts are selectively enabled when the CAN driver is installed, but can be reconfigured during runtime by call-
ing `can_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `can_read_alerts()`. The CAN driver supports the following alerts:

<table>
<thead>
<tr>
<th>Alert</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAN_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>CAN_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>CAN_ALERT_BELOW_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>CAN_ALERT_ERR_ACTIVE</td>
<td>CAN controller has become error active</td>
</tr>
<tr>
<td>CAN_ALERT_RECOVERY_IN_PROGRESS</td>
<td>CAN controller is undergoing bus recovery</td>
</tr>
<tr>
<td>CAN_ALERT_BUS_RECOVERED</td>
<td>CAN controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>CAN_ALERT_ARB_LOST</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>CAN_ALERT_ABOVE_ERR_WARN</td>
<td>One of the error counters have exceeded the error warning limit</td>
</tr>
<tr>
<td>CAN_ALERT_BUS_ERROR</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus</td>
</tr>
<tr>
<td>CAN_ALERT_RX_QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>CAN_ALERT_ERR_PASS</td>
<td>CAN controller has become error passive</td>
</tr>
<tr>
<td>CAN_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. CAN controller can no longer influence bus</td>
</tr>
</tbody>
</table>

**Note:** The error warning limit can be used to preemptively warn the application of bus errors before the error passive state is reached. By default the CAN driver sets the error warning limit to 96. The CAN_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger then or equal to the error warning limit. The CAN_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below 96.

**Note:** When enabling alerts, the CAN_ALERT_AND_LOG flag can be used to cause the CAN driver to log any raised alerts to UART. The CAN_ALERT_ALL and CAN_ALERT_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

**Bit Timing**

The operating bit rate of the CAN controller is configured using the `can_timing_config_t` structure. The period of each bit is made up of multiple time quanta, and the period of a time quanta is determined by a prescaled version of the CAN controller’s source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quanta
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The Baudrate Prescaler is used to determine the period of each time quanta by dividing the CAN controller’s source clock (80 MHz APB clock). The brp can be any even number from 2 to 128. If the ESP32 is a revision 2 or later chip, the brp will also support any multiple of 4 from 132 to 256, and can be enabled by setting the CONFIG_ESP32_REV_MIN to revision 2 or higher.

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determined the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. sjw can range from 1 to 4.
Note: Multiple combinations of brp, tseg_1, tseg_2, and sjw can achieve the same bit rate. Users should tune these values to the physical characteristics of their CAN bus by taking into account factors such as propagation delay, node information processing time, and phase errors.

Bit timing macro initializers are also available for commonly used CAN bus bit rates. The following macro initializers are provided by the CAN driver.

- CAN_TIMING_CONFIG_12_5KBITS()
- CAN_TIMING_CONFIG_16KBITS()
- CAN_TIMING_CONFIG_20KBITS()
- CAN_TIMING_CONFIG_25KBITS()
- CAN_TIMING_CONFIG_50KBITS()
- CAN_TIMING_CONFIG_100KBITS()
- CAN_TIMING_CONFIG_125KBITS()
- CAN_TIMING_CONFIG_250KBITS()
- CAN_TIMING_CONFIG_500KBITS()
- CAN_TIMING_CONFIG_800KBITS()
- CAN_TIMING_CONFIG_1MBITS()

Note: The macro initializers for 12.5K, 16K, and 20K bit rates are only available for ESP32 revision 2 or later.

Acceptance Filter

The CAN controller contains a hardware acceptance filter which can be used to filter CAN messages of a particular ID. A node that filters out a message will not receive the message, but will still acknowledge it. Acceptances filters can make a node more efficient by filtering out messages sent over the CAN bus that are irrelevant to the CAN node in question. The CAN controller’s acceptance filter is configured using two 32-bit values within can_filter_config_t known as the acceptance code and the acceptance mask.

The acceptance code specifies the bit sequence which a message’s ID, RTR, and data bytes must match in order for the message to be received by the CAN controller. The acceptance mask is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under Single or Dual Filter Mode. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the
entirety of an extended frame’s 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended CAN frames respectively).

![Fig. 9: Bit layout of single filter mode (Right side MSBit)](image)

**Dual Filter Mode** will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID’s to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended CAN frames respectively).

![Fig. 10: Bit layout of dual filter mode (Right side MSBit)](image)

**Disabling TX Queue**

The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `can_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the CAN driver.

**Driver Operation**

The CAN driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

<table>
<thead>
<tr>
<th>Label</th>
<th>Transition</th>
<th>Action/Condition</th>
</tr>
</thead>

Driver States

**Uninstalled**: In the uninstalled state, no memory is allocated for the driver and the CAN controller is powered OFF.

**Stopped**: In this state, the CAN controller is powered ON and the CAN driver has been installed. However the CAN controller will be unable to take part in any CAN bus activities such as transmitting, receiving, or acknowledging messages.

**Running**: In the running state, the CAN controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the CAN controller will be able to transmit error frames upon detection of errors on the CAN bus.

**Bus-Off**: The bus-off state is automatically entered when the CAN controller’s Transmit Error Counter becomes greater than or equal to 256 (see CAN2.0B specification regarding error counter rules). The bus-off state indicates the occurrence of severe errors on the CAN bus or in the CAN controller. Whilst in the bus-off state, the CAN controller will be unable to take part in any CAN bus activities. To exit the bus-off state, the CAN controller must undergo the bus recovery process.

**Recovering**: The recovering state is entered when the CAN driver undergoes bus recovery. The CAN driver/controller will remain in the recovering state until the 128 occurrences of the bus-free signal (see CAN2.0B specification) is observed on the CAN bus.

Message Flags

The CAN driver distinguishes different types of CAN messages by using the various bit field members of the `can_message_t` structure. These bit field members help distinguish whether a message is in standard or extended format, an RTR, and the type of transmission to use when transmitting such a message. These bit field members can also be toggled using the the `flags` member of `can_message_t` and the following message flags:

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAN_MSG_FLAG_EXT</td>
<td>Message is in Extended Frame Format (29bit ID)</td>
</tr>
<tr>
<td>CAN_MSG_FLAG_RTR</td>
<td>Message is a Remote Transmit Request</td>
</tr>
<tr>
<td>CAN_MSG_FLAG_SS</td>
<td>Transmit message using Single Shot Transmission (Message will not be retransmitted upon error or loss of arbitration). Unused for received message.</td>
</tr>
<tr>
<td>CAN_MSG_FLAG_SEL</td>
<td>Transmit message using Self Reception Request (Transmitted message will also received by the same node). Unused for received message.</td>
</tr>
<tr>
<td>CAN_MSG_FLAG_DLC</td>
<td>Message is of Data length code is larger than 8. This will break compliance with CAN2.0B</td>
</tr>
<tr>
<td>CAN_MSG_FLAG_NONE</td>
<td>Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.</td>
</tr>
</tbody>
</table>
Examples

Configuration & Installation

The following code snippet demonstrates how to configure, install, and start the CAN driver via the use of the various configuration structures, macro initializers, the `can_driver_install()` function, and the `can_start()` function.

```c
#include "driver/gpio.h"
#include "driver/can.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    can_general_config_t g_config = CAN_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_NUM_22, CAN_MODE_NORMAL);
    can_timing_config_t t_config = CAN_TIMING_CONFIG_500KBITS();
    can_filter_config_t f_config = CAN_FILTER_CONFIG_ACCEPT_ALL();

    //Install CAN driver
    if (can_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start CAN driver
    if (can_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}
```

The usage of macro initializers are not mandatory and each of the configuration structures can be manually.

Message Transmission

The following code snippet demonstrates how to transmit a message via the usage of the `can_message_t` type and `can_transmit()` function.

```c
#include "driver/can.h"

...  

//Configure message to transmit
can_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
```

(continues on next page)
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (can_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}

Message Reception

The following code snippet demonstrates how to receive a message via the usage of the `can_message_t` type and `can_receive()` function.

```c
#include "driver/can.h"
...

//Wait for message to be received
can_message_t message;
if (can_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!(message.rtr)) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}
```

Reconfiguring and Reading Alerts

The following code snippet demonstrates how to reconfigure and read CAN driver alerts via the use of the `can_reconfigure_alerts()` and `can_read_alerts()` functions.

```c
#include "driver/can.h"
...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = CAN_ALERT_ERR_PASS | CAN_ALERT_BUS_OFF;
```
if (can_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
can_read_alerts(&alerts_triggered, portMAX_DELAY);

Stop and Uninstall

The following code demonstrates how to stop and uninstall the CAN driver via the use of the can_stop() and can_driver_uninstall() functions.

```c
#include "driver/can.h"
...

//Stop the CAN driver
if (can_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the CAN driver
if (can_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

Multiple ID Filter Configuration

The acceptance mask in can_filter_config_t can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how the calculate the acceptance mask given multiple IDs:

```
ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101
```
Application Examples

**Network Example:** The CAN Network example demonstrates communication between two ESP32s using the CAN driver API. One CAN node acts as a network master initiate and ceasing the transfer of a data from another CAN node acting as a network slave. The example can be found via peripherals/can/can_network.

**Alert and Recovery Example:** This example demonstrates how to use the CAN driver’s alert and bus recovery API. The example purposely introduces errors on the CAN bus to put the CAN controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via peripherals/can/can_alert_and_recovery.

**Self Test Example:** This example uses the No Acknowledge Mode and Self Reception Request to cause the CAN controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the CAN controller and the external transceiver are working correctly. The example can be found via peripherals/can/can_self_test.

API Reference

**Header File**

- soc/include/hal/can_types.h

**Structures**

**struct can_message_t**

Structure to store a CAN message.

**Note**

*Note* The flags member is deprecated

**Public Members**

```c
uint32_t extd
   Extended Frame Format (29bit ID)

uint32_t rtr
   Message is a Remote Transmit Request

uint32_t ss
   Transmit as a Single Shot Transmission. Unused for received.

uint32_t self
   Transmit as a Self Reception Request. Unused for received.

uint32_t dlc_non_comp
   Message’s Data length code is larger than 8. This will break compliance with CAN2.0B.

uint32_t reserved
   Reserved bits

uint32_t flags
   Alternate way to set message flags using message flag macros (see documentation)

uint32_t identifier
   11 or 29 bit identifier
```
uint8_t data_length_code
    Data length code

uint8_t data[CAN_FRAME_MAX_DLC]
    Data bytes (not relevant in RTR frame)

struct can_timing_config_t
    Structure for bit timing configuration of the CAN driver.

    Note  Macro initializers are available for this structure

Public Members

uint32_t brp
    Baudrate prescaler (i.e., APB clock divider) can be any even number from 2 to 128. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

uint8_t tseg_1
    Timing segment 1 (Number of time quanta, between 1 to 16)

uint8_t tseg_2
    Timing segment 2 (Number of time quanta, 1 to 8)

uint8_t sjw
    Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool triple_sampling
    Enables triple sampling when the CAN controller samples a bit

struct can_filter_config_t
    Structure for acceptance filter configuration of the CAN driver (see documentation)

    Note  Macro initializers are available for this structure

Public Members

uint32_t acceptance_code
    32-bit acceptance code

uint32_t acceptance_mask
    32-bit acceptance mask

bool single_filter
    Use Single Filter Mode (see documentation)

Macros

CAN_EXTD_ID_MASK
    CAN2.0B Constants.
    Bit mask for 29 bit Extended Frame Format ID

CAN_STD_ID_MASK
    Bit mask for 11 bit Standard Frame Format ID

CAN_FRAME_MAX_DLC
    Max data bytes allowed in CAN2.0
**CAN_FRAME_EXTD_ID_LEN_BYTES**

EFF ID requires 4 bytes (29bit)

**CAN_FRAME_STD_ID_LEN_BYTES**

SFF ID requires 2 bytes (11bit)

**CAN_ERR_PASS_THRESH**

Error counter threshold for error passive

### Enumerations

```c
enum can_mode_t
{
    CAN_MODE_NORMAL,
    CAN_MODE_NO_ACK,
    CAN_MODE_LISTEN_ONLY
};
```

**Values:**

- **CAN_MODE_NORMAL**
  
  Normal operating mode where CAN controller can send/receive/acknowledge messages

- **CAN_MODE_NO_ACK**
  
  Transmission does not require acknowledgment. Use this mode for self testing

- **CAN_MODE_LISTEN_ONLY**
  
  The CAN controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

### Header File

- `driver/include/driver/can.h`

### Functions

```c
esp_err_t can_driver_install(const can_general_config_t *g_config,
                              const can_timing_config_t *t_config,
                              const can_filter_config_t *f_config)
```

Install CAN driver.

This function installs the CAN driver using three configuration structures. The required memory is allocated and the CAN driver is placed in the stopped state after running this function.

**Note** Macro initializers are available for the configuration structures (see documentation)

**Note** To reinstall the CAN driver, call `can_driver_uninstall()` first

**Return**

- ESP_OK: Successfully installed CAN driver
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_NO_MEM: Insufficient memory
- ESP_ERR_INVALID_STATE: Driver is already installed

**Parameters**

- `g_config`: General configuration structure
- `t_config`: Timing configuration structure
- `f_config`: Filter configuration structure
esp_err_t can_driver_uninstall (void)
Uninstall the CAN driver.

This function uninstalls the CAN driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**Return**
- ESP_OK: Successfully uninstalled CAN driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

esp_err_t can_start (void)
Start the CAN driver.

This function starts the CAN driver, putting the CAN driver into the running state. This allows the CAN driver to participate in CAN bus activities such as transmitting/receiving messages. The RX queue is reset in this function, clearing any unread messages. This function can only be called when the CAN driver is in the stopped state.

**Return**
- ESP_OK: CAN driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

esp_err_t can_stop (void)
Stop the CAN driver.

This function stops the CAN driver, preventing any further message from being transmitted or received until can_start() is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the CAN driver is in the running state.

**Warning** A message currently being transmitted/received on the CAN bus will be ceased immediately. This may lead to other CAN nodes interpreting the unfinished message as an error.

**Return**
- ESP_OK: CAN driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

esp_err_t can_transmit (const can_message_t *message, TickType_t ticks_to_wait)
Transmit a CAN message.

This function queues a CAN message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it timesout. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the CAN driver is in the running state and cannot be called under Listen Only Mode.

**Note** This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

**Note** The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

**Return**
• ESP_OK: Transmission successfully queued/initiated
• ESP_ERR_INVALID_ARG: Arguments are invalid
• ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
• ESP_FAIL: TX queue is disabled and another message is currently transmitting
• ESP_ERR_INVALID_STATE: CAN driver is not in running state, or is not installed
• ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

Parameters

• message: Message to transmit
• ticks_to_wait: Number of FreeRTOS ticks to block on the TX queue

```c
esp_err_t can_receive(can_message_t *message, TickType_t ticks_to_wait)
```

Receive a CAN message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

**Warning** The flags field of the received message should be checked to determine if the received message contains any data bytes.

**Return**

• ESP_OK: Message successfully received from RX queue
• ESP_ERR_TIMEOUT: Timed out waiting for message
• ESP_ERR_INVALID_ARG: Arguments are invalid
• ESP_ERR_INVALID_STATE: CAN driver is not installed

Parameters

• message: Received message
• ticks_to_wait: Number of FreeRTOS ticks to block on RX queue

```c
esp_err_t can_read_alerts(uint32_t *alerts, TickType_t ticks_to_wait)
```

Read CAN driver alerts.

This function will read the alerts raised by the CAN driver. If no alert has been when this function is called, this function will block until an alert occurs or until it timeouts.

**Note** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

**Return**

• ESP_OK: Alerts read
• ESP_ERR_TIMEOUT: Timed out waiting for alerts
• ESP_ERR_INVALID_ARG: Arguments are invalid
• ESP_ERR_INVALID_STATE: CAN driver is not installed

Parameters

• alerts: Bit field of raised alerts (see documentation for alert flags)
• ticks_to_wait: Number of FreeRTOS ticks to block for alert
esp_err_t can_reconfigure_alerts (uint32_t alerts_enabled, uint32_t *current_alerts)
Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

Return

• ESP_OK: Alerts reconfigured
• ESP_ERR_INVALID_STATE: CAN driver is not installed

Parameters

• alerts_enabled: Bit field of alerts to enable (see documentation for alert flags)
• current_alerts: Bit field of currently raised alerts. Set to NULL if unused

esp_err_t can_initiate_recovery (void)
Start the bus recovery process.

This function initiates the bus recovery process when the CAN driver is in the bus-off state. Once initiated, the CAN driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the CAN bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

Note The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

Return

• ESP_OK: Bus recovery started
• ESP_ERR_INVALID_STATE: CAN driver is not in the bus-off state, or is not installed

esp_err_t can_get_status_info (can_status_info_t *status_info)
Get current status information of the CAN driver.

Return

• ESP_OK: Status information retrieved
• ESP_ERR_INVALID_ARG: Arguments are invalid
• ESP_ERR_INVALID_STATE: CAN driver is not installed

Parameters

• status_info: Status information

esp_err_t can_clear_transmit_queue (void)
Clear the transmit queue.

This function will clear the transmit queue of all messages.

Note The transmit queue is automatically cleared when can_stop() or can_initiate_recovery() is called.

Return

• ESP_OK: Transmit queue cleared
• ESP_ERR_INVALID_STATE: CAN driver is not installed or TX queue is disabled
esp_err_t can_clear_receive_queue (void)
Clear the receive queue.

This function will clear the receive queue of all messages.

**Note** The receive queue is automatically cleared when can_start() is called.

**Return**
- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: CAN driver is not installed

**Structures**

`struct can_general_config_t`
Structure for general configuration of the CAN driver.

**Note** Macro initializers are available for this structure

**Public Members**

- `can_mode_t mode`
  Mode of CAN controller

- `gpio_num_t tx_io`
  Transmit GPIO number

- `gpio_num_t rx_io`
  Receive GPIO number

- `gpio_num_t clkout_io`
  CLKOUT GPIO number (optional, set to -1 if unused)

- `gpio_num_t bus_off_io`
  Bus off indicator GPIO number (optional, set to -1 if unused)

- `uint32_t tx_queue_len`
  Number of messages TX queue can hold (set to 0 to disable TX Queue)

- `uint32_t rx_queue_len`
  Number of messages RX queue can hold

- `uint32_t alerts_enabled`
  Bit field of alerts to enable (see documentation)

- `uint32_t clkout_divider`
  CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

`struct can_status_info_t`
Structure to store status information of CAN driver.

**Public Members**

- `can_state_t state`
  Current state of CAN controller (Stopped/Running/Bus-Off/Recovery)

- `uint32_t msgs_to_tx`
  Number of messages queued for transmission or awaiting transmission completion
uint32_t msgs_to_rx  
Number of messages in RX queue waiting to be read

uint32_t tx_error_counter  
Current value of Transmit Error Counter

uint32_t rx_error_counter  
Current value of Receive Error Counter

uint32_t tx_failed_count  
Number of messages that failed transmissions

uint32_t rx_missed_count  
Number of messages that were lost due to a full RX queue

uint32_t arb_lost_count  
Number of instances arbitration was lost

uint32_t bus_error_count  
Number of instances a bus error has occurred

Macros

CAN_IO_UNUSED  
Marks GPIO as unused in CAN configuration

Enumerations

define can_state_t
  CAN driver states.
  
  Values:
  
  CAN_STATE_STOPPED
  Stopped state. The CAN controller will not participate in any CAN bus activities

  CAN_STATE_RUNNING
  Running state. The CAN controller can transmit and receive messages

  CAN_STATE_BUS_OFF
  Bus-off state. The CAN controller cannot participate in bus activities until it has recovered

  CAN_STATE_RECOVERING
  Recovering state. The CAN controller is undergoing bus recovery

2.3.3 Digital To Analog Converter

Overview

ESP32 has two 8-bit DAC (digital to analog converter) channels, connected to GPIO25 (Channel 1) and GPIO26 (Channel 2).

The DAC driver allows these channels to be set to arbitrary voltages.

The DAC channels can also be driven with DMA-style written sample data, via the I2S driver when using the “built-in DAC mode”.
For other analog output options, see the Sigma-delta Modulation module and the LED Control module. Both these modules produce high frequency PWM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.

**Application Example**

Setting DAC channel 1 (GPIO 25) voltage to approx 0.78 of VDD_A voltage (VDD * 200 / 255). For VDD_A 3.3V, this is 2.59V:

```c
#include <driver/dac.h>
...

dac_output_enable(DAC_CHANNEL_1);
dac_output_voltage(DAC_CHANNEL_1, 200);
```

**API Reference**

**Header File**

- driver/include/driver/dac.h

**Functions**

`esp_err_t dac_pad_get_io_num(dac_channel_t channel, gpio_num_t *gpio_num)`

Get the gpio number of a specific DAC channel.

**Return**

- ESP_OK if success

**Parameters**

- channel: Channel to get the gpio number
- gpio_num: output buffer to hold the gpio number

`esp_err_t dac_output_voltage(dac_channel_t channel, uint8_t dac_value)`

Set DAC output voltage. DAC output is 8-bit. Maximum (255) corresponds to VDD3P3_RTC.

**Note** Need to configure DAC pad before calling this function. DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

**Return**

- ESP_OK success

**Parameters**

- channel: DAC channel
- dac_value: DAC output value

`esp_err_t dac_output_enable(dac_channel_t channel)`

DAC pad output enable.
Note DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26 I2S left channel will be mapped to DAC channel 2 I2S right channel will be mapped to DAC channel 1

Parameters
• channel: DAC channel

`esp_err_t dac_output_disable (dac_channel_t channel)`
DAC pad output disable.

Note DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

Return
• ESP_OK success

Parameters
• channel: DAC channel

`esp_err_t dac_i2s_enable (void)`
Enable DAC output data from I2S.

Return
• ESP_OK success

`esp_err_t dac_i2s_disable (void)`
Disable DAC output data from I2S.

Return
• ESP_OK success

`esp_err_t dac_cw_generator_enable (void)`
Enable cosine wave generator output.

Return
• ESP_OK success

`esp_err_t dac_cw_generator_disable (void)`
Disable cosine wave generator output.

Return
• ESP_OK success

`esp_err_t dac_cw_generator_config (dac_cw_config_t *cw)`
Config the cosine wave generator function in DAC module.

Return
• ESP_OK success

Parameters
• cw: Configuration.
GPIO Lookup Macros

Some useful macros can be used to specified the GPIO number of a DAC channel, or vice versa. e.g.

1. `DAC_CHANNEL_1_GPIO_NUM` is the GPIO number of channel 1 (25);
2. `DAC_GPIO26_CHANNEL` is the channel number of GPIO 26 (channel 2).

Header File

- `soc/esp32/include/soc/dac_channel.h`

Macros

- `DAC_GPIO25_CHANNEL`
- `DAC_CHANNEL_1_GPIO_NUM`
- `DAC_GPIO26_CHANNEL`
- `DAC_CHANNEL_2_GPIO_NUM`

Header File

- `soc/include/hal/dac_types.h`

Structures

`struct dac_cw_config_t`

Config the cosine wave generator function in DAC module.

**Public Members**

- `dac_channel_t en_ch`
  Enable the cosine wave generator of DAC channel.

- `dac_cw_scale_t scale`
  Set the amplitude of the cosine wave generator output.

- `dac_cw_phase_t phase`
  Set the phase of the cosine wave generator output.

- `uint32_t freq`
  Set frequency of cosine wave generator output. Range: 130(130Hz) ~ 55000(100KHz).

- `int8_t offset`
  Set the voltage value of the DC component of the cosine wave generator output. Note: Unreasonable settings can cause waveform to be oversaturated. Range: -128 ~ 127.

2.3. Peripherals API
Enumerations

```c
enum dac_channel_t
{
    DAC_CHANNEL_1 = 0,
    DAC_CHANNEL_2 = 1,
    DAC_CHANNEL_MAX
};
```

Values:

- DAC_CHANNEL_1 is GPIO25(ESP32) / GPIO17(ESP32S2BETA)
- DAC_CHANNEL_2 is GPIO26(ESP32) / GPIO18(ESP32S2BETA)

```c
enum dac_cw_scale_t
{
    DAC_CW_SCALE_1 = 0x0,
    DAC_CW_SCALE_2 = 0x1,
    DAC_CW_SCALE_4 = 0x2,
    DAC_CW_SCALE_8 = 0x3
};
```

Values:

- DAC_CW_SCALE_1 = 0x0, 1/1. Default.
- DAC_CW_SCALE_2 = 0x1, 1/2.
- DAC_CW_SCALE_4 = 0x2, 1/4.
- DAC_CW_SCALE_8 = 0x3, 1/8.

```c
enum dac_cw_phase_t
{
    DAC_CW_PHASE_0 = 0x2,
    DAC_CW_PHASE_180 = 0x3
};
```

Values:

- DAC_CW_PHASE_0 = 0x2, Phase shift +0°
- DAC_CW_PHASE_180 = 0x3, Phase shift +180°

2.3.4 GPIO & RTC GPIO

Overview

The ESP32 chip features 40 physical GPIO pads. Some GPIO pads cannot be used or do not have the corresponding pin on the chip package (refer to technical reference manual). Each pad can be used as a general purpose I/O or can be connected to an internal peripheral signal.

- Note that GPIO6-11 are usually used for SPI flash.
- GPIO34-39 can only be set as input mode and do not have software pullup or pulldown functions.

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when in deep sleep, when the Ultra Low Power co-processor is running, or when analog functions such as ADC/DAC/etc are in use.

Application Example

GPIO output and input interrupt example: peripherals/gpio.
API Reference - Normal GPIO

Header File

- driver/include/driver/gpio.h

Functions

```c
esp_err_t gpio_config(const gpio_config_t *pGPIOConfig)
```

GPIO common configuration.

Configure GPIO's Mode,pull-up, PullDown, IntrType

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- pGPIOConfig: Pointer to GPIO configure struct

```c
esp_err_t gpio_reset_pin(gpio_num_t gpio_num)
```

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

Note This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

Return Always return ESP_OK.

Parameters

- gpio_num: GPIO number.

```c
esp_err_t gpio_set_intr_type(gpio_num_t gpio_num, gpio_int_type_t intr_type)
```

GPIO set interrupt trigger type.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- gpio_num: GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio_num should be GPIO_NUM_16 (16);
- intr_type: Interrupt type, select from gpio_int_type_t

```c
esp_err_t gpio_intr_enable(gpio_num_t gpio_num)
```

Enable GPIO module interrupt signal.

Note Please do not use the interrupt of GPIO36 and GPIO39 when using ADC. Please refer to the comments of adc1_get_raw. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

`esp_err_t gpio_intr_disable(gpio_num_t gpio_num)`

Disable GPIO module interrupt signal.

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number. If you want to disable the interrupt of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

`esp_err_t gpio_set_level(gpio_num_t gpio_num, uint32_t level)`

GPIO set output level.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO number error

Parameters
• gpio_num: GPIO number. If you want to set the output level of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• level: Output level. 0: low ; 1: high

`int gpio_get_level(gpio_num_t gpio_num)`

GPIO get input level.

Warning If the pad is not configured for input (or input and output) the returned value is always 0.

Return
• 0 the GPIO input level is 0
• 1 the GPIO input level is 1

Parameters
• gpio_num: GPIO number. If you want to get the logic level of e.g. pin GPIO16, gpio_num should be GPIO_NUM_16 (16);

`esp_err_t gpio_set_direction(gpio_num_t gpio_num, gpio_mode_t mode)`

GPIO set direction.

Configure GPIO direction, such as output_only, input_only, output_and_input

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO error

Parameters

• gpio_num: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• mode: GPIO direction

`esp_err_t gpio_set_pull_mode (gpio_num_t gpio_num, gpio_pull_mode_t pull)`
Configure GPIO pull-up/pull-down resistors.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG : Parameter error

Parameters

• gpio_num: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• pull: GPIO pull up/down mode.

`esp_err_t gpio_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)`
Enable GPIO wake-up function.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• gpio_num: GPIO number.
• intr_type: GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

`esp_err_t gpio_wakeup_disable (gpio_num_t gpio_num)`
Disable GPIO wake-up function.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• gpio_num: GPIO number

`esp_err_t gpio_isr_register (void (*fin) (void *), void *arg, int intr_alloc_flags, gpio_isr_handle_t *handle)`
Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative gpio_install_isr_service() and gpio_isr_handler_add() API in order to have the driver support per-GPIO ISRs.
To disable or remove the ISR, pass the returned handle to the `interrupt allocation functions`.

**Parameters**

- `fn`: Interrupt handler function.
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- `arg`: Parameter for handler function
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

`esp_err_t gpio_pullup_en(gpio_num_t gpio_num)`
Enable pull-up on GPIO.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number

`esp_err_t gpio_pullup_dis(gpio_num_t gpio_num)`
Disable pull-up on GPIO.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number

`esp_err_t gpio_pulldown_en(gpio_num_t gpio_num)`
Enable pull-down on GPIO.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number

`esp_err_t gpio_pulldown_dis(gpio_num_t gpio_num)`
Disable pull-down on GPIO.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number
**Parameters**

- `gpio_num`: GPIO number

```c
esp_err_t gpio_install_isr_service(int intr_alloc_flags)
```

Install the driver’s GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

**Return**

- ESP_OK Success
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_INVALID_ARG GPIO error

**Parameters**

- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See esp_intr_alloc.h for more info.

```c
void gpio_uninstall_isr_service()
```

Uninstall the driver’s GPIO ISR service, freeing related resources.

```c
esp_err_t gpio_isr_handler_add(gpio_num_t gpio_num, gpio_isr_t isr_handler, void *args)
```

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver’s GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number
- `isr_handler`: ISR handler function for the corresponding GPIO number.
- `args`: parameter for ISR handler.

```c
esp_err_t gpio_isr_handler_remove(gpio_num_t gpio_num)
```

Remove ISR handler for the corresponding GPIO pin.

---

2.3. Peripherals API
Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- gpio_num: GPIO number

\[
\text{esp_err_t gpio_set_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t strength)}
\]
Set GPIO pad drive capability.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- gpio_num: GPIO number, only support output GPIOs
- strength: Drive capability of the pad

\[
\text{esp_err_t gpio_get_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t *strength)}
\]
Get GPIO pad drive capability.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- gpio_num: GPIO number, only support output GPIOs
- strength: Pointer to accept drive capability of the pad

\[
\text{esp_err_t gpio_hold_en(gpio_num_t gpio_num)}
\]
Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, \text{gpio_deep_sleep_hold_en} should also be called.

Power down or call \text{gpio_hold_dis} will disable this function.

Return

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

Parameters

- gpio_num: GPIO number, only support output-capable GPIOs
**esp_err_t gpio_hold_dis(gpio_num_t gpio_num)**

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don’t want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and gpio_hold_dis is called, gpio18 will output low level (because gpio18 is input mode by default). If you don’t want this behavior, you should configure gpio18 as output mode and set it to high level before calling gpio_hold_dis.

**Return**

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

**Parameters**

- gpio_num: GPIO number, only support output-capable GPIOs

**void gpio_deep_sleep_hold_en(void)**

Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call gpio_hold_dis will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

**void gpio_deep_sleep_hold_dis(void)**

Disable all digital gpio pad hold function during Deep-sleep.

**void gpio_iomux_in(uint32_t gpio_num, uint32_t signal_idx)**

Set pad input to a peripheral signal through the IOMUX.

**Parameters**

- gpio_num: GPIO number of the pad.
- signal_idx: Peripheral signal id to input. One of the *_IN_IDX signals in soc/gpio_sig_map.h.

**void gpio_iomux_out(uint8_t gpio_num, int func, bool oen_inv)**

Set peripheral output to an GPIO pad through the IOMUX.

**Parameters**

- gpio_num: gpio_num GPIO number of the pad.
- func: The function number of the peripheral pin to output pin. One of the FUNC_X_* of specified pin (X) in soc/io_mux_reg.h.
- oen_inv: True if the output enable needs to be inverted, otherwise False.

**Type Definitions**

typedef intr_handle_t gpio_isr_handle_t
Header File

- soc/include/hal/gpio_types.h

Structures

struct gpio_config_t
Configuration parameters of GPIO pad for gpio_config function.

  **Public Members**
  
  uint64_t pin_bit_mask
  GPIO pin: set with bit mask, each bit maps to a GPIO

  gpio_mode_t mode
  GPIO mode: set input/output mode

  gpio_pullup_t pull_up_en
  GPIO pull-up

  gpio_pulldown_t pull_down_en
  GPIO pull-down

  gpio_int_type_t intr_type
  GPIO interrupt type

Type Definitions

typedef void (*gpio_isr_t)(void *)

Enumerations

enum gpio_port_t

2.3. Peripherals API
GPIO_DRIVE_CAP_3 = 3
    Pad drive capability: strongest

GPIO_DRIVE_CAP_MAX

API Reference - RTC GPIO

Header File

- driver/include/driver/rtc_io.h

Functions

static bool rtc_gpio_is_valid_gpio (gpio_num_t gpio_num)
    Determine if the specified GPIO is a valid RTC GPIO.

    Return  true if GPIO is valid for RTC GPIO use. false otherwise.

    Parameters
        • gpio_num: GPIO number

static int rtc_io_number_get (gpio_num_t gpio_num)
    Get RTC IO index number by gpio number.

    Return  >=0: Index of rtcio. -1 : The gpio is not rtcio.

    Parameters
        • gpio_num: GPIO number

esp_err_t rtc_gpio_init (gpio_num_t gpio_num)
    Init a GPIO as RTC GPIO.

    This function must be called when initializing a pad for an analog function.

    Return
        • ESP_OK success
        • ESP_ERR_INVALID_ARG GPIO is not an RTC IO

    Parameters
        • gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_deinit (gpio_num_t gpio_num)
    Init a GPIO as digital GPIO.

    Return
        • ESP_OK success
        • ESP_ERR_INVALID_ARG GPIO is not an RTC IO

    Parameters
        • gpio_num: GPIO number (e.g. GPIO_NUM_12)
uint32_t rtc_gpio_get_level(gpio_num_t gpio_num)
Get the RTC IO input level.

Return
- 1 High level
- 0 Low level
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_set_level(gpio_num_t gpio_num, uint32_t level)
Set the RTC IO output level.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)
- level: output level

esp_err_t rtc_gpio_set_direction(gpio_num_t gpio_num, rtc_gpio_mode_t mode)
RTC GPIO set direction.
Configure RTC GPIO direction, such as output only, input only, output and input.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)
- mode: GPIO direction

esp_err_t rtc_gpio_set_direction_in_sleep(gpio_num_t gpio_num, rtc_gpio_mode_t mode)
RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.
NOTE: ESP32 support INPUT_ONLY mode. ESP32S2 support INPUT_ONLY, OUTPUT_ONLY, INPUT_OUTPUT mode.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)
- mode: GPIO direction

2.3. Peripherals API
esp_err_t rtc_gpio_pullup_en(gpio_num_t gpio_num)
RTC GPIO pullup enable.
This function only works for RTC IOs. In general, call gpio_pullup_en, which will work both for normal GPIOs and RTC IOs.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_pulldown_en(gpio_num_t gpio_num)
RTC GPIO pulldown enable.
This function only works for RTC IOs. In general, call gpio_pulldown_en, which will work both for normal GPIOs and RTC IOs.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_pullup_dis(gpio_num_t gpio_num)
RTC GPIO pullup disable.
This function only works for RTC IOs. In general, call gpio_pullup_dis, which will work both for normal GPIOs and RTC IOs.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_pulldown_dis(gpio_num_t gpio_num)
RTC GPIO pulldown disable.
This function only works for RTC IOs. In general, call gpio_pulldown_dis, which will work both for normal GPIOs and RTC IOs.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)
esp_err_t rtc_gpio_hold_en (gpio_num_t gpio_num)
Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_hold_dis (gpio_num_t gpio_num)
Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC_IO peripheral.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_isolate (gpio_num_t gpio_num)
Helper function to disconnect internal circuits from an RTC IO This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call rtc_gpio_isolate(GPIO_NUM_12) before entering deep sleep, to reduce deep sleep current.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12).

esp_err_t rtc_gpio_force_hold_all (void)
Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

esp_err_t rtc_gpio_force_hold_dis_all (void)
Disable force hold signal for all RTC IOs.

esp_err_t rtc_gpio_set_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t strength)
Set RTC GPIO pad drive capability.

2.3. Peripherals API
Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- gpio_num: GPIO number, only support output GPIOs
- strength: Drive capability of the pad

`esp_err_t rtc_gpio_get_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t *strength)`

Get RTC GPIO pad drive capability.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- gpio_num: GPIO number, only support output GPIOs
- strength: Pointer to accept drive capability of the pad

`esp_err_t rtc_gpio_wakeup_enable(gpio_num_t gpio_num, gpio_int_type_t intr_type)`

Enable wakeup from sleep mode using specific GPIO.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO, or intr_type is not one of GPIO_INTR_HIGH_LEVEL, GPIO_INTR_LOW_LEVEL.

Parameters

- gpio_num: GPIO number
- intr_type: Wakeup on high level (GPIO_INTR_HIGH_LEVEL) or low level (GPIO_INTR_LOW_LEVEL)

`esp_err_t rtc_gpio_wakeup_disable(gpio_num_t gpio_num)`

Disable wakeup from sleep mode using specific GPIO.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO

Parameters

- gpio_num: GPIO number

Macros

`RTC_GPIO_IS_VALID_GPIO(gpio_num)`
Header File

- `soc/include/hal/rtc_io_types.h`

Enumerations

```c
enum rtc_gpio_mode_t
    RTCIO output/input mode type.

    Values:
    RTC_GPIO_MODE_INPUT_ONLY
        Pad input
    RTC_GPIO_MODE_OUTPUT_ONLY
        Pad output
    RTC_GPIO_MODE_INPUT_OUTPUT
        Pad input + output
    RTC_GPIO_MODE_DISABLED
        Pad (output + input) disable
    RTC_GPIO_MODE_OUTPUT_OD
        Pad open-drain output
    RTC_GPIO_MODE_INPUT_OUTPUT_OD
        Pad input + open-drain output
```

2.3.5 I2C Driver

Overview

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32 has two I2C controllers (also referred to as ports) which are responsible for handling communications on two I2C buses. Each I2C controller can operate as master or slave. As an example, one controller can act as a master and the other as a slave at the same time.

Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Slave mode
- Reading and writing to registers which are in turn read/written by the master
Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. **Configuration** - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. **Install Driver** - activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item
   a) **Communication as Master** - handle communications (master)
   b) **Communication as Slave** - respond to messages from the master (slave)
4. **Interrupt Handling** - configure and service I2C interrupts
5. **Customized Configuration** - adjust default I2C communication parameters (timings, bit order, etc.)
6. **Error Handling** - how to recognize and handle driver configuration and communication errors
7. **Delete Driver** - release resources used by the I2C driver when communication ends

Configuration

To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C **mode of operation** - slave or master from `i2c_mode_t`
- Configure **communication pins**
  - Assign GPIO pins for SDA and SCL signals
  - Set whether to enable ESP32's internal pull-ups
- (Master only) Set I2C **clock speed**
- (Slave only) Configure the following
  - Whether to enable **10 bit address mode**
  - Define **slave address**

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see **Customized Configuration**.

Install Driver

After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- Master or slave, selected from `i2c_mode_t`
• (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master’s request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master’s own discretion.

• Flags for allocating the interrupt (see ESP_INTR_FLAG_* values in esp32/include/esp_intr_alloc.h)

**Communication as Master**

After installing the I2C driver, ESP32 is ready to communicate with other I2C devices.

ESP32’s I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a “command link”, that should be populated with a sequence of commands and then passed to the I2C controller for execution.

**Master Write**

The example below shows how to build a command link for an I2C master to send \( n \) bytes to a slave.

![Fig. 12: I2C command link - master write example](image)

The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`.

Then, populate it with the series of data to be sent to the slave:

a) **Start bit** - `i2c_master_start()`

b) **Slave address** - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.

c) **Data** - One or more bytes as an argument of `i2c_master_write()`
d) **Stop bit - `i2c_master_stop()`**

Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.

2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.

3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

### Master Read

The example below shows how to build a command link for an I2C master to read \( n \) bytes from a slave.

![Fig. 13: I2C command link - master read example](image)

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` functions but with `i2c_master_read_byte()` and/or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

#### Indicating Write or Read

After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave. The information on what the master will actually do is hidden in the least significant bit of the slave’s address.

For this reason, the command link sent by the master to write data to the slave contains the address `(ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE` and looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```
Communication as Slave

After installing the I2C driver, ESP32 is ready to communicate with other I2C devices.

The API provides the following functions for slaves:

- **i2c_slave_read_buffer()**
  Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.

- **i2c_slave_write_buffer()**
  The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in `peripherals/i2c`.

Interrupt Handling

During driver installation, an interrupt handler is installed by default. However, you can register your own interrupt handler instead of the default one by calling the function `i2c_isr_register()`. When implementing your own interrupt handler, refer to the ESP32 Technical Reference Manual for the description of interrupts triggered by the I2C controller.

To delete an interrupt handler, call `i2c_isr_free()`.

Customized Configuration

As mentioned at the end of Section Configuration, when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the I2C specification. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`.

<table>
<thead>
<tr>
<th>Parameters to Change</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>High time and low time for SCL pulses</td>
<td><code>i2c_set_period()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of start signals</td>
<td><code>i2c_set_start_timing()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of stop signals</td>
<td><code>i2c_set_stop_timing()</code></td>
</tr>
<tr>
<td>Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles</td>
<td><code>i2c_set_data_timing()</code></td>
</tr>
<tr>
<td>I2C timeout</td>
<td><code>i2c_set_timeout()</code></td>
</tr>
<tr>
<td>Choice between transmitting/receiving the LSB or MSB first, choose one of the modes defined in <code>i2c_trans_mode_t</code></td>
<td><code>i2c_set_data_mode()</code></td>
</tr>
</tbody>
</table>
Each of the above functions has a _get_ counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file `driver/i2c.c` and look for defines with the suffix `_DEFAULT`.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.

**Note:** ESP32’s internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the I2C specification.

### Error Handling

The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file `driver/i2c.c` and look for defines with the suffix `_ERR_STR`.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see **Interrupt Handling**.

In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.

### Delete Driver

When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.

### Application Example

I2C master and slave example: `peripherals/i2c`.

### API Reference

#### Header File

- `driver/include/driver/i2c.h`

#### Functions

```c
esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)
```

I2C driver install.

**Note** Only slave mode will use this value, driver will ignore this value in master mode.
Note Only slave mode will use this value, driver will ignore this value in master mode.

Note In master mode, if the cache is likely to be disabled(such as write flash) and the slave is time-sensitive, ESP_INTR_FLAG_IRAM is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram(if psram is enabled) in interrupt handle function when cache is disabled.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver install error

Parameters
- i2c_num: I2C port number
- mode: I2C mode (master or slave)
- slv_rx_buf_len: receiving buffer size for slave mode

Parameters
- slv_tx_buf_len: sending buffer size for slave mode

Parameters
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

```c
esp_err_t i2c_driver_delete(i2c_port_t i2c_num)
```
I2C driver delete.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number

```c
esp_err_t i2c_param_config(i2c_port_t i2c_num, const i2c_config_t *i2c_conf)
```
I2C parameter initialization.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- i2c_conf: pointer to I2C parameter settings

```c
esp_err_t i2c_reset_tx_fifo(i2c_port_t i2c_num)
```
reset I2C tx hardware fifo

Return
**i2c_reset_rx_fifo**

```c
esp_err_t i2c_reset_rx_fifo(i2c_port_t i2c_num)
```

Reset I2C rx fifo.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port number

**i2c_isr_register**

```c
esp_err_t i2c_isr_register(i2c_port_t i2c_num, void (*fn)(void *arg, int intr_alloc_flags, intr_handle_t *handle), void *arg, int intr_alloc_flags, intr_handle_t *handle)
```

Register I2C isr handler.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `fn`: isr handler function
- `arg`: parameter for isr handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- `handle`: handle return from esp_intr_alloc.

**i2c_isr_free**

```c
esp_err_t i2c_isr_free(intr_handle_t handle)
```

Delete and free I2C isr.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `handle`: handle of isr.

**i2c_set_pin**

```c
esp_err_t i2c_set_pin(i2c_port_t i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, i2c_mode_t mode)
```

Configure GPIO signal for I2C sck and sda.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `handle`: handle of is.
Parameters

- \texttt{i2c\_num}: I2C port number
- \texttt{sda\_io\_num}: GPIO number for I2C sda signal
- \texttt{scl\_io\_num}: GPIO number for I2C scl signal
- \texttt{sda\_pullup\_en}: Whether to enable the internal pullup for sda pin
- \texttt{scl\_pullup\_en}: Whether to enable the internal pullup for scl pin
- \texttt{mode}: I2C mode

\texttt{i2c\_cmd\_handle\_t i2c\_cmd\_link\_create}(void)
Create and init I2C command link.

\textbf{Note} Before we build I2C command link, we need to call \texttt{i2c\_cmd\_link\_create()} to create a command link. After we finish sending the commands, we need to call \texttt{i2c\_cmd\_link\_delete()} to release and return the resources.

\textbf{Return} i2c command link handler

\texttt{void i2c\_cmd\_link\_delete}(i2c\_cmd\_handle\_t cmd\_handle)
Free I2C command link.

\textbf{Note} Before we build I2C command link, we need to call \texttt{i2c\_cmd\_link\_create()} to create a command link. After we finish sending the commands, we need to call \texttt{i2c\_cmd\_link\_delete()} to release and return the resources.

\textbf{Parameters}

- \texttt{cmd\_handle}: I2C command handle

\texttt{esp\_err\_t i2c\_master\_start}(i2c\_cmd\_handle\_t cmd\_handle)
Queue command for I2C master to generate a start signal.

\textbf{Note} Only call this function in I2C master mode Call \texttt{i2c\_master\_cmd\_begin()} to send all queued commands

\textbf{Return}

- \texttt{ESP\_OK} Success
- \texttt{ESP\_ERR\_INVALID\_ARG} Parameter error

\textbf{Parameters}

- \texttt{cmd\_handle}: I2C cmd link

\texttt{esp\_err\_t i2c\_master\_write\_byte}(i2c\_cmd\_handle\_t cmd\_handle, uint8\_t data, bool ack\_en)
Queue command for I2C master to write one byte to I2C bus.

\textbf{Note} Only call this function in I2C master mode Call \texttt{i2c\_master\_cmd\_begin()} to send all queued commands

\textbf{Return}

- \texttt{ESP\_OK} Success
- \texttt{ESP\_ERR\_INVALID\_ARG} Parameter error

\textbf{Parameters}

- \texttt{cmd\_handle}: I2C cmd link
- **data**: I2C one byte command to write to bus
- **ack_en**: enable ack check for master

```c
esp_err_t i2c_master_write(i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, bool ack_en)
```

Queue command for I2C master to write buffer to I2C bus.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Note** If the psram is enabled and intr_flag is `ESP_INTR_FLAG_IRAM`, please use the memory allocated from internal RAM.

**Return**
- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Parameter error

**Parameters**
- **cmd_handle**: I2C cmd link
- **data**: data to send

**Parameters**
- **data_len**: data length
- **ack_en**: enable ack check for master

```c
esp_err_t i2c_master_read_byte(i2c_cmd_handle_t cmd_handle, uint8_t *data, i2c_ack_type_t ack)
```

Queue command for I2C master to read one byte from I2C bus.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Note** If the psram is enabled and intr_flag is `ESP_INTR_FLAG_IRAM`, please use the memory allocated from internal RAM.

**Return**
- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Parameter error

**Parameters**
- **cmd_handle**: I2C cmd link
- **data**: pointer accept the data byte

**Parameters**
- **ack**: ack value for read command

```c
esp_err_t i2c_master_read(i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, i2c_ack_type_t ack)
```

Queue command for I2C master to read data from I2C bus.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Note** If the psram is enabled and intr_flag is `ESP_INTR_FLAG_IRAM`, please use the memory allocated from internal RAM.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**

• **cmd_handle**: I2C cmd link
• **data**: data buffer to accept the data from bus

**Parameters**

• **data_len**: read data length
• **ack**: ack value for read command

```c
esp_err_t i2c_master_stop(i2c_cmd_handle_t cmd_handle)
```
Queue command for I2C master to generate a stop signal.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**

• **cmd_handle**: I2C cmd link

```c
esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)
```
I2C master send queued commands. This function will trigger sending all queued commands. The task will be blocked until all the commands have been sent out. The I2C APIs are not thread-safe, if you want to use one I2C port in different tasks, you need to take care of the multi-thread issue.

**Note** Only call this function in I2C master mode

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL Sending command error, slave doesn’t ACK the transfer.
• ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
• ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

**Parameters**

• **i2c_num**: I2C port number
• **cmd_handle**: I2C command handler
• **ticks_to_wait**: maximum wait ticks.

```c
int i2c_slave_write_buffer(i2c_port_t i2c_num, uint8_t *data, int size, TickType_t ticks_to_wait)
```
I2C slave write data to internal ringbuffer, when tx fifo empty, isr will fill the hardware fifo from the internal ringbuffer.

**Note** Only call this function in I2C slave mode

**Return**
• ESP_FAIL(-1) Parameter error
• Others(>=0) The number of data bytes that pushed to the I2C slave buffer.

Parameters
• i2c_num: I2C port number
• data: data pointer to write into internal buffer
• size: data size
• ticks_to_wait: Maximum waiting ticks

int i2c_slave_read_buffer(i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)

I2C slave read data from internal buffer. When I2C slave receive data, isr will copy received data from hardware rx fifo to internal ringbuffer. Then users can read from internal ringbuffer.

Note Only call this function in I2C slave mode

Return
• ESP_FAIL(-1) Parameter error
• Others(>=0) The number of data bytes that read from I2C slave buffer.

Parameters
• i2c_num: I2C port number
• data: data pointer to accept data from internal buffer
• max_size: Maximum data size to read
• ticks_to_wait: Maximum waiting ticks

esp_err_t i2c_set_period(i2c_port_t i2c_num, int high_period, int low_period)

set I2C master clock period

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• high_period: clock cycle number during SCL is high level, high_period is a 14 bit value
• low_period: clock cycle number during SCL is low level, low_period is a 14 bit value

esp_err_t i2c_get_period(i2c_port_t i2c_num, int *high_period, int *low_period)

get I2C master clock period

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• high_period: pointer to get clock cycle number during SCL is high level, will get a 14 bit value
• low_period: pointer to get clock cycle number during SCL is low level, will get a 14 bit value

```c
esp_err_t i2c_filter_enable(i2c_port_t i2c_num, uint8_t cyc_num)
```

enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise(about 20ns), or
the rising edge of the SCL clock is very slow, these may cause the master state machine broken. enable hardware
filter can filter out high frequency interference and make the master more stable.

**Note** Enable filter will slow the SCL clock.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- i2c_num: I2C port number
- cyc_num: the APB cycles need to be filtered(0<= cyc_num <=7). When the period of a pulse is less
  than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

```c
esp_err_t i2c_filter_disable(i2c_port_t i2c_num)
```

disable filter on I2C bus

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- i2c_num: I2C port number

```c
esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)
```

set I2C master start signal timing

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- i2c_num: I2C port number
  - setup_time: clock number between the falling-edge of SDA and rising-edge of SCL for start mark,
    it's a 10-bit value.
  - hold_time: clock num between the falling-edge of SDA and falling-edge of SCL for start mark,
    it's a 10-bit value.

```c
esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)
```

get I2C master start signal timing

**Return**

- ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• setup_time: pointer to get setup time
• hold_time: pointer to get hold time

```c
esp_err_t i2c_set_stop_timing(i2c_port_t i2c_num, int setup_time, int hold_time)
```
set I2C master stop signal timing

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• setup_time: clock num between the rising-edge of SCL and the rising-edge of SDA, it’s a 10-bit value.
• hold_time: clock number after the STOP bit’s rising-edge, it’s a 14-bit value.

```c
esp_err_t i2c_get_stop_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)
```
get I2C master stop signal timing

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• setup_time: pointer to get setup time.
• hold_time: pointer to get hold time.

```c
esp_err_t i2c_set_data_timing(i2c_port_t i2c_num, int sample_time, int hold_time)
```
set I2C data signal timing

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• sample_time: clock number I2C used to sample data on SDA after the rising-edge of SCL, it’s a 10-bit value.
• hold_time: clock number I2C used to hold the data after the falling-edge of SCL, it’s a 10-bit value.

```c
esp_err_t i2c_get_data_timing(i2c_port_t i2c_num, int *sample_time, int *hold_time)
```
get I2C data signal timing
Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• i2c_num: I2C port number
• sample_time: pointer to get sample time
• hold_time: pointer to get hold time

```c
esp_err_t i2c_set_timeout (i2c_port_t i2c_num, int timeout)
```
set I2C timeout value

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• i2c_num: I2C port number
• timeout: timeout value for I2C bus (unit: APB 80Mhz clock cycle)

```c
esp_err_t i2c_get_timeout (i2c_port_t i2c_num, int *timeout)
```
get I2C timeout value

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• i2c_num: I2C port number
• timeout: pointer to get timeout value

```c
esp_err_t i2c_set_data_mode (i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode)
```
set I2C data transfer mode

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• i2c_num: I2C port number
• tx_trans_mode: I2C sending data mode
• rx_trans_mode: I2C receiving data mode

```c
esp_err_t i2c_get_data_mode (i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode, i2c_trans_mode_t *rx_trans_mode)
```
get I2C data transfer mode

2.3. Peripherals API
Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- i2c_num: I2C port number
- tx_trans_mode: pointer to get I2C sending data mode
- rx_trans_mode: pointer to get I2C receiving data mode

Macros

I2C_APB_CLK_FREQ
I2C source clock is APB clock, 80MHz

I2C_NUM_0
I2C port 0

I2C_NUM_1
I2C port 1

I2C_NUM_MAX
I2C port max

Type Definitions

typedef void *i2c_cmd_handle_t
I2C command handle

Header File

- soc/include/hal/i2c_types.h

Structures

struct i2c_config_t
I2C initialization parameters.

Public Members

i2c_mode_t mode
I2C mode

int sda_io_num
GPIO number for I2C sda signal

int scl_io_num
GPIO number for I2C scl signal

bool sda_pullup_en
Internal GPIO pull mode for I2C sda signal
**bool scl_pullup_en**  
Internal GPIO pull mode for I2C scl signal

**uint32_t clk_speed**  
I2C clock frequency for master mode, (no higher than 1MHz for now)

**uint8_t addr_10bit_en**  
I2C 10bit address mode enable for slave mode

**uint16_t slave_addr**  
I2C address for slave mode

**Type Definitions**

```c
typedef int i2c_port_t
```
I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).

**Enumerations**

```c
enum i2c_mode_t
{
    I2C_MODE_SLAVE = 0,
    I2C_MODE_MASTER,
    I2C_MODE_MAX
};
```

Values:

- **I2C_MODE_SLAVE** = 0  
  I2C slave mode

- **I2C_MODE_MASTER**  
  I2C master mode

- **I2C_MODE_MAX**

```c
eenum i2c_rw_t
{
    I2C_MASTER_WRITE = 0,
    I2C_MASTER_READ
};
```

Values:

- **I2C_MASTER_WRITE** = 0  
  I2C write data

- **I2C_MASTER_READ**  
  I2C read data

```c
eenum i2c_opmode_t
{
    I2C_CMD_RESTART = 0,
    I2C_CMD_WRITE,
    I2C_CMD_READ,
    I2C_CMD_STOP,
    I2C_CMD_END
};
```

Values:

- **I2C_CMD_RESTART** = 0  
  I2C restart command

- **I2C_CMD_WRITE**  
  I2C write command

- **I2C_CMD_READ**  
  I2C read command

- **I2C_CMD_STOP**  
  I2C stop command

- **I2C_CMD_END**  
  I2C end command

```c
eenum i2c_trans_mode_t
{
};
```

Values:
I2C_DATA_MODE_MSB_FIRST = 0
    I2C data msb first

I2C_DATA_MODE_LSB_FIRST = 1
    I2C data lsb first

I2C_DATA_MODE_MAX

enum i2c_addr_mode_t
    Values:
    I2C_ADDR_BIT_7 = 0
        I2C 7bit address for slave mode

    I2C_ADDR_BIT_10
        I2C 10bit address for slave mode

    I2C_ADDR_BIT_MAX

enum i2c_ack_type_t
    Values:
    I2C_MASTER_ACK = 0x0
        I2C ack for each byte read

    I2C_MASTER_NACK = 0x1
        I2C nack for each byte read

    I2C_MASTER_LAST_NACK = 0x2
        I2C nack for the last byte

    I2C_MASTER_ACK_MAX

enum i2c_sclk_t
    Values:
    I2C_SCLK_REF_TICK
        I2C source clock from REF_TICK

    I2C_SCLK_APB
        I2C source clock from APB

2.3.6 I2S

Overview

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32 integrates two I2S controllers, referred to as I2S0 and I2S1, both of which can be used for streaming audio and video digital data.

An I2S bus consists of the following lines:
    • Bit clock line
    • Channel select line
    • Serial data line

Each I2S controller has the following features that can be configured using the I2S driver:
    • Operation as system master or slave
• Capable of acting as transmitter or receiver
• Dedicated DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in half-duplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

I2S0 output can be routed directly to the digital-to-analog converter’s (DAC) output channels (GPIO 25 & GPIO 26) to produce direct analog output without involving any external I2S codecs. I2S0 can also be used for transmitting PDM (Pulse-density modulation) signals.

The I2S peripherals also support LCD mode for communicating data over a parallel bus, as used by some LCD displays and camera modules. LCD mode has the following operational modes:

• LCD master transmitting mode
• Camera slave receiving mode
• ADC/DAC mode

For more information, see the ESP32 Technical Reference Manual.

Note: For high accuracy clock applications, use the APLL_CLK clock source, which has the frequency range of 16 ~ 128 MHz. You can enable the APLL_CLK clock source by setting `i2s_config_t::use_apll` to TRUE.

If `i2s_config_t::use_apll` = TRUE and `i2s_config_t::fixed_mclk` > 0, then the master clock output frequency for I2S will be equal to the value of `i2s_config_t::fixed_mclk`, which means that the mclk frequency is provided by the user, instead of being calculated by the driver.

The clock rate of the word select line, which is called audio left-right clock rate (LRCK) here, is always the divisor of the master clock output frequency and for which the following is always true: 0 < MCLK/LRCK/channels/bits_per_sample < 64.

### Functional Overview

### Installing the Driver

Install the I2S driver by calling the function `i2s_driver_install` and passing the following arguments:

• Port number
• The structure `i2s_config_t` with defined communication parameters
• Event queue size and handle

Configuration example:

```
static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
  .mode = I2S_MODE_MASTER | I2S_MODE_TX,
  .sample_rate = 44100,
  .bits_per_sample = 16,
  .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
  .communication_format = I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_MSB,
  .intr_alloc_flags = 0, // default interrupt priority
  .dma_buf_count = 8,
  .dma_buf_len = 64,
};
```

(continues on next page)
Setting Communication Pins

Once the driver is installed, configure physical GPIO pins to which signals will be routed. For this, call the function:

```c
i2s_set_pin
```
and pass the following arguments to it:

- Port number
- The structure `i2s_pin_config_t` defining the GPIO pin numbers to which the driver should route the BCK, WS, DATA out, and DATA in signals. If you want to keep a currently allocated pin number for a specific signal, or if this signal is unused, then pass the macro `I2S_PIN_NO_CHANGE`. See the example below.

```c
static const i2s_pin_config_t pin_config = {
    .bck_io_num = 26,
    .ws_io_num = 25,
    .data_out_num = 22,
    .data_in_num = I2S_PIN_NO_CHANGE
};
```

```
i2s_set_pin(i2s_num, &pin_config);
```

Running I2S Communication

To perform a transmission:

- Prepare the data for sending
- Call the function `i2s_write()` and pass the data buffer address and data length to it

The function will write the data to the I2S DMA Tx buffer, and then the data will be transmitted automatically.

```c
i2s_write(I2S_NUM, samples_data, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_write, 100);
```

To retrieve received data, use the function `i2s_read()`. It will retrieve the data from the I2S DMA Rx buffer, once the data is received by the I2S controller.

You can temporarily stop the I2S driver by calling the function `i2s_stop()`, which will disable the I2S Tx/Rx units until the function `i2s_start()` is called. If the function `i2s_driver_install` is used, the driver will start up automatically eliminating the need to call `i2s_start()`.

Deleting the Driver

If the established communication is no longer required, the driver can be removed to free allocated resources by calling `i2s_driver_uninstall()`.
Application Example

A code example for the I2S driver can be found in the directory peripherals/i2s. In addition, there are two short configuration examples for the I2S driver.

I2S configuration

```c
#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = 16,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_MSB,
    .intr_alloc_flags = 0, // default interrupt priority
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 26,
    .ws_io_num = 25,
    .data_out_num = 22,
    .data_in_num = I2S_PIN_NO_CHANGE
};
...

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s
i2s_set_pin(i2s_num, &pin_config);
i2s_set_sample_rates(i2s_num, 22050); //set sample rates
i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver
```

Configuring I2S to use internal DAC for analog output

```c
#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX | I2S_MODE_DAC_BUILT_IN,
    .sample_rate = 44100,
    .bits_per_sample = 16, // the DAC module will only take the 8bits from MSB
    ...  
}(continues on next page)
```
.. channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
.. communication_format = I2S_COMM_FORMAT_I2S_MSB,
.. intr_alloc_flags = 0, // default interrupt priority
.. dma_buf_count = 8,
.. dma_buf_len = 64,
.. use_apll = false
};
...

i2s_driver_install(i2s_num, &i2s_config, 0, NULL);  //install and start i2s_driver

i2s_set_pin(i2s_num, NULL);  //for internal DAC, this will enable both of the internal channels

//You can call i2s_set_dac_mode to set built-in DAC output mode.
//i2s_set_dac_mode(I2S_DAC_CHANNEL_BOTH_EN);

i2s_set_sample_rates(i2s_num, 22050);  //set sample rates

i2s_driver_uninstall(i2s_num);  //stop & destroy i2s driver

### API Reference

#### Header File

- driver/include/driver/i2s.h

#### Functions

**esp_err_t i2s_set_pin (i2s_port_t i2s_num, const i2s_pin_config_t *pin)**

Set I2S pin number.

Inside the pin configuration structure, set I2S_PIN_NO_CHANGE for any pin where the current configuration should not be changed.

**Note** The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral input signal can only be connected to one GPIO pad.

**Parameters**

- **i2s_num**: I2S_NUM_0 or I2S_NUM_1
- **pin**: I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 & GPIO26)

**Note** if *pin* is set as NULL, this function will initialize both of the built-in DAC channels by default. if you don’t want this to happen and you want to initialize only one of the DAC channels, you can call i2s_set_dac_mode instead.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL IO error

```c
esp_err_t i2s_set_dac_mode(i2s_dac_mode_t dac_mode)
```
Set I2S dac mode, I2S built-in DAC is disabled by default.

**Note** Built-in DAC functions are only supported on I2S0 for current ESP32 chip. If either of the built-in DAC channel are enabled, the other one can not be used as RTC DAC function at the same time.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `dac_mode`: DAC mode configurations - see i2s_dac_mode_t

```c
esp_err_t i2s_driver_install(i2s_port_t i2s_num, const i2s_config_t *i2s_config, int queue_size, void *i2s_queue)
```
Install and start I2S driver.

This function must be called before any I2S driver read/write operations.

**Parameters**
- `i2s_num`: I2S_NUM_0, I2S_NUM_1
- `i2s_config`: I2S configurations - see i2s_config_t struct
- `queue_size`: I2S event queue size/depth.
- `i2s_queue`: I2S event queue handle, if set NULL, driver will not use an event queue.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

```c
esp_err_t i2s_driver_uninstall(i2s_port_t i2s_num)
```
Uninstall I2S driver.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2s_num`: I2S_NUM_0, I2S_NUM_1

```c
esp_err_t i2s_write(i2s_port_t i2s_num, const void *src, size_t size, size_t *bytes_written, TickType_t ticks_to_wait)
```
Write data to I2S DMA transmit buffer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Parameters

- \textit{i2s\_num}: I2S\_NUM\_0, I2S\_NUM\_1
- \textit{src}: Source address to write from
- \textit{size}: Size of data in bytes
- \textit{bytes\_written}: Number of bytes written, if timeout, the result will be less than the size passed in.
- \textit{ticks\_to\_wait}: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass \texttt{portMAX\_DELAY} for no timeout.

\begin{verbatim}
esp_err_t i2s_write_expand(i2s_port_t i2s_num, const void *src, size_t size, size_t src_bits, size_t aim_bits, size_t *bytes_written, TickType_t ticks_to_wait)
\end{verbatim}

Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM. Format of the data in source buffer is determined by the I2S configuration (see \texttt{i2s\_config\_t}).

Parameters

- \textit{i2s\_num}: I2S\_NUM\_0, I2S\_NUM\_1
- \textit{src}: Source address to write from
- \textit{size}: Size of data in bytes
- \textit{src\_bits}: Source audio bit
- \textit{aim\_bits}: Bit wanted, no more than 32, and must be greater than \textit{src\_bits}
- \textit{bytes\_written}: Number of bytes written, if timeout, the result will be less than the size passed in.
- \textit{ticks\_to\_wait}: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass \texttt{portMAX\_DELAY} for no timeout.

Return

- \texttt{ESP\_OK} Success
- \texttt{ESP\_ERR\_INVALID\_ARG} Parameter error

\begin{verbatim}
esp_err_t i2s_read(i2s_port_t i2s_num, void *dest, size_t size, size_t *bytes_read, TickType_t ticks_to_wait)
\end{verbatim}

Read data from I2S DMA receive buffer.

\textbf{Note} If the built-in ADC mode is enabled, we should call \texttt{i2s\_adc\_start} and \texttt{i2s\_adc\_stop} around the whole reading process, to prevent the data getting corrupted.

Return

- \texttt{ESP\_OK} Success
- \texttt{ESP\_ERR\_INVALID\_ARG} Parameter error

Parameters

- \textit{i2s\_num}: I2S\_NUM\_0, I2S\_NUM\_1
• dest: Destination address to read into
• size: Size of data in bytes
• bytes_read: Number of bytes read, if timeout, bytes read will be less than the size passed in.
• ticks_to_wait: RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

\[ \text{esp\_err\_t } \text{i2s\_set\_sample\_rates}(\text{i2s\_port\_t } \text{i2s\_num}, \text{uint32\_t } \text{rate}) \]

Set sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and \text{i2s\_config\_t} configuration parameters (number of channels, bits_per_sample).

\[
\text{bit\_clock} = \text{rate} \times (\text{number of channels}) \times \text{bits\_per\_sample}
\]

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM Out of memory

Parameters
• \text{i2s\_num}: I2S_NUM_0, I2S_NUM_1
• \text{rate}: I2S sample rate (ex: 8000, 44100...)

\[ \text{esp\_err\_t } \text{i2s\_stop}(\text{i2s\_port\_t } \text{i2s\_num}) \]

Stop I2S driver.

There is no need to call i2s_stop() before calling i2s_driver_uninstall().

Disables I2S TX/RX, until i2s_start() is called.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• \text{i2s\_num}: I2S_NUM_0, I2S_NUM_1

\[ \text{esp\_err\_t } \text{i2s\_start}(\text{i2s\_port\_t } \text{i2s\_num}) \]

Start I2S driver.

It is not necessary to call this function after i2s_driver_install() (it is started automatically), however it is necessary to call it after i2s_stop().

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• \text{i2s\_num}: I2S_NUM_0, I2S_NUM_1
esp_err_t i2s_zero_dma_buffer (i2s_port_t i2s_num)
Zero the contents of the TX DMA buffer.
Pushes zero-byte samples into the TX DMA buffer, until it is full.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2s_num: I2S_NUM_0, I2S_NUM_1

esp_err_t i2s_set_clk (i2s_port_t i2s_num, uint32_t rate, i2s_bits_per_sample_t bits, i2s_channel_t ch)
Set clock & bit width used for I2S RX and TX.
Similar to i2s_set_sample_rates(), but also sets bit width.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM Out of memory

Parameters
• i2s_num: I2S_NUM_0, I2S_NUM_1
• rate: I2S sample rate (ex: 8000, 44100...)
• bits: I2S bit width (I2S_BITS_PER_SAMPLE_16BIT, I2S_BITS_PER_SAMPLE_24BIT, I2S_BITS_PER_SAMPLE_32BIT)
• ch: I2S channel, (I2S_CHANNEL_MONO, I2S_CHANNEL_STEREO)

float i2s_get_clk (i2s_port_t i2s_num)
get clock set on particular port number.

Return
• actual clock set by i2s driver

Parameters
• i2s_num: I2S_NUM_0, I2S_NUM_1

esp_err_t i2s_set_adc_mode (adc_unit_t adc_unit, adc1_channel_t adc_channel)
Set built-in ADC mode for I2S DMA, this function will initialize ADC pad, and set ADC parameters.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• adc_unit: SAR ADC unit index
• adc_channel: ADC channel index
esp_err_t i2s_adc_enable(i2s_port_t i2s_num)
Start to use I2S built-in ADC mode.

Note This function would acquire the lock of ADC to prevent the data getting corrupted during the I2S peripheral is being used to do fully continuous ADC sampling.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_INVALID_STATE Driver state error

Parameters
• i2s_num: i2s port index

esp_err_t i2s_adc_disable(i2s_port_t i2s_num)
Stop to use I2S built-in ADC mode.

Note This function would release the lock of ADC so that other tasks can use ADC.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_INVALID_STATE Driver state error

Parameters
• i2s_num: i2s port index

Type Definitions
typedef intr_handle_t i2s_isr_handle_t

Header File

• soc/include/hal/i2s_types.h

Structures

struct i2s_config_t
I2S configuration parameters for i2s_param_config function.

Public Members

i2s_mode_t mode
I2S work mode

int sample_rate
I2S sample rate
i2s_bits_per_sample_t \texttt{bits\_per\_sample}
I2S bits per sample

i2s_channel_fmt_t \texttt{channel\_format}
I2S channel format

i2s_comm_format_t \texttt{communication\_format}
I2S communication format

int \texttt{intr\_alloc\_flags}
Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info

int \texttt{dma\_buf\_count}
I2S DMA Buffer Count

int \texttt{dma\_buf\_len}
I2S DMA Buffer Length

bool \texttt{use\_apll}
I2S using APLL as main I2S clock, enable it to get accurate clock

bool \texttt{tx\_desc\_auto\_clear}
I2S auto clear tx descriptor if there is underflow condition (helps in avoiding noise in case of data unavailability)

int \texttt{fixed\_mclk}
I2S using fixed MCLK output. If use_apll = true and fixed_mclk > 0, then the clock output for i2s is fixed and equal to the fixed_mclk value.

\textbf{struct i2s\_event\_t}
Event structure used in I2S event queue.

\textbf{Public Members}

\texttt{i2s\_event\_type\_t \texttt{type}}
I2S event type

\texttt{size\_t \texttt{size}}
I2S data size for I2S\_DATA event

\textbf{struct i2s\_pin\_config\_t}
I2S pin number for i2s_set_pin.

\textbf{Public Members}

int \texttt{bck\_io\_num}
BCK in out pin

int \texttt{ws\_io\_num}
WS in out pin

int \texttt{data\_out\_num}
DATA out pin

int \texttt{data\_in\_num}
DATA in pin
Macros

**I2S_PIN_NO_CHANGE**
Use in `i2s_pin_config_t` for pins which should not be changed

Type Definitions

```c
typedef int i2s_port_t
```

I2S port number, the max port number is (I2S_NUM_MAX -1).

Enumerations

```c
enum i2s_bits_per_sample_t
```

I2S bit width per sample.

Values:

- `I2S_BITS_PER_SAMPLE_8BIT` = 8
  I2S bits per sample: 8-bits
- `I2S_BITS_PER_SAMPLE_16BIT` = 16
  I2S bits per sample: 16-bits
- `I2S_BITS_PER_SAMPLE_24BIT` = 24
  I2S bits per sample: 24-bits
- `I2S_BITS_PER_SAMPLE_32BIT` = 32
  I2S bits per sample: 32-bits

```c
enum i2s_channel_t
```

I2S channel.

Values:

- `I2S_CHANNEL_MONO` = 1
  I2S 1 channel (mono)
- `I2S_CHANNEL_STEREO` = 2
  I2S 2 channel (stereo)

```c
enum i2s_comm_format_t
```

I2S communication standard format.

Values:

- `I2S_COMM_FORMAT_I2S` = 0x01
  I2S communication format I2S
- `I2S_COMM_FORMAT_I2S_MSB` = 0x02
  I2S format MSB
- `I2S_COMM_FORMAT_I2S_LSB` = 0x04
  I2S format LSB
- `I2S_COMM_FORMAT_PCM` = 0x08
  I2S communication format PCM
- `I2S_COMM_FORMAT_PCM_SHORT` = 0x10
  PCM Short
I2S COMM FORMAT_PCM_LONG = 0x20
   PCM Long

denum i2s_channel_fmt_t
   I2S channel format type.

   Values:
   I2S_CHANNEL_FMT_RIGHT_LEFT = 0x00
   I2S_CHANNEL_FMT_ALL_RIGHT
   I2S_CHANNEL_FMT_ALL_LEFT
   I2S_CHANNEL_FMT_ONLY_RIGHT
   I2S_CHANNEL_FMT_ONLY_LEFT

denum pdm_sample_rate_ratio_t
   PDM sample rate ratio, measured in Hz.

   Values:
   PDM_SAMPLE_RATE_RATIO_64
   PDM_SAMPLE_RATE_RATIO_128

denum pdm_pcm_conv_t
   PDM PCM convter enable/disable.

   Values:
   PDM_PCM_CONV_ENABLE
   PDM_PCM_CONV_DISABLE

denum i2s_mode_t
   I2S Mode, default is I2S_MODE_MASTER | I2S_MODE_TX.

   Note PDM and built-in DAC functions are only supported on I2S0 for current ESP32 chip.

   Values:
   I2S_MODE_MASTER = 1
   I2S_MODE_SLAVE = 2
   I2S_MODE_TX = 4
   I2S_MODE_RX = 8
   I2S_MODE_DAC_BUILT_IN = 16
      Output I2S data to built-in DAC, no matter the data format is 16bit or 32 bit, the DAC module will only take the 8bits from MSB
   I2S_MODE_ADC_BUILT_IN = 32
      Input I2S data from built-in ADC, each data can be 12-bit width at most

denum i2s_event_type_t
   I2S event types.

   Values:
   I2S_EVENT_DMA_ERROR
   I2S_EVENT_TX_DONE
      I2S DMA finish sent 1 buffer
I2S_EVENT_RX_DONE
I2S DMA finish received 1 buffer

I2S_EVENT_MAX
I2S event max index

enum i2s_dac_mode_t
I2S DAC mode for i2s_set_dac_mode.

Note PDM and built-in DAC functions are only supported on I2S0 for current ESP32 chip.

Values:

I2S_DAC_CHANNEL_DISABLE = 0
Disable I2S built-in DAC signals

I2S_DAC_CHANNEL_RIGHT_EN = 1
Enable I2S built-in DAC right channel, maps to DAC channel 1 on GPIO25

I2S_DAC_CHANNEL_LEFT_EN = 2
Enable I2S built-in DAC left channel, maps to DAC channel 2 on GPIO26

I2S_DAC_CHANNEL_BOTH_EN = 0x3
Enable both of the I2S built-in DAC channels.

I2S_DAC_CHANNEL_MAX = 0x4
I2S built-in DAC mode max index

enum i2s_clock_src_t
Values:

I2S_CLK_D2CLK = 0

I2S_CLK_APLL

2.3.7 LED Control

Introduction
The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes as well. It has 16 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

A half of LEDC’s channels operate in high speed mode. This mode is implemented in hardware and offers automatic and glitch-free changing of the PWM duty cycle. The other half of channels operate in low speed mode, where the moment of change depends on the application software. Each group of channels is also able to use different clock sources, but this feature is not yet supported in the LEDC driver.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

Functionality Overview
Getting LEDC to work on a specific channel in either high or low speed mode is done in three steps:

1. Configure Timer by specifying the PWM signal’s frequency and duty cycle resolution.
2. Configure Channel by associating it with the timer and GPIO to output the PWM signal.
3. Change PWM Signal that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on the fade end.

![Diagram of LED PWM Controller](image)

**Configure Timer**

Setting the timer is done by calling the function `ledc_timer_config()` and passing to it a data structure `ledc_timer_config_t` that contains the following configuration settings:

- Timer number `ledc_timer_t`
- Speed mode `ledc_mode_t`
- PWM signal frequency
- Resolution of PWM duty

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower duty resolution is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section Supported Range of Frequency and Duty Resolutions.

**Configure Channel**

When the timer is set up, configure a selected channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel’s configuration parameters.
At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

### Change PWM Signal

Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal’s frequency can also be changed; it is covered in Section Change PWM Frequency.

#### Change PWM Duty Cycle Using Software

To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding _get_ function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section Configure Channel.

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to `(2 ** duty_resolution) - 1`. For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of ~0.1%.

#### Change PWM Duty Cycle using Hardware

The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Finally start fading with `ledc_fade_start()`.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

#### Change PWM Frequency

The LEDC API provides several ways to change the PWM frequency “on the fly”:

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

2.3. Peripherals API
More Control Over PWM

There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a “clean” startup of a timer after it is configured.

Use Interrupts

When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

LEDC High and Low Speed Mode

Of the total 8 timers and 16 channels available in the LED PWM Controller, half of them are dedicated to operation in high speed mode and the other half in low speed mode. Selection of a low or high speed timer or channel is done with the parameter `ledc_mode_t` that can be found in applicable function calls.

The advantage of high speed mode is hardware-supported, glitch-free changeover of the timer settings. This means that if the timer settings are modified, the changes will be applied automatically on the next overflow interrupt of the timer. In contrast, when updating the low-speed timer, the change of settings should be explicitly triggered by software. The LEDC driver handles it in the background, e.g., when `ledc_timer_config()` or `ledc_timer_set()` is called.

For additional details regarding speed modes, refer to ESP32 Technical Reference Manual (PDF). Please note that the support for `SLOW_CLOCK` mentioned in this manual is not yet supported in the LEDC driver.

Supported Range of Frequency and Duty Resolutions

The LED PWM Controller is designed primarily to drive LEDs. It provides a wide resolution for PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. It means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% (2 ** 13 = 8192 discrete levels of the LED intensity).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try __reducing freq_hz or duty_resolution. div_param=128
```
In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

**Application Example**

The LEDC change duty cycle and fading control example: `peripherals/ledc`.

**API Reference**

**Header File**

- `driver/include/driver/ledc.h`

**Functions**

`esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)`  
LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `ledc_conf`: Pointer of LEDC channel configure struct

`esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)`  
LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

**Parameters**

- `timer_conf`: Pointer of LEDC timer configure struct

`esp_err_t ledc_update_duty(ledc_mode_t speed_mode, ledc_channel_t channel)`  
LEDC update channel parameters.
Note Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings.

Note `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `speed_mode`: Select the LEDC speed_mode, high-speed mode and low-speed mode,
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`

```c
esp_err_t ledc_set_pin(int gpio_num, ledc_mode_t speed_mode, ledc_channel_t ledc_channel)
```
Set LEDC output gpio.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `gpio_num`: The LEDC output gpio
- `speed_mode`: Select the LEDC speed_mode, high-speed mode and low-speed mode
- `ledc_channel`: LEDC channel (0-7), select from `ledc_channel_t`

```c
esp_err_t ledc_stop(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t idle_level)
```
LEDC stop. Disable LEDC output, and set idle level.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `speed_mode`: Select the LEDC speed_mode, high-speed mode and low-speed mode
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`
- `idle_level`: Set output idle level after LEDC stops.

```c
esp_err_t ledc_set_freq(ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz)
```
LEDC set channel frequency (Hz)

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.
Parameters

- **speed_mode**: Select the LEDC speed_mode, high-speed mode and low-speed mode
- **timer_num**: LEDC timer index (0-3), select from ledc_timer_t
- **freq_hz**: Set the LEDC frequency

```c
uint32_t ledc_get_freq(ledc_mode_t speed_mode, ledc_timer_t timer_num)
```

LEDC get channel frequency (Hz)

Return

- 0 error
- Others Current LEDC frequency

Parameters

- **speed_mode**: Select the LEDC speed_mode, high-speed mode and low-speed mode
- **timer_num**: LEDC timer index (0-3), select from ledc_timer_t

```c
esp_err_t ledc_set_duty_with_hpoint(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```

LEDC set duty and hpoint value Only after calling ledc_update_duty will the duty update.

**Note** ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **speed_mode**: Select the LEDC speed_mode, high-speed mode and low-speed mode
- **channel**: LEDC channel (0-7), select from ledc_channel_t
- **duty**: Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]
- **hpoint**: Set the LEDC hpoint value(max: 0xfffff)

```c
int ledc_get_hpoint(ledc_mode_t speed_mode, ledc_channel_t channel)
```

LEDC get hpoint value, the counter value when the output is set high level.

Return

- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

Parameters

- **speed_mode**: Select the LEDC speed_mode, high-speed mode and low-speed mode
- **channel**: LEDC channel (0-7), select from ledc_channel_t

2.3. Peripherals API
esp_err_t ledc_set_duty(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call 
ledc_set_duty_with_hpoint. only after calling ledc_update_duty will the duty update.

Note ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these 
functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is 
ledc_set_duty_and_update.

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. 
Other duty operations will have to wait until the fade operation has finished.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
• channel: LEDC channel (0-7), select from ledc_channel_t
• duty: Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]

uint32_t ledc_get_duty(ledc_mode_t speed_mode, ledc_channel_t channel)

LEDC get duty.

Return
• LEDC_ERR_DUTY if parameter error
• Others Current LEDC duty

Parameters
• speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
• channel: LEDC channel (0-7), select from ledc_channel_t

esp_err_t ledc_set_fade(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, 
ledc_duty_direction_t fade_direction, uint32_t step_num, uint32_t duty_cycle_num, uint32_t duty_scale)

LEDC set gradient Set LEDC gradient, After the function calls the ledc_update_duty function, the function can 
take effect.

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. 
Other duty operations will have to wait until the fade operation has finished.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
• channel: LEDC channel (0-7), select from ledc_channel_t
• duty: Set the start of the gradient duty, the range of duty setting is [0, (2**duty_resolution)]
• fade_direction: Set the direction of the gradient
• step_num: Set the number of the gradient
• duty_cycle_num: Set how many LEDC tick each time the gradient lasts
• duty_scale: Set gradient change amplitude

```c
esp_err_t ledc_isr_register( void (*fn) void *, void *arg, int intr_alloc_flags, ledc_isr_handle_t *handle) Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.
```

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**

• fn: Interrupt handler function.
• arg: User-supplied argument passed to the handler function.
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
• handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

```c
esp_err_t ledc_timer_set( ledc_mode_t speed_mode, ledc_timer_t timer_sel, uint32_t clock_divider, uint32_t duty_resolution, ledc_clk_src_t clk_src) Configure LEDC settings.
```

**Return**

• (-1) Parameter error
• Other Current LEDC duty

**Parameters**

• speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
• timer_sel: Timer index (0-3), there are 4 timers in LEDC module
• clock_divider: Timer clock divide value, the timer clock is divided from the selected clock source
• duty_resolution: Resolution of duty setting in number of bits. The range of duty values is [0, (2**duty_resolution)]
• clk_src: Select LEDC source clock.

```c
esp_err_t ledc_timer_rst( ledc_mode_t speed_mode, ledc_timer_t timer_sel) Reset LEDC timer.
```

**Return**

• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**

• speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
• timer_sel: LEDC timer index (0-3), select from ledc_timer_t
esp_err_t ledc_timer_pause (ledc_mode_t speed_mode, ledc_timer_t timer_sel)
Pause LEDC timer counter.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
• timer_sel: LEDC timer index (0-3), select from ledc_timer_t

est_err_t ledc_timer_resume (ledc_mode_t speed_mode, ledc_timer_t timer_sel)
Resume LEDC timer.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
• timer_sel: LEDC timer index (0-3), select from ledc_timer_t

esp_err_t ledc_bind_channel_timer (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_timer_t timer_sel)
Bind LEDC channel with the selected timer.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
• channel: LEDC channel index (0-7), select from ledc_channel_t
• timer_sel: LEDC timer index (0-3), select from ledc_timer_t

esp_err_t ledc_set_fade_with_step (ledc_mode_t speed_modbolde, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)
Set LEDC fade function.

Note Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

Note ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- `speed_mode`: Select the LEDC speed mode, high-speed mode and low-speed mode,
- `channel`: LEDC channel index (0-7), select from ledc_channel_t
- `target_duty`: Target duty of fading \([0, (2^{duty\_resolution}) - 1]\)
- `scale`: Controls the increase or decrease step scale.
- `cycle_num`: increase or decrease the duty every cycle_num cycles

```c
esp_err_t ledc_set_fade_with_time(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, int max_fade_time_ms)
```

Set LEDC fade function, with a limited time.

**Note** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- `speed_mode`: Select the LEDC speed mode, high-speed mode and low-speed mode,
- `channel`: LEDC channel index (0-7), select from ledc_channel_t
- `target_duty`: Target duty of fading \((0 - (2^{duty\_resolution} - 1))\)
- `max_fade_time_ms`: The maximum time of the fading (ms).

```c
esp_err_t ledc_fade_func_install(int intr_alloc_flags)
```

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function already installed.

**Parameters**
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
void **ledc_fade_func_uninstall**(void)
Uninstall LEDC fade function.

```c
esp_err_t ledc_fade_start(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_fade_mode_t fade_mode)
```
Start LEDC fading.

**Note** Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

**Parameters**
- `speed_mode`: Select the LEDC speed_mode, high-speed mode and low-speed mode
- `channel`: LEDC channel number
- `fade_mode`: Whether to block until fading done.

```c
esp_err_t ledc_set_duty_and_update(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```
A thread-safe API to set duty for LEDC channel and return when duty updated.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Parameters**
- `speed_mode`: Select the LEDC speed_mode, high-speed mode and low-speed mode
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`
- `duty`: Set the LEDC duty, the range of duty setting is \([0, (2^{\text{duty_resolution}})]\)
- `hpoint`: Set the LEDC hpoint value(max: 0xfffff)

```c
esp_err_t ledc_set_fade_time_and_start(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t max_fade_time_ms, ledc_fade_mode_t fade_mode)
```
A thread-safe API to set and start LEDC fade function, with a limited time.

**Note** Call `ledc_fade_func_install()` once, before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error
Parameters

- **speed_mode**: Select the LEDC speed_mode, high-speed mode and low-speed mode,
- **channel**: LEDC channel index (0-7), select from ledc_channel_t
- **target_duty**: Target duty of fading. \(0 \leq (2^\text{duty_resolution} - 1)\)
- **max_fade_time_ms**: The maximum time of the fading (ms).
- **fade_mode**: choose blocking or non-blocking mode

```c
esp_err_t ledc_set_fade_step_and_start(ledc_mode_t speed_mode, ledc_channel_t channel,
                        uint32_t target_duty, uint32_t scale, uint32_t cycle_num,
                        ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function.

**Note** Call ledc_fade_func_install() once before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**

- **speed_mode**: Select the LEDC speed_mode, high-speed mode and low-speed mode,
- **channel**: LEDC channel index (0-7), select from ledc_channel_t
- **target_duty**: Target duty of fading \([0, (2^{\text{duty_resolution}}) - 1]\)
- **scale**: Controls the increase or decrease step scale.
- **cycle_num**: increase or decrease the duty every cycle_num cycles
- **fade_mode**: choose blocking or non-blocking mode

**Macros**

- LEDC_APB_CLK_HZ
- LEDC_REF_CLK_HZ
- LEDC_ERR_DUTY
- LEDC_ERR_VAL

**Type Definitions**

```c
typedef intr_handle_t ledc_isr_handle_t
```
Header File

- soc/include/hal/ledc_types.h

Structures

```c
struct ledc_channel_config_t

  Configuration parameters of LEDC channel for ledc_channel_config function.

  Public Members

  int gpio_num
    the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

  ledc_mode_t speed_mode
    LEDC speed speed_mode, high-speed mode or low-speed mode

  ledc_channel_t channel
    LEDC channel (0 - 7)

  ledc_intr_type_t intr_type
    configure interrupt, Fade interrupt enable or Fade interrupt disable

  ledc_timer_t timer_sel
    Select the timer source of channel (0 - 3)

  uint32_t duty
    LEDC channel duty, the range of duty setting is [0, (2**duty_resolution)]

  int hpoint
    LEDC channel hpoint value, the max value is 0xffffffff
```

```c
struct ledc_timer_config_t

  Configuration parameters of LEDC Timer timer for ledc_timer_config function.

  Public Members

  ledc_mode_t speed_mode
    LEDC speed speed_mode, high-speed mode or low-speed mode

  ledc_timer_bit_t duty_resolution
    LEDC channel duty resolution

  ledc_timer_bit_t bit_num
    Deprecated in ESP-IDF 3.0. This is an alias to ‘duty_resolution’ for backward compatibility with ESP-IDF 2.1

  ledc_timer_t timer_num
    The timer source of channel (0 - 3)

  uint32_t freq_hz
    LEDC timer frequency (Hz)

  ledc_clk_cfg_t clk_cfg
    Configure LEDC source clock. For low speed channels and high speed channels, you can specify the source clock using LEDC_USE_REF_TICK, LEDC_USE_APB_CLK or LEDC_AUTO_CLK. For low
speed channels, you can also specify the source clock using LEDC_USE_RTC8M_CLK, in this case, all low speed channel’s source clock must be RTC8M_CLK

**Enumerations**

```c
enum ledc_mode_t
Values:

LEDC_LOW_SPEED_MODE
LEDC low speed speed_mode

LEDC_SPEED_MODE_MAX
LEDC speed limit

enum ledc_intr_type_t
Values:

LEDC_INTR_DISABLE = 0
Disable LEDC interrupt

LEDC_INTR_FADE_END
Enable LEDC interrupt

LEDC_INTR_MAX

enum ledc_duty_direction_t
Values:

LEDC_DUTY_DIR_DECREASE = 0
LEDC duty decrease direction

LEDC_DUTY_DIR_INCREASE = 1
LEDC duty increase direction

LEDC_DUTY_DIR_MAX

enum ledc_slow_clk_sel_t
Values:

LEDC_SLOW_CLK_RTC8M = 0
LEDC low speed timer clock source is 8MHz RTC clock

LEDC_SLOW_CLK_APB
LEDC low speed timer clock source is 80MHz APB clock

enum ledc_clk_cfg_t
Values:

LEDC_AUTO_CLK = 0
The driver will automatically select the source clock(REF_TICK or APB) based on the giving resolution and duty parameter when init the timer

LEDC_USE_REF_TICK
LEDC timer select REF_TICK clock as source clock

LEDC_USE_APB_CLK
LEDC timer select APB clock as source clock

LEDC_USE_RTC8M_CLK
LEDC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels
```
enum ledc_clk_src_t
Values:

LEDC_REF_TICK = LEDC_USE_REF_TICK
    LEDC timer clock divided from reference tick (1Mhz)

LEDC_APB_CLK = LEDC_USE_APB_CLK
    LEDC timer clock divided from APB clock (80Mhz)

enum ledc_timer_t
Values:

LEDC_TIMER_0 = 0
    LEDC timer 0

LEDC_TIMER_1
    LEDC timer 1

LEDC_TIMER_2
    LEDC timer 2

LEDC_TIMER_3
    LEDC timer 3

LEDC_TIMER_MAX

enum ledc_channel_t
Values:

LEDC_CHANNEL_0 = 0
    LEDC channel 0

LEDC_CHANNEL_1
    LEDC channel 1

LEDC_CHANNEL_2
    LEDC channel 2

LEDC_CHANNEL_3
    LEDC channel 3

LEDC_CHANNEL_4
    LEDC channel 4

LEDC_CHANNEL_5
    LEDC channel 5

LEDC_CHANNEL_6
    LEDC channel 6

LEDC_CHANNEL_7
    LEDC channel 7

LEDC_CHANNEL_MAX

enum ledc_timer_bit_t
Values:

LEDC_TIMER_1_BIT = 1
    LEDC PWM duty resolution of 1 bits

LEDC_TIMER_2_BIT
    LEDC PWM duty resolution of 2 bits
LEDC_TIMER_3_BIT
   LEDC PWM duty resolution of 3 bits

LEDC_TIMER_4_BIT
   LEDC PWM duty resolution of 4 bits

LEDC_TIMER_5_BIT
   LEDC PWM duty resolution of 5 bits

LEDC_TIMER_6_BIT
   LEDC PWM duty resolution of 6 bits

LEDC_TIMER_7_BIT
   LEDC PWM duty resolution of 7 bits

LEDC_TIMER_8_BIT
   LEDC PWM duty resolution of 8 bits

LEDC_TIMER_9_BIT
   LEDC PWM duty resolution of 9 bits

LEDC_TIMER_10_BIT
   LEDC PWM duty resolution of 10 bits

LEDC_TIMER_11_BIT
   LEDC PWM duty resolution of 11 bits

LEDC_TIMER_12_BIT
   LEDC PWM duty resolution of 12 bits

LEDC_TIMER_13_BIT
   LEDC PWM duty resolution of 13 bits

LEDC_TIMER_14_BIT
   LEDC PWM duty resolution of 14 bits

LEDC_TIMER_15_BIT
   LEDC PWM duty resolution of 15 bits

LEDC_TIMER_16_BIT
   LEDC PWM duty resolution of 16 bits

LEDC_TIMER_17_BIT
   LEDC PWM duty resolution of 17 bits

LEDC_TIMER_18_BIT
   LEDC PWM duty resolution of 18 bits

LEDC_TIMER_19_BIT
   LEDC PWM duty resolution of 19 bits

LEDC_TIMER_20_BIT
   LEDC PWM duty resolution of 20 bits

LEDC_TIMER_BIT_MAX

enum ledc_fade_mode_t

Values:

LEDC_FADE_NO_WAIT = 0
   LEDC fade function will return immediately

LEDC_FADE_WAIT_DONE
   LEDC fade function will block until fading to the target duty
2.3.8 MCPWM

ESP32 has two MCPWM units which can be used to control different types of motors. Each unit has three pairs of PWM outputs.

![MCPWM Overview](image)

Fig. 15: MCPWM Overview

Further in documentation the outputs of a single unit are labeled \( \text{PWM}_A / \text{PWM}_B \). More detailed block diagram of the MCPWM unit is shown below. Each A/B pair may be clocked by any one of the three timers Timer 0, 1 and 2. The same timer may be used to clock more than one pair of PWM outputs. Each unit is also able to collect inputs such as SYNC SIGNALS, detect FAULT SIGNALS like motor overcurrent or overvoltage, as well as obtain feedback with CAPTURE SIGNALS on e.g. a rotor position.

Description of this API starts with configuration of MCPWM’s Timer and Generator submodules to provide the basic motor control functionality. Then it discusses more advanced submodules and functionalities of a Fault Handler, signal Capture, Carrier and Interrupts.

Contents

- **Configure** a basic functionality of the outputs
- **Operate** the outputs to drive a motor
- **Adjust** how the motor is driven
- **Capture** external signals to provide additional control over the outputs
- **Use** Fault Handler to detect and manage faults
- Add a higher frequency Carrier, if output signals are passed through an isolation transformer
- Configuration and handling of Interrupts.
Fig. 16: MCPWM Block Diagram
Configure

The scope of configuration depends on the motor type, in particular how many outputs and inputs are required, and what will be the sequence of signals to drive the motor.

In this case we will describe a simple configuration to control a brushed DC motor that is using only some of the available MCPWM’s resources. An example circuit is shown below. It includes a H-Bridge to switch polarization of a voltage applied to the motor (M) and to provide sufficient current to drive it.

![Example of Brushed DC Motor Control with MCPWM](image)

**Fig. 17: Example of Brushed DC Motor Control with MCPWM**

Configuration covers the following steps:

1. Selection of a MPWn unit that will be used to drive the motor. There are two units available on-board of ESP32 and enumerated in `mcpwm_unit_t`.

2. Initialization of two GPIOs as output signals within selected unit by calling `mcpwm_gpio_init()`. The two output signals are typically used to command the motor to rotate right or left. All available signal options are listed in `mcpwm_io_signals_t`. To set more than a single pin at a time, use function `mcpwm_set_pin()` together with `mcpwm_pin_config_t`.

3. Selection of a timer. There are three timers available within the unit. The timers are listed in `mcpwm_timer_t`.

4. Setting of the timer frequency and initial duty within `mcpwm_config_t` structure.

5. Calling of `mcpwm_init()` with the above parameters to make the configuration effective.

Operate

To operate a motor connected to the MCPWM unit, e.g. turn it left or right, or vary the speed, we should apply some control signals to the unit’s outputs. The outputs are organized into three pairs. Within a pair they are labeled “A” and “B” and each driven by a submodule called an “Generator”. To provide a PWM signal, the Operator itself, which contains two Generator, should be clocked by one of three available Timers. To make the API simpler, each Timer is automatically associated by the API to drive an Operator of the same index, e.g. Timer 0 is associated with Operator 0.

There are the following basic ways to control the outputs:
• We can drive particular signal steady high or steady low with function `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()`. This will make the motor to turn with a maximum speed or stop. Depending on selected output A or B the motor will rotate either right or left.

• Another option is to drive the outputs with the PWM signal by calling `mcpwm_start()` or `mcpwm_stop()`. The motor speed will be proportional to the PWM duty.

• To vary PWM’s duty call `mcpwm_set_duty()` and provide the duty value in %. Optionally, you may call `mcpwm_set_duty_in_us()`, if you prefer to set the duty in microseconds. Checking of currently set value is possible by calling `mcpwm_get_duty()`. Phase of the PWM signal may be altered by calling `mcpwm_set_duty_type()`. The duty is set individually for each A and B output using `mcpwm_generator_t` in specific function calls. The duty value refers either to high or low output signal duration. This is configured when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of options from `mcpwm_duty_type_t`.

Note: Call function `mcpwm_set_duty_type()` every time after `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()` to resume with previously set duty cycle.

Adjust

There are couple of ways to adjust a signal on the outputs and changing how the motor operates.

• Set specific PWM frequency by calling `mcpwm_set_frequency()`. This may be required to adjust to electrical or mechanical characteristics of particular motor and driver. To check what frequency is set, use function `mcpwm_get_frequency()`.

• Introduce a dead time between outputs A and B when they are changing the state to reverse direction of the motor rotation. This is to make up for on/off switching delay of the motor driver FETs. The dead time options are defined in `mcpwm_deadtime_type_t` and enabled by calling `mcpwm_deadtime_enable()`. To disable this functionality call `mcpwm_deadtime_disable()`.

• Synchronize outputs of operator submodules, e.g. to get raising edge of PWM0A/B and PWM1A/B to start exactly at the same time, or shift them between each other by a given phase. Synchronization is triggered by SYNC SIGNALS shown on the block diagram of the MCPWM above, and defined in `mcpwm_sync_signal_t`. To attach the signal to a GPIO call `mcpwm_gpio_init()`. You can then enable synchronization with function `mcpwm_sync_enable()`. As input parameters provide MCPWM unit, timer to synchronize, the synchronization signal and a phase to delay the timer.

Note: Synchronization signals are referred to using two different enumerations. First one `mcpwm_io_signals_t` is used together with function `mcpwm_gpio_init()` when selecting a GPIO as the signal input source. The second one `mcpwm_sync_signal_t` is used when enabling or disabling synchronization with `mcpwm_sync_enable()` or `mcpwm_sync_disable()`.

• Vary the pattern of the A/B output signals by getting MCPWM counters to count up, down and up/down (automatically changing the count direction). Respective configuration is done when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of counter types from `mcpwm_counter_type_t`. For explanation of how A/B PWM output signals are generated please refer to ESP32 Technical Reference Manual.

Capture

One of requirements of BLDC (Brushless DC, see figure below) motor control is sensing of the rotor position. To facilitate this task each MCPWM unit provides three sensing inputs together with dedicated hardware. The hardware
is able to detect the input signal’s edge and measure time between signals. As result the control software is simpler and the CPU power may be used for other tasks.

![Diagram of MCPWM and Motor Driver](image-url)

**Fig. 18: Example of Brushless DC Motor Control with MCPWM**

The capture functionality may be used for other types of motors or tasks. The functionality is enabled in two steps:

1. Configuration of GPIOs to act as the capture signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, that were described in section `Configure`.

2. Enabling of the functionality itself by invoking `mcpwm_capture_enable()`, selecting desired signal input from `mcpwm_capture_signal_t`, setting the signal edge with `mcpwm_capture_on_edge_t` and the signal count prescaler.

Within the second step above a 32-bit capture timer is enabled. The timer runs continuously driven by the APB clock. The clock frequency is typically 80 MHz. On each capture event the capture timer’s value is stored in time-stamp register that may be then checked by calling `mcpwm_capture_signal_get_value()`. The edge of the last signal may be checked with `mcpwm_capture_signal_get_edge()`.

If not required anymore, the capture functionality may be disabled with `mcpwm_capture_disable()`.

**Fault Handler**

Each unit of the MCPWM is able to sense external signals with information about failure of the motor, the motor driver or any other device connected to the MCPWM. There are three fault inputs per unit that may be routed to user selectable GPIOs. The MCPWM may be configured to perform one of four predefined actions on A/B outputs when a fault signal is received:

- lock current state of the output
- set the output low
• set the output high
• toggle the output

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

The fault handler functionality is enabled in two steps:

1. Configuration of GPIOs to act as fault signal inputs. This is done in analogous way as described for capture signals in section above. It includes setting the signal level to trigger the fault as defined in `mcpwm_fault_input_level_t`.

2. Initialization of the fault handler by calling either `mcpwm_fault_set_oneshot_mode()` or `mcpwm_fault_set_cyc_mode()`. These functions set the mode that MCPWM should operate once fault signal becomes inactive. There are two modes possible:
   • State of MCPWM unit will be locked until reset - `mcpwm_fault_set_oneshot_mode()`.
   • The MCPWM will resume operation once fault signal becoming inactive - `mcpwm_fault_set_cyc_mode()`.

The function call parameters include selection of one of three fault inputs defined in `mcpwm_fault_signal_t` and specific action on outputs A and B defined in `mcpwm_action_on_pwmxa_t` and `mcpwm_action_on_pwmxb_t`.

Particular fault signal may be disabled at the runtime by calling `mcpwm_fault_deinit()`.

Carrier

The MCPWM has a carrier submodule used if galvanic isolation from the motor driver is required by passing the A/B output signals through transformers. Any of A and B output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To use the carrier submodule, it should be first initialized by calling `mcpwm_carrier_init()`. The carrier parameters are defined in `mcpwm_carrier_config_t` structure invoked within the function call. Then the carrier functionality may be enabled by calling `mcpwm_carrier_enable()`.

The carrier parameters may be then alerted at a runtime by calling dedicated functions to change individual fields of the `mcpwm_carrier_config_t` structure, like `mcpwm_carrier_set_period()`, `mcpwm_carrier_set_duty_cycle()`, `mcpwm_carrier_output_invert()`, etc.

This includes enabling and setting duration of the first pulse of the career with `mcpwm_carrier_oneshot_mode_enable()`. For more details please refer to “PWM Carrier Submodule” section of the ESP32 Technical Reference Manual.

To disable carrier functionality call `mcpwm_carrier_disable()`.

Interrupts

Registering of the MCPWM interrupt handler is possible by calling `mcpwm_isr_register()`.

Application Example

Examples of using MCPWM for motor control: `peripherals/mcpwm`:
   • Demonstration how to use each submodule of the MCPWM - `peripherals/mcpwm/mcpwm_basic_config`
• Control of BLDC (brushless DC) motor with hall sensor feedback - peripherals/mcpwm/mcpwm_bldc_control
• Brushed DC motor control - peripherals/mcpwm/mcpwm_brushed_dc_control
• Servo motor control - peripherals/mcpwm/mcpwm_servo_control

API Reference

Header File

• soc/include/hal/mcpwm_types.h

Enumerations

enum mcpwm_intr_t
    Interrupts for MCPWM.
    Values:
    MCPWM_LL_INTR_CAP0 = BIT(27)
        Capture 0 happened.
    MCPWM_LL_INTR_CAP1 = BIT(28)
        Capture 1 happened.
    MCPWM_LL_INTR_CAP2 = BIT(29)
        Capture 2 happened.

enum mcpwm_counter_type_t
    Select type of MCPWM counter.
    Values:
    MCPWM_UP_COUNTER = 1
        For asymmetric MCPWM
    MCPWM_DOWN_COUNTER
        For asymmetric MCPWM
    MCPWM_UP_DOWN_COUNTER
        For symmetric MCPWM, frequency is half of MCPWM frequency set
    MCPWM_COUNTER_MAX
        Maximum counter mode

enum mcpwm_duty_type_t
    Select type of MCPWM duty cycle mode.
    Values:
    MCPWM_DUTY_MODE_0 = 0
        Active high duty, i.e. duty cycle proportional to high time for asymmetric MCPWM
    MCPWM_DUTY_MODE_1
        Active low duty, i.e. duty cycle proportional to low time for asymmetric MCPWM, out of phase(inverted) MCPWM
    MCPWM_HAL_GENERATOR_MODE_FORCE_LOW
    MCPWM_HAL_GENERATOR_MODE_FORCE_HIGH
**enum mcpwm_duty_mode_max**

Num of duty cycle modes

**enum mcpwm_output_action_t**

MCPWM select action to be taken on the output when event happens.

*Values:

- **MCPWM_ACTION_NO_CHANGE** = 0
  No change in the output
- **MCPWM_ACTION_FORCE_LOW**
  Make output low
- **MCPWM_ACTION_FORCE_HIGH**
  Make output high
- **MCPWM_ACTION_TOGGLE**
  Make output toggle

**enum mcpwm_deadtime_type_t**

MCPWM deadtime types, used to generate deadtime, RED refers to rising edge delay and FED refers to falling edge delay.

*Values:

- **MCPWM_DEADTIME_BYPASS** = 0
  Bypass the deadtime
- **MCPWM_BYPASS_RED**
  MCPWMXA = no change, MCPWMXB = falling edge delay
- **MCPWM_BYPASS_FED**
  MCPWMXA = rising edge delay, MCPWMXB = no change
- **MCPWM_ACTIVE_HIGH_MODE**
  MCPWMXA = rising edge delay, MCPWMXB = falling edge delay
- **MCPWM_ACTIVE_LOW_MODE**
  MCPWMXA = compliment of rising edge delay, MCPWMXB = compliment of falling edge delay
- **MCPWM_ACTIVE_HIGH_COMPLIMENT_MODE**
  MCPWMXA = rising edge delay, MCPWMXB = compliment of falling edge delay
- **MCPWM_ACTIVE_LOW_COMPLIMENT_MODE**
  MCPWMXA = compliment of rising edge delay, MCPWMXB = falling edge delay
- **MCPWM_ACTIVE_RED_FED_FROM_PWMXA**
  MCPWMXA = MCPWMXB = rising edge delay as well as falling edge delay, generated from MCPWMXA
- **MCPWM_ACTIVE_RED_FED_FROM_PWMXB**
  MCPWMXA = MCPWMXB = rising edge delay as well as falling edge delay, generated from MCPWMXB

**enum mcpwm_sync_signal_t**

MCPWM select sync signal input.

*Values:

- **MCPWM_SELECT_SYNC0** = 4
  Select SYNC0 as input
**MCPWM_SELECT_SYNC1**
Select SYNC1 as input

**MCPWM_SELECT_SYNC2**
Select SYNC2 as input

```c
enum mcpwm_capture_on_edge_t
MCPWM select capture starts from which edge.

Values:

**MCPWM_NEG_EDGE** = BIT(0)
Capture the negative edge

**MCPWM_POS_EDGE** = BIT(1)
Capture the positive edge
```

**Header File**

- driver/include/driver/mcpwm.h

**Functions**

```c
esp_err_t mcpwm_gpio_init(mcpwm_unit_t mcpwm_num, mcpwm_io_signals_t io_signal, int gpio_num)
This function initializes each gpio signal for MCPWM.

Note  This function initializes one gpio at a time.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- mcpwm_num: set MCPWM unit(0-1)
- io_signal: set MCPWM signals, each MCPWM unit has 6 output(MCPWMXA, MCPWMXB) and 9 input(SYNC_X, FAULT_X, CAP_X) ‘X’ is timer_num(0-2)
- gpio_num: set this to configure gpio for MCPWM, if you want to use gpio16, gpio_num = 16
```

```c
esp_err_t mcpwm_set_pin(mcpwm_unit_t mcpwm_num, const mcpwm_pin_config_t *mcpwm_pin)
Initialize MCPWM gpio structure.

Note  This function can be used to initialize more then one gpio at a time.

Return
```
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• mcpwm_pin: MCPWM pin structure

```
esp_err_t mcpwm_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_config_t *mcpwm_conf)
```

Initialize MCPWM parameters.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers.
• mcpwm_conf: configure structure mcpwm_config_t

```
esp_err_t mcpwm_set_frequency(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint32_t frequency)
```

Set frequency(in Hz) of MCPWM timer.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• frequency: set the frequency in Hz of each timer

```
esp_err_t mcpwm_set_duty(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, float duty)
```

Set duty cycle of each operator(MCPWMXA/MCPWMXB)

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen: set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected
• duty: set duty cycle in % (i.e for 62.3% duty cycle, duty = 62.3) of each operator
esp_err_t mcpwm_set_duty_in_us(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, uint32_t duty_in_us)

Set duty cycle of each operator(MCPWMXA/MCPWMXB) in us.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected
• duty_in_us: set duty value in microseconds of each operator

esp_err_t mcpwm_set_duty_type(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, mcpwm_duty_type_t duty_type)

Set duty either active high or active low(out of phase/inverted)

Note Call this function every time after mcpwm_set_signal_high or mcpwm_set_signal_low to resume with previously set duty cycle

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected
• duty_type: set active low or active high duty type

uint32_t mcpwm_get_frequency(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Get frequency of timer.

Return

• frequency of timer

Parameters

• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

float mcpwm_get_duty(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)

Get duty cycle of each operator.

Return

• duty cycle in % of each operator(56.7 means duty is 56.7%)
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

```c
esp_err_t mcpwm_set_signal_high(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)
```

Use this function to set MCPWM signal high.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the operator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected

```c
esp_err_t mcpwm_set_signal_low(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)
```

Use this function to set MCPWM signal low.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the operator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected

```c
esp_err_t mcpwm_start(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Start MCPWM signal on timer ‘x’.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_stop(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Start MCPWM signal on timer ‘x’.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

2.3. Peripherals API
Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

`esp_err_t mcpwm_carrier_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_carrier_config_t *carrier_conf)`

Initialize carrier configuration.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_conf`: configure structure `mcpwm_carrier_config_t`

`esp_err_t mcpwm_carrier_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)`

Enable MCPWM carrier submodule, for respective timer.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

`esp_err_t mcpwm_carrier_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)`

Disable MCPWM carrier submodule, for respective timer.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

`esp_err_t mcpwm_carrier_set_period(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_period)`

Set period of carrier.

Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters
• `mcpwm_num`: set MCPWM unit(0-1)
• `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• `carrier_period`: set the carrier period of each timer, carrier period = (carrier_period + 1)*800ns
  (carrier_period <= 15)

```
esp_err_t mcpwm_carrier_set_duty_cycle(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_duty)
```

Set duty_cycle of carrier.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• `mcpwm_num`: set MCPWM unit(0-1)
• `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• `carrier_duty`: set duty_cycle of carrier, carrier duty cycle = carrier_duty*12.5% (chop_duty <= 7)

```
esp_err_t mcpwm_carrier_oneshot_mode_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t pulse_width)
```

Enable and set width of first pulse in carrier oneshot mode.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• `mcpwm_num`: set MCPWM unit(0-1)
• `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• `pulse_width`: set pulse width of first pulse in oneshot mode, width = (carrier period)*(pulse_width +1) (pulse_width <= 15)

```
esp_err_t mcpwm_carrier_oneshot_mode_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Disable oneshot mode, width of first pulse = carrier period.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• `mcpwm_num`: set MCPWM unit(0-1)
• `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```
esp_err_t mcpwm_carrier_output_invert(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_carrier_out_ivt_t carrier_ivt_mode)
```

Enable or disable carrier output inversion.
esp_err_t mcpwm_deadtime_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_deadtime_type_t dt_mode, uint32_t red, uint32_t fed)
Enable and initialize deadtime for each MCPWM timer.

esp_err_t mcpwm_deadtime_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
Disable deadtime on MCPWM timer.

esp_err_t mcpwm_fault_init(mcpwm_unit_t mcpwm_num, mcpwm_fault_input_level_t input_level, mcpwm_fault_signal_t fault_sig)
Initialize fault submodule, currently low level triggering is not supported.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• carrier_inv_mode: enable or disable carrier output inversion
• dt_mode: set deadtime mode
• red: set rising edge delay = \text{red}*100ns
• fed: set rising edge delay = \text{fed}*100ns
• input_level: set fault signal level, which will cause fault to occur
• fault_sig: set the fault pin, which needs to be enabled

```c
esp_err_t mcpwm_fault_set_oneshot_mode(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_fault_signal_t fault_sig, mcpwm_output_action_t action_on_pwmxa, mcpwm_output_action_t action_on_pwmxb)
```

Set oneshot mode on fault detection, once fault occur in oneshot mode reset is required to resume MCPWM signals.

**Note** currently low level triggering is not supported

**Return**

• ESP_OK Success

• ESP_ERR_INVALID_ARG Parameter error

**Parameters**

• mcpwm_num: set MCPWM unit(0-1)

• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

• fault_sig: set the fault pin, which needs to be enabled for oneshot mode

• action_on_pwmxa: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle

• action_on_pwmxb: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

```c
esp_err_t mcpwm_fault_set_cyc_mode(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_fault_signal_t fault_sig, mcpwm_output_action_t action_on_pwmxa, mcpwm_output_action_t action_on_pwmxb)
```

Set cycle-by-cycle mode on fault detection, once fault occur in cyc mode MCPWM signal resumes as soon as fault signal becomes inactive.

**Note** currently low level triggering is not supported

**Return**

• ESP_OK Success

• ESP_ERR_INVALID_ARG Parameter error

**Parameters**

• mcpwm_num: set MCPWM unit(0-1)

• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

• fault_sig: set the fault pin, which needs to be enabled for cyc mode

• action_on_pwmxa: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle

• action_on_pwmxb: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

```c
esp_err_t mcpwm_fault_deinit(mcpwm_unit_t mcpwm_num, mcpwm_fault_signal_t fault_sig)
```

Disable fault signal.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• fault_sig: fault pin, which needs to be disabled

```c
esp_err_t mcpwm_capture_enable(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig, mcpwm_capture_on_edge_t cap_edge, uint32_t num_of_pulse)
```
Initialize capture submodule.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• cap_edge: set capture edge, BIT(0) - negative edge, BIT(1) - positive edge
• cap_sig: capture pin, which needs to be enabled
• num_of_pulse: count time between rising/falling edge between 2 *(pulses mentioned), counter uses APB_CLK

```c
esp_err_t mcpwm_capture_disable(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)
```
Disable capture signal.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• cap_sig: capture pin, which needs to be disabled

```c
uint32_t mcpwmCaptureSignalGetValue(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)
```
Get capture value.

Return  Captured value

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• cap_sig: capture pin on which value is to be measured

```c
uint32_t mcpwmCaptureSignalGetEdge(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)
```
Get edge of capture signal.

Return  Capture signal edge: 1 - positive edge, 2 - negative edge
Parameters
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture pin of whose edge is to be determined

```c
esp_err_t mcpwm_sync_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_sync_signal_t sync_sig, uint32_t phase_val)
```
Initialize sync submodule.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `sync_sig`: set the synchronization pin, which needs to be enabled
- `phase_val`: phase value in 1/1000 (for 86.7%, phase_val = 867) which timer moves to on sync signal

```c
esp_err_t mcpwm_sync_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```
Disable sync submodule on given timer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_isr_register(mcpwm_unit_t mcpwm_num, void (*fn) void *, void *arg, int intr_alloc_flags, intr_handle_t *handle)
```
Register MCPWM interrupt handler, the handler is an ISR. the handler will be attached to the same CPU core that this function is running on.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

Parameters
- `mcpwm_num`: set MCPWM unit(0-1)
- `fn`: interrupt handler function.
- `arg`: user-supplied argument passed to the handler function.
- `intr_alloc_flags`: flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. see esp_intr_alloc.h for more info.
- `handle`: pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Enumerations

enum mcpwm_io_signals_t
  IO signals for the MCPWM.

  • 6 MCPWM output pins that generate PWM signals
  • 3 MCPWM fault input pins to detect faults like overcurrent, overvoltage, etc.
  • 3 MCPWM sync input pins to synchronize MCPWM outputs signals
  • 3 MCPWM capture input pins to gather feedback from controlled motors, using e.g. hall sensors

Values:

MCPWM0A = 0
  PWM0A output pin

MCPWM0B
  PWM0B output pin

MCPWM1A
  PWM1A output pin

MCPWM1B
  PWM1B output pin

MCPWM2A
  PWM2A output pin

MCPWM2B
  PWM2B output pin

MCPWM_SYNC_0
  SYNC0 input pin

MCPWM_SYNC_1
  SYNC1 input pin

MCPWM_SYNC_2
  SYNC2 input pin

MCPWM_FAULT_0
  FAULT0 input pin

MCPWM_FAULT_1
  FAULT1 input pin

MCPWM_FAULT_2
  FAULT2 input pin

MCPWM_CAP_0 = 84
  CAP0 input pin
enum mcpwm_unit_t
    Select MCPWM unit.
    Values:
    MCPWM_UNIT_0 = 0
        MCPWM unit0 selected
    MCPWM_UNIT_1
        MCPWM unit1 selected
    MCPWM_UNIT_MAX
        Num of MCPWM units on ESP32

enum mcpwm_timer_t
    Select MCPWM timer.
    Values:
    MCPWM_TIMER_0 = 0
        Select MCPWM timer0
    MCPWM_TIMER_1
        Select MCPWM timer1
    MCPWM_TIMER_2
        Select MCPWM timer2
    MCPWM_TIMER_MAX
        Num of MCPWM timers on ESP32

enum mcpwm_generator_t
    Select MCPWM operator.
    Values:
    MCPWM_GEN_A = 0
        Select MCPWMXA, where ‘X’ is operator number
    MCPWM_GEN_B
        Select MCPWMXB, where ‘X’ is operator number
    MCPWM_GEN_MAX
        Num of generators to each operator of MCPWM

enum mcpwm_carrier_os_t
    MCPWM carrier oneshot mode, in this mode the width of the first pulse of carrier can be programmed.
    Values:
    MCPWM_ONESHOT_MODE_DIS = 0
        Enable oneshot mode
    MCPWM_ONESHOT_MODE_EN
        Disable oneshot mode

enum mcpwm_carrier_out_ivt_t
    MCPWM carrier output inversion, high frequency carrier signal active with MCPWM signal is high.
Values:

`MCPWM_CARRIER_OUT_IVT_DIS = 0`
Enable carrier output inversion

`MCPWM_CARRIER_OUT_IVT_EN`
Disable carrier output inversion

```c
enum mcpwm_fault_signal_t
MCPWM select fault signal input.
```

Values:

`MCPWM_SELECT_F0 = 0`
Select F0 as input

`MCPWM_SELECT_F1`
Select F1 as input

`MCPWM_SELECT_F2`
Select F2 as input

```c
enum mcpwm_fault_input_level_t
MCPWM select triggering level of fault signal.
```

Values:

`MCPWM_LOW_LEVEL_TGR = 0`
Fault condition occurs when fault input signal goes from high to low, currently not supported

`MCPWM_HIGH_LEVEL_TGR`
Fault condition occurs when fault input signal goes low to high

```c
enum mcpwm_capture_signal_t
MCPWM select capture signal input.
```

Values:

`MCPWM_SELECT_CAP0 = 0`
Select CAP0 as input

`MCPWM_SELECT_CAP1`
Select CAP1 as input

`MCPWM_SELECT_CAP2`
Select CAP2 as input

### 2.3.9 Pulse Counter

**Introduction**

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of an input signal. Each pulse counter unit has a 16-bit signed counter register and two channels that can be configured to either increment or decrement the counter. Each channel has a signal input that accepts signal edges to be detected, as well as a control input that can be used to enable or disable the signal input. The inputs have optional filters that can be used to discard unwanted glitches in the signal.

**Functionality Overview**

Description of functionality of this API has been broken down into four sections:
- **Configuration** - describes counter’s configuration parameters and how to setup the counter.
- **Operating the Counter** - provides information on control functions to pause, measure and clear the counter.
- **Filtering Pulses** - describes options to filtering pulses and the counter control signals.
- **Using Interrupts** - presents how to trigger interrupts on specific states of the counter.

## Configuration

The PCNT module has eight independent counting “units” numbered from 0 to 7. In the API they are referred to using `pcnt_unit_t`. Each unit has two independent channels numbered as 0 and 1 and specified with `pcnt_channel_t`.

The configuration is provided separately per unit’s channel using `pcnt_config_t` and covers:

- The unit and the channel number this configuration refers to.
- GPIO numbers of the pulse input and the pulse gate input.
- Two pairs of parameters: `pcnt_ctrl_mode_t` and `pcnt_count_mode_t` to define how the counter reacts depending on the the status of control signal and how counting is done positive / negative edge of the pulses.
- Two limit values (minimum / maximum) that are used to establish watchpoints and trigger interrupts when the pulse count is meeting particular limit.

Setting up of particular channel is then done by calling a function `pcnt_unit_config()` with above `pcnt_config_t` as the input parameter.

To disable the pulse or the control input pin in configuration, provide `PCNT_PIN_NOT_USED` instead of the GPIO number.

## Operating the Counter

After doing setup with `pcnt_unit_config()`, the counter immediately starts to operate. The accumulated pulse count can be checked by calling `pcnt_get_counter_value()`.

There are couple of functions that allow to control the counter’s operation: `pcnt_counter_pause()`, `pcnt_counter_resume()` and `pcnt_counter_clear()`.

It is also possible to dynamically change the previously set up counter modes with `pcnt_unit_config()` by calling `pcnt_set_mode()`.

If desired, the pulse input pin and the control input pin may be changed “on the fly” using `pcnt_set_pin()`. To disable particular input provide as a function parameter `PCNT_PIN_NOT_USED` instead of the GPIO number.

**Note:** For the counter not to miss any pulses, the pulse duration should be longer than one APB_CLK cycle (12.5 ns). The pulses are sampled on the edges of the APB_CLK clock and may be missed, if fall between the edges. This applies to counter operation with or without a `filer`.

## Filtering Pulses

The PCNT unit features filters on each of the pulse and control inputs, adding the option to ignore short glitches in the signals.

---

2.3. Peripherals API
The length of ignored pulses is provided in APB_CLK clock cycles by calling `pcnt_set_filter_value()`. The current filter setting may be checked with `pcnt_get_filter_value()`. The APB_CLK clock is running at 80 MHz.

The filter is put into operation / suspended by calling `pcnt_filter_enable() / pcnt_filter_disable()`.

### Using Interrupts

There are five counter state watch events, defined in `pcnt_evt_type_t`, that are able to trigger an interrupt. The event happens on the pulse counter reaching specific values:

- Minimum or maximum count values: `counter_l_lim` or `counter_h_lim` provided in `pcnt_config_t` as discussed in `Configuration`
- Threshold 0 or Threshold 1 values set using function `pcnt_set_event_value()`.
- Pulse count = 0

To register, enable or disable an interrupt to service the above events, call `pcnt_isr_register()`, `pcnt_intr_enable()`, and `pcnt_intr_disable()`. To enable or disable events on reaching threshold values, you will also need to call functions `pcnt_event_enable()` and `pcnt_event_disable()`.

In order to check what are the threshold values currently set, use function `pcnt_get_event_value()`.

### Application Example

Pulse counter with control signal and event interrupt example: `peripherals/pcnt`.

### API Reference

#### Header File

- `driver/include/driver/pcnt.h`

#### Functions

```c
esp_err_t pcnt_unit_config(const pcnt_config_t *pcnt_config)

Configure Pulse Counter unit.
```

**Note** This function will disable three events: PCNT_EVT_L_LIM, PCNT_EVT_H_LIM, PCNT_EVT_ZERO.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver already initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `pcnt_config`: Pointer of Pulse Counter unit configure parameter

```c
esp_err_t pcnt_get_counter_value(pcnt_unit_t pcnt_unit, int16_t *count)

Get pulse counter value.
```

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• pcnt_unit: Pulse Counter unit number
• count: Pointer to accept counter value

`esp_err_t pcnt_counter_pause(pcnt_unit_t pcnt_unit)`
Pause PCNT counter of PCNT unit.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• pcnt_unit: PCNT unit number

`esp_err_t pcnt_counter_resume(pcnt_unit_t pcnt_unit)`
Resume counting for PCNT counter.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• pcnt_unit: PCNT unit number, select from pcnt_unit_t

`esp_err_t pcnt_counter_clear(pcnt_unit_t pcnt_unit)`
Clear and reset PCNT counter value to zero.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• pcnt_unit: PCNT unit number, select from pcnt_unit_t

`esp_err_t pcnt_intr_enable(pcnt_unit_t pcnt_unit)`
Enable PCNT interrupt for PCNT unit.

Note Each Pulse counter unit has five watch point events that share the same interrupt. Configure events with `pcnt_event_enable()` and `pcnt_event_disable()`

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• \textit{pcnt\_unit}: PCNT unit number

\texttt{esp\_err\_t pcnt\_intr\_disable (pcnt\_unit\_t pcnt\_unit)}

Disable PCNT interrupt for PCNT unit.

Return

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• \textit{pcnt\_unit}: PCNT unit number

\texttt{esp\_err\_t pcnt\_event\_enable (pcnt\_unit\_t unit, pcnt\_evt\_type\_t evt\_type)}

Enable PCNT event of PCNT unit.

Return

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• \textit{unit}: PCNT unit number
• \textit{evt\_type}: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

\texttt{esp\_err\_t pcnt\_event\_disable (pcnt\_unit\_t unit, pcnt\_evt\_type\_t evt\_type)}

Disable PCNT event of PCNT unit.

Return

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• \textit{unit}: PCNT unit number
• \textit{evt\_type}: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

\texttt{esp\_err\_t pcnt\_set\_event\_value (pcnt\_unit\_t unit, pcnt\_evt\_type\_t evt\_type, int16\_t value)}

Set PCNT event value of PCNT unit.
Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
- evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- value: Counter value for PCNT event

\[ \text{esp_err_t pcnt_get_event_value (pcnt_unit_t unit, pcnt_evt_type_t evt_type, int16_t *value)} \]

Get PCNT event value of PCNT unit.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
- evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- value: Pointer to accept counter value for PCNT event

\[ \text{esp_err_t pcnt_isr_register (void (*fn) void *, void *arg, int intr_alloc_flags, pcnt_isr_handle_t *handle)} \]

Register PCNT interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. Please do not use pcnt_isr_service_install if this function was called.

Return

- ESP_OK Success
- ESP_ERR_NOT_FOUND Can not find the interrupt that matches the flags.
- ESP_ERR.INVALID_ARG Function pointer error.

Parameters

- fn: Interrupt handler function.
- arg: Parameter for handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here. Calling esp_intr_free to unregister this ISR service if needed, but only if the handle is not NULL.

\[ \text{esp_err_t pcnt_set_pin (pcnt_unit_t unit, pcnt_channel_t channel, int pulse_io, int ctrl_io)} \]

Configure PCNT pulse signal input pin and control input pin.

2.3. Peripherals API
Note  Set the signal input to PCNT_PIN_NOT_USED if unused.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
- channel: PCNT channel number
- pulse_io: Pulse signal input GPIO
- ctrl_io: Control signal input GPIO

`esp_err_t pcnt_filter_enable (pcnt_unit_t unit)`

Enable PCNT input filter.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number

`esp_err_t pcnt_filter_disable (pcnt_unit_t unit)`

Disable PCNT input filter.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number

`esp_err_t pcnt_set_filter_value (pcnt_unit_t unit, uint16_t filter_val)`

Set PCNT filter value.

Note  filter_val is a 10-bit value, so the maximum filter_val should be limited to 1023.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
• **filter_val**: PCNT signal filter value, counter in APB_CLK cycles. Any pulses lasting shorter than this will be ignored when the filter is enabled.

```c
esp_err_t pcnt_get_filter_value (pcnt_unit_t unit, uint16_t *filter_val)
```

Get PCNT filter value.

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**

• **unit**: PCNT unit number
• **filter_val**: Pointer to accept PCNT filter value.

```c
esp_err_t pcnt_set_mode (pcnt_unit_t unit, pcnt_channel_t channel, pcnt_count_mode_t pos_mode, pcnt_count_mode_t neg_mode, pcnt_ctrl_mode_t hctrl_mode, pcnt_ctrl_mode_t lctrl_mode)
```

Set PCNT counter mode.

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**

• **unit**: PCNT unit number
• **channel**: PCNT channel number
• **pos_mode**: Counter mode when detecting positive edge
• **neg_mode**: Counter mode when detecting negative edge
• **hctrl_mode**: Counter mode when control signal is high level
• **lctrl_mode**: Counter mode when control signal is low level

```c
esp_err_t pcnt_isr_handler_add (pcnt_unit_t unit, void (*isr_handler) (void *, void *) args)
```

Add ISR handler for specified unit.

Call this function after using pcnt_isr_service_install() to install the PCNT driver’s ISR handler service.

The ISR handlers do not need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in pcnt_isr_service_install().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global PCNT interrupt handler due to the additional level of indirection.

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized

2.3. Peripherals API
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• unit: PCNT unit number
• isr_handler: Interrupt handler function.
• args: Parameter for handler function

def pcnt_isr_service_install(intr_alloc_flags)
Install PCNT ISR service.

Note: We can manage different interrupt service for each unit. This function will use the default ISR handle service. Calling pcnt_isr_service_uninstall to uninstall the default service if needed. Please do not use pcnt_isr_register if this function was called.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_NO_MEM No memory to install this service
• ESP_ERR_INVALID_STATE ISR service already installed

Parameters
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

def pcnt_isr_service_uninstall()
Uninstall PCNT ISR service, freeing related resources.

def pcnt_isr_handler_remove(unit)
Delete ISR handler for specified unit.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• unit: PCNT unit number

Type Definitions

typedef intr_handle_t pcnt_isr_handle_t

Header File
• soc/include/hal/pcnt_types.h
Structures

```c
struct pcnt_config_t
```

Pulse Counter configuration for a single channel.

**Public Members**

```c
int pulse_gpio_num
```

Pulse input GPIO number, if you want to use GPIO16, enter `pulse_gpio_num = 16`, a negative value will be ignored.

```c
int ctrl_gpio_num
```

Control signal input GPIO number, a negative value will be ignored.

```c
pcnt_ctrl_mode_t lctrl_mode
```

PCNT low control mode.

```c
pcnt_ctrl_mode_t hctrl_mode
```

PCNT high control mode.

```c
pcnt_count_mode_t pos_mode
```

PCNT positive edge count mode.

```c
pcnt_count_mode_t neg_mode
```

PCNT negative edge count mode.

```c
int16_t counter_h_lim
```

Maximum counter value.

```c
int16_t counter_l_lim
```

Minimum counter value.

```c
pcnt_unit_t unit
```

PCNT unit number.

```c
pcnt_channel_t channel
```

the PCNT channel.

**Type Definitions**

```c
typedef int pcnt_port_t
```

PCNT port number, the max port number is (PCNT_PORT_MAX - 1).

```c
typedef int pcnt_unit_t
```

Selection of all available PCNT units.

**Enumerations**

```c
enum pcnt_ctrl_mode_t
```

Selection of available modes that determine the counter’s action depending on the state of the control signal’s input GPIO.

**Note** Configuration covers two actions, one for high, and one for low level on the control input.

**Values:**
PCNT_MODE_KEEP = 0
Control mode: won’t change counter mode

PCNT_MODE.Reverse = 1
Control mode: invert counter mode(increase -> decrease, decrease -> increase)

PCNT_MODE_DISABLE = 2
Control mode: Inhibit counter(counter value will not change in this condition)

PCNT_MODE_MAX

enum pcnt_count_mode_t
Selection of available modes that determine the counter’s action on the edge of the pulse signal’s input GPIO.

Note Configuration covers two actions, one for positive, and one for negative edge on the pulse input

Values:

PCNT.COUNT_DIS = 0
Counter mode: Inhibit counter(counter value will not change in this condition)

PCNT.COUNT_INC = 1
Counter mode: Increase counter value

PCNT.COUNT_DEC = 2
Counter mode: Decrease counter value

PCNT.COUNT_MAX

enum pcnt_channel_t
Selection of channels available for a single PCNT unit.

Values:

PCNT_CHANNEL_0 = 0x00
PCNT channel 0

PCNT_CHANNEL_1 = 0x01
PCNT channel 1

PCNT_CHANNEL_MAX

enum pcnt_evt_type_t
Selection of counter’s events the may trigger an interrupt.

Values:

PCNT_EVT.THRES_1 = BIT(2)
PCNT watch point event: threshold1 value event

PCNT_EVT.THRES_0 = BIT(3)
PCNT watch point event: threshold0 value event

PCNT_EVT.L_LIM = BIT(4)
PCNT watch point event: Minimum counter value

PCNT_EVT.H_LIM = BIT(5)
PCNT watch point event: Maximum counter value

PCNT_EVT.ZERO = BIT(6)
PCNT watch point event: counter value zero event

PCNT_EVT_MAX
2.3.10 RMT

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to flexibility of RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by RMT’s transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.

![RMT Transmitter Overview](image)

Fig. 19: RMT Transmitter Overview

The reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

![RMT Receiver Overview](image)

Fig. 20: RMT Receiver Overview

There couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. Configure Driver
2. Transmit Data or Receive Data
3. Change Operation Parameters
4. Use Interrupts

The RMT has eight channels numbered from zero to seven. Each channel is able to independently transmit or receive data. They are referred to using indexes defined in structure `rmt_channel_t`.
Configure Driver

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of \texttt{rmt_config_t} structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

Common Parameters

- The \texttt{channel} to be configured, select one from the \texttt{rmt\_channel\_t} enumerator.
- The RMT \texttt{operation mode} - whether this channel is used to transmit or receive data, selected by setting a \texttt{rmt\_mode} members to one of the values from \texttt{rmt\_mode\_t}.
- What is the \texttt{pin number} to transmit or receive RMT signals, selected by setting \texttt{gpio\_num}.
- How many \texttt{memory blocks} will be used by the channel, set with \texttt{mem\_block\_num}.
- A \texttt{clock divider}, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting \texttt{clk\_div} to a value within $[1 .. 255]$ range. The RMT source clock is typically APB CLK, 80Mhz by default.

\textit{Note:} The period of a square wave after the clock divider is called a ‘tick’. The length of the pulses generated by the RMT transmitter or discriminated by the receiver is configured in number of ‘ticks’.

There are also couple of specific parameters that should be set up depending if selected channel is configured in \textit{Transmit Mode} or \textit{Receive Mode}:

Transmit Mode

When configuring channel in transmit mode, set \texttt{tx\_config} and the following members of \texttt{rmt\_tx\_config\_t}:

- Transmit the currently configured data items in a loop - \texttt{loop\_en}
- Enable the RMT carrier signal - \texttt{carrier\_en}
- Frequency of the carrier in Hz - \texttt{carrier\_freq\_hz}
- Duty cycle of the carrier signal in percent (%) - \texttt{carrier\_duty\_percent}
- Level of the RMT output, when the carrier is applied - \texttt{carrier\_level}
- Enable the RMT output if idle - \texttt{idle\_output\_en}
- Set the signal level on the RMT output if idle - \texttt{idle\_level}

Receive Mode

In receive mode, set \texttt{rx\_config} and the following members of \texttt{rmt\_rx\_config\_t}:

- Enable a filter on the input of the RMT receiver - \texttt{filter\_en}
- A threshold of the filter, set in the number of ticks - \texttt{filter\_ticks\_thresh}. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is $[0..255]$.
- A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - \texttt{idle\_threshold}. The receiver will ignore pulses longer than this setting.
Finalize Configuration

Once the `rmt_config_t` structure is populated with parameters, it should be then invoked with `rmt_config()` to make the configuration effective.

The last configuration step is installation of the driver in memory by calling `rmt_driver_install()`. If `rx_buf_size` parameter of this function is > 0, then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in Use Interrupts.

Now, depending on how the channel is configured, we are ready to either Transmit Data or Receive Data. This is described in next two sections.

Transmit Data

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an 'item', is provided in a structure `rmt_item32_t`, see `soc/esp32/include/soc/rmt_caps.h`. Each item consists of two pairs of two values. The first value in a pair describes the signal duration in ticks and is 15 bits long, the second provides the signal level (high or low) and is contained in a single bit. A block of couple of items and the structure of an item is presented below.

```
Fig. 21: Structure of RMT items (L - signal level)
```

For a simple example how to define a block of items see peripherals/rmt/morse_code.

The items are provided to the RMT controller by calling function `rmt_write_items()`. This function also automatically triggers start of transmission. It may be called to wait for transmission completion or exit just after transmission start. In such case you can wait for the transmission end by calling `rmt_wait_tx_done()`. This function does not limit the number of data items to transmit. It is using an interrupt to successively copy the new data chunks to RMT’s internal memory as previously provided data are sent out.

Another way to provide data for transmission is by calling `rmt_fill_tx_items()`. In this case transmission is not started automatically. To control the transmission process use `rmt_tx_start()` and `rmt_tx_stop()`. The number of items to sent is restricted by the size of memory blocks allocated in the RMT controller’s internal memory, see `rmt_set_mem_block_num()`.
Receive Data

Before starting the receiver we need some storage for incoming items. The RMT controller has 512 x 32-bits of internal RAM shared between all eight channels. In typical scenarios it is not enough as an ultimate storage for all incoming (and outgoing) items. Therefore this API supports retrieval of incoming items on the fly to save them in a ring buffer of a size defined by the user. The size is provided when calling `rmt_driver_install()` discussed above. To get a handle to this buffer call `rmt_get_ringbuf_handle()`.

With the above steps complete we can start the receiver by calling `rmt_rx_start()` and then move to checking what’s inside the buffer. To do so, you can use common FreeRTOS functions that interact with the ring buffer. Please see an example how to do it in `peripherals/rmt/ir_protocols`.

To stop the receiver, call `rmt_rx_stop()`.

Change Operation Parameters

Previously described function `rmt_config()` provides a convenient way to set several configuration parameters in one shot. This is usually done on application start. Then, when the application is running, the API provides an alternate way to update individual parameters by calling dedicated functions. Each function refers to the specific RMT channel provided as the first input parameter. Most of the functions have _get_ counterpart to read back the currently configured value.

Parameters Common to Transmit and Receive Mode

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_pin()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80Mhz - `rmt_set_source_clk()`

Transmit Mode Parameters

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`

Receive Mode Parameters

- The filter setting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
- Whether the transmitter or receiver is entitled to access RMT’s memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`. 
Use Interrupts

Registering of an interrupt handler for the RMT controller is done by calling rmt_isr_register().

Note: When calling rmt_driver_install() to use the system RMT driver, a default ISR is being installed. In such a case you cannot register a generic ISR handler with rmt_isr_register().

The RMT controller triggers interrupts on four specific events described below. To enable interrupts on these events, the following functions are provided:

• The RMT receiver has finished receiving a signal - rmt_set_rx_intr_en()
• The RMT transmitter has finished transmitting the signal - rmt_set_tx_intr_en()
• The number of events the transmitter has sent matches a threshold value rmt_set_tx_thr_intr_en()
• Ownership to the RMT memory block has been violated - rmt_set_err_intr_en()

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling rmt_set_intr_enable_mask() or rmt_clr_intr_enable_mask().

When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific bits described as RMT.int_clr.val.chN_event_name and defined as a volatile struct in soc/esp32/include/soc/rmt_struct.h, where N is the RMT channel number [0, 7] and the event_name is one of four events described above.

If you do not need an ISR anymore, you can deregister it by calling a function rmt_isr_deregister().

Uninstall Driver

If the RMT driver has been installed with rmt_driver_install() for some specific period of time and then not required, the driver may be removed to free allocated resources by calling rmt_driver_uninstall().

Application Examples

• A simple RMT TX example: peripherals/rmt/morse_code.
• Another RMT TX example, specific to drive a common RGB LED strip: peripherals/rmt/led_strip.
• NEC remote control TX and RX example: peripherals/rmt/ir_protocols.

API Reference

Header File

• driver/include/driver/rmt.h

Functions

esp_err_t rmt_set_clk_div(rmt_channel_t channel, uint8_t div_cnt)

Set RMT clock divider, channel clock is divided from source clock.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- div_cnt: RMT counter clock divider

```c
esp_err_t rmt_get_clk_div(rmt_channel_t channel, uint8_t *div_cnt)
```
Get RMT clock divider, channel clock is divided from source clock.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- div_cnt: pointer to accept RMT counter divider

```c
esp_err_t rmt_set_rx_idle_thresh(rmt_channel_t channel, uint16_t thresh)
```
Set RMT RX idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- thresh: RMT RX idle threshold

```c
esp_err_t rmt_get_rx_idle_thresh(rmt_channel_t channel, uint16_t *thresh)
```
Get RMT idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- thresh: pointer to accept RMT RX idle threshold value
esp_err_t rmt_set_mem_block_num(rmt_channel_t channel, uint8_t rmt_mem_num)
Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel n. The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel n is start_addr_CHn to end_addr_CHn, which are defined by: Memory block start address is RMT_CHANNEL_MEM(n) (in soc/rmt_reg.h), that is, start_addr_chn = RMT base address + 0x800 + 64 * n, and end_addr_chn = RMT base address + 0x800 + 64 * n + 64 * RMT_MEM_SIZE_CHn mod 512.

Note If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel. Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• rmt_mem_num: RMT RX memory block number, one block has 64 * 32 bits.

esp_err_t rmt_get_mem_block_num(rmt_channel_t channel, uint8_t *rmt_mem_num)
Get RMT memory block number.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• rmt_mem_num: Pointer to accept RMT RX memory block number

esp_err_t rmt_set_tx_carrier(rmt_channel_t channel, bool carrier_en, uint16_t high_level, uint16_t low_level, rmt_carrier_level_t carrier_level)
Configure RMT carrier for TX signal.

Set different values for carrier_high and carrier_low to set different frequency of carrier. The unit of carrier_high/low is the source clock tick, not the divided channel counter clock.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• carrier_en: Whether to enable output carrier.
• high_level: High level duration of carrier
• low_level: Low level duration of carrier.
carrier_level: Configure the way carrier wave is modulated for channel.
- 1'b1: transmit on low output level
- 1'b0: transmit on high output level

`esp_err_t rmt_set_mem_pd(rmt_channel_t channel, bool pd_en)`
Set RMT memory in low power mode.
Reduce power consumed by memory. 1: memory is in low power state.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- pd_en: RMT memory low power enable.

`esp_err_t rmt_get_mem_pd(rmt_channel_t channel, bool *pd_en)`
Get RMT memory low power mode.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- pd_en: Pointer to accept RMT memory low power mode.

`esp_err_t rmt_tx_start(rmt_channel_t channel, bool tx_idx_rst)`
Set RMT start sending data from memory.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- tx_idx_rst: Set true to reset memory index for TX. Otherwise, transmitter will continue sending from the last index in memory.

`esp_err_t rmt_tx_stop(rmt_channel_t channel)`
Set RMT stop sending.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
• channel: RMT channel

`esp_err_t rmt_rx_start(rmt_channel_t channel, bool rx_idx_rst)`
Set RMT start receiving data.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• rx_idx_rst: Set true to reset memory index for receiver. Otherwise, receiver will continue receiving data to the last index in memory.

`esp_err_t rmt_rx_stop(rmt_channel_t channel)`
Set RMT stop receiving data.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel

`esp_err_t rmt_memory_rw_rst(rmt_channel_t channel)`
Reset RMT TX/RX memory index.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel

`esp_err_t rmt_set_memory_owner(rmt_channel_t channel, rmt_mem_owner_t owner)`
Set RMT memory owner.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• owner: To set when the transmitter or receiver can process the memory of channel.

`esp_err_t rmt_get_memory_owner(rmt_channel_t channel, rmt_mem_owner_t *owner)`
Get RMT memory owner.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- `channel`: RMT channel
- `owner`: Pointer to get memory owner.

```c
esp_err_t rmt_set_tx_loop_mode(rmt_channel_t channel, bool loop_en)
```
Set RMT tx loop mode.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- `channel`: RMT channel
- `loop_en`: Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel over and over again in a loop.

```c
esp_err_t rmt_get_tx_loop_mode(rmt_channel_t channel, bool *loop_en)
```
Get RMT tx loop mode.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- `channel`: RMT channel
- `loop_en`: Pointer to accept RMT transmitter loop sending mode.

```c
esp_err_t rmt_set_rx_filter(rmt_channel_t channel, bool rx_filter_en, uint8_t thresh)
```
Set RMT RX filter.
In receive mode, channel will ignore input pulse when the pulse width is smaller than threshold. Counted in source clock, not divided counter clock.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- `channel`: RMT channel
- `rx_filter_en`: To enable RMT receiver filter.
- `thresh`: Threshold of pulse width for receiver.

```c
esp_err_t rmt_set_source_clk(rmt_channel_t channel, rmt_source_clk_t base_clk)
```
Set RMT source clock.

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- `channel`: RMT channel
- `base_clk`: To choose source clock for RMT module.

`esp_err_t rmt_get_source_clk(rmt_channel_t channel, rmt_source_clk_t *src_clk)`
Get RMT source clock.

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- `channel`: RMT channel
- `src_clk`: Pointer to accept source clock for RMT module.

`esp_err_t rmt_set_idle_level(rmt_channel_t channel, bool idle_out_en, rmt_idle_level_t level)`
Set RMT idle output level for transmitter.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- `channel`: RMT channel
- `idle_out_en`: To enable idle level output.
- `level`: To set the output signal’s level for channel in idle state.

`esp_err_t rmt_get_idle_level(rmt_channel_t channel, bool *idle_out_en, rmt_idle_level_t *level)`
Get RMT idle output level for transmitter.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- `channel`: RMT channel
• idle_out_en: Pointer to accept value of enable idle.
• level: Pointer to accept value of output signal’s level in idle state for specified channel.

```c
esp_err_t rmt_get_status (rmt_channel_t channel, uint32_t *status)
Get RMT status.
```

**Return**

• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**

• channel: RMT channel
• status: Pointer to accept channel status. Please refer to RMT_CHnSTATUS_REG(n=0~7) in rmt_reg.h for more details of each field.

```c
void rmt_set_intr_enable_mask (uint32_t mask)
Set mask value to RMT interrupt enable register.
```

**Parameters**

• mask: Bit mask to set to the register

```c
void rmt_clr_intr_enable_mask (uint32_t mask)
Clear mask value to RMT interrupt enable register.
```

**Parameters**

• mask: Bit mask to clear the register

```c
esp_err_t rmt_set_rx_intr_en (rmt_channel_t channel, bool en)
Set RMT RX interrupt enable.
```

**Return**

• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**

• channel: RMT channel
• en: enable or disable RX interrupt.

```c
esp_err_t rmt_set_err_intr_en (rmt_channel_t channel, bool en)
Set RMT RX error interrupt enable.
```

**Return**

• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**

• channel: RMT channel
• en: enable or disable RX err interrupt.
```c
esp_err_t rmt_set_tx_intr_en (rmt_channel_t channel, bool en)
Set RMT TX interrupt enable.

Return
  • ESP_ERR_INVALID_ARG Parameter error
  • ESP_OK Success

Parameters
  • channel: RMT channel
  • en: enable or disable TX interrupt.

esp_err_t rmt_set_tx_thr_intr_en (rmt_channel_t channel, bool en, uint16_t evt_thresh)
Set RMT TX threshold event interrupt enable.

An interrupt will be triggered when the number of transmitted items reaches the threshold value.

Return
  • ESP_ERR_INVALID_ARG Parameter error
  • ESP_OK Success

Parameters
  • channel: RMT channel
  • en: enable or disable TX event interrupt.
  • evt_thresh: RMT event interrupt threshold value

esp_err_t rmt_set_pin (rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num)
Set RMT pin.

Return
  • ESP_ERR_INVALID_ARG Parameter error
  • ESP_OK Success

Parameters
  • channel: RMT channel
  • mode: TX or RX mode for RMT
  • gpio_num: GPIO number to transmit or receive the signal.

esp_err_t rmt_config (const rmt_config_t *rmt_param)
Configure RMT parameters.

Return
  • ESP_ERR_INVALID_ARG Parameter error
  • ESP_OK Success

Parameters
  • rmt_param: RMT parameter struct
```
The handler will be attached to the same CPU core that this function is running on.

**Note** If you already called rmt_driver_install to use system RMT driver, please do not register ISR handler again.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.
- ESP_FAIL System driver installed, can not register ISR handler for RMT

**Parameters**
- **fn**: Interrupt handler function.
- **arg**: Parameter for the handler function
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle**: If non-zero, a handle to later clean up the ISR gets stored here.

**esp_err_t rmt_isr_deregister(rmt_isr_handle_t handle)**

Deregister previously registered RMT interrupt handler.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Handle invalid

**Parameters**
- **handle**: Handle obtained from rmt_isr_register

**esp_err_t rmt_fill_tx_items(rmt_channel_t channel, const rmt_item32_t *item, uint16_t item_num, uint16_t mem_offset)**

Fill memory data of channel with given RMT items.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- **channel**: RMT channel
- **item**: Pointer of items.
- **item_num**: RMT sending items number.
- **mem_offset**: Index offset of memory.

**esp_err_t rmt_driver_install(rmt_channel_t channel, size_t rx_buf_size, int intr_alloc_flags)**

Initialize RMT driver.

**Return**
• ESP_ERR_INVALID_STATE Driver is already installed, call rmt_driver_uninstall first.
• ESP_ERR_NO_MEM Memory allocation failure
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• rx_buf_size: Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
• intr_alloc_flags: Flags for the RMT driver interrupt handler. Pass 0 for default flags. See esp_intr_alloc.h for details. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.

```c
esp_err_t rmt_driver_uninstall(rmt_channel_t channel)
```
Uninstall RMT driver.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel

```c
esp_err_t rmt_get_channel_status(rmt_channel_status_result_t *channel_status)
```
Get the current status of eight channels.

Note Do not call this function if it is possible that rmt_driver_uninstall will be called at the same time.

Return
• ESP_ERR_INVALID_ARG Parameter is NULL
• ESP_OK Success

Parameters
• channel_status: store the current status of each channel

```c
esp_err_t rmt_get_counter_clock(rmt_channel_t channel, uint32_t *clock_hz)
```
Get speed of channel’s internal counter clock.

Return
• ESP_ERR_INVALID_ARG Parameter is NULL
• ESP_OK Success

Parameters
• channel: RMT channel
• clock_hz: counter clock speed, in hz
**esp_err_t** \texttt{rmt\_write\_items} (\texttt{rmt\_channel\_t} \texttt{channel}, \texttt{const} \texttt{rmt\_item32\_t \*rmt\_item}, \texttt{int} \texttt{item\_num}, \texttt{bool} \texttt{wait\_tx\_done})

RMT send waveform from rmt\_item array.

This API allows user to send waveform with any length.

**Note** This function will not copy data, instead, it will point to the original items, and send the waveform items. If wait\_tx\_done is set to true, this function will block and will not return until all items have been sent out. If wait\_tx\_done is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- rmt\_item: head point of RMT items array. If ESP\_INTR\_FLAG\_IRAM is used, please do not use the memory allocated from psram when calling rmt\_write\_items.
- item\_num: RMT data item number.
- wait\_tx\_done:
  - If set 1, it will block the task and wait for sending done.
  - If set 0, it will not wait and return immediately.

**esp_err_t** \texttt{rmt\_wait\_tx\_done} (\texttt{rmt\_channel\_t} \texttt{channel}, \texttt{TickType\_t} \texttt{wait\_time})

Wait RMT TX finished.

**Return**

- ESP\_OK RMT Tx done successfully
- ESP\_ERR\_TIMEOUT Exceeded the ‘wait\_time’ given
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

**Parameters**

- channel: RMT channel
- wait\_time: Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with ESP\_ERR\_TIMEOUT if TX is busy (polling).

**esp_err_t** \texttt{rmt\_get\_ringbuf\_handle} (\texttt{rmt\_channel\_t} \texttt{channel}, \texttt{RingbufHandle\_t \*buf\_handle})

Get ringbuffer from RMT.

Users can get the RMT RX ringbuffer handle, and process the RX data.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**
channel: RMT channel
buf_handle: Pointer to buffer handle to accept RX ringbuffer handle.

```c
esp_err_t rmt_translator_init(rmt_channel_t channel, sample_to_rmt_t fn)
```
Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, the user callback will be replaced by the later.

**Return**
- ESP_FAIL Init fail.
- ESP_OK Init success.

**Parameters**
- channel: RMT channel.
- fn: Point to the data conversion function.

```c
esp_err_t rmt_write_sample(rmt_channel_t channel, const uint8_t *src, size_t src_size, bool wait_tx_done)
```
Translate uint8_t type of data into rmt format and send it out. Requires rmt_translator_init to init the translator first.

**Return**
- ESP_FAIL Send fail
- ESP_OK Send success

**Parameters**
- channel: RMT channel.
- src: Pointer to the raw data.
- src_size: The size of the raw data.
- wait_tx_done: Set true to wait all data send done.

`rmt_tx_end_callback_t rmt_register_tx_end_callback(rmt_tx_end_fn_t function, void *arg)`
Registers a callback that will be called when transmission ends.

Called by rmt_driver_isr_default in interrupt context.

**Note** Requires rmt_driver_install to install the default ISR handler.

**Return** the previous callback settings (members will be set to NULL if there was none)

**Parameters**
- function: Function to be called from the default interrupt handler or NULL.
- arg: Argument which will be provided to the callback when it is called.

**Structures**

```c
struct rmt_tx_config_t
```
Data struct of RMT TX configure parameters.
Public Members

```c
uint32_t carrier_freq_hz
    RMT carrier frequency
```

```c
rmt_carrier_level_t carrier_level
    Level of the RMT output, when the carrier is applied
```

```c
rmt_idle_level_t idle_level
    RMT idle level
```

```c
uint8_t carrier_duty_percent
    RMT carrier duty (%)
```

```c
bool carrier_en
    RMT carrier enable
```

```c
bool loop_en
    Enable sending RMT items in a loop
```

```c
bool idle_output_en
    RMT idle level output enable
```

```c
struct rmt_rx_config_t
    Data struct of RMT RX configure parameters.
```

Public Members

```c
uint16_t idle_threshold
    RMT RX idle threshold
```

```c
uint8_t filter_ticks_thresh
    RMT filter tick number
```

```c
bool filter_en
    RMT receiver filter enable
```

```c
struct rmt_config_t
    Data struct of RMT configure parameters.
```

Public Members

```c
rmt_mode_t rmt_mode
    RMT mode: transmitter or receiver
```

```c
rmt_channel_t channel
    RMT channel
```

```c
gpio_num_t gpio_num
    RMT GPIO number
```

```c
uint8_t clk_div
    RMT channel counter divider
```

```c
uint8_t mem_block_num
    RMT memory block number
```

```c
rmt_tx_config_t tx_config
    RMT TX parameter
```
\texttt{rmt\_rx\_config\_t rx\_config}

RMT RX parameter

\textbf{struct rmt\_tx\_end\_callback\_t}

Structure encapsulating a RMT TX end callback.

\textbf{Public Members}

\textbf{rmt\_tx\_end\_fn\_t function}

Function which is called on RMT TX end

void *\textbf{arg}

Optional argument passed to function

\textbf{Macros}

\textbf{RMT\_MEM\_ITEM\_NUM}

Define memory space of each RMT channel (in words = 4 bytes)

\textbf{RMT\_DEFAULT\_CONFIG\_TX}(gpio, channel\_id)

Default configuration for Tx channel.

\textbf{RMT\_DEFAULT\_CONFIG\_RX}(gpio, channel\_id)

Default configuration for RX channel.

\textbf{Type Definitions}

\textbf{typedef intr\_handle\_t rmt\_isr\_handle\_t}

RMT interrupt handle.

\textbf{typedef void (*rmt\_tx\_end\_fn\_t)(rmt\_channel\_t channel, void *arg)}

Type of RMT Tx End callback function.

\textbf{typedef void (*sample\_to\_rmt\_t)(const void *src, rmt\_item32\_t *dest, size\_t src\_size, size\_t wanted\_num, size\_t \_translated\_size, size\_t \*item\_num)}

User callback function to convert uint8\_t type data to rmt format(rmt\_item32\_t).

This function may be called from an ISR, so, the code should be short and efficient.

\textbf{Note} In fact, item\_num should be a multiple of translated\_size, e.g. : When we convert each byte of uint8\_t type data to rmt format data, the relation between item\_num and translated\_size should be item\_num = translated\_size*8.

\textbf{Parameters}

\begin{itemize}
\item src: Pointer to the buffer storing the raw data that needs to be converted to rmt format.
\item dest: Pointer to the buffer storing the rmt format data.
\item src\_size: The raw data size.
\item wanted\_num: The number of rmt format data that wanted to get.
\item translated\_size: The size of the raw data that has been converted to rmt format, it should return 0 if no data is converted in user callback.
\item item\_num: The number of the rmt format data that actually converted to, it can be less than wanted\_num if there is not enough raw data, but cannot exceed wanted\_num. it should return 0 if no data was converted.
\end{itemize}
Header File

- soc/include/hal/rmt_types.h

Structures

struct rmt_channel_status_result_t

Data struct of RMT channel status.

Public Members

rmt_channel_status_t status[RMT_CHANNEL_MAX]

Store the current status of each channel

Type Definitions

typedef rmt_channel_id_t rmt_channel_t

RMT Channel Type.

Enumerations

enum rmt_mem_owner_t

RMT Internal Memory Owner.

Values:

RMT_MEM_OWNER_TX

RMT RX mode, RMT transmitter owns the memory block

RMT_MEM_OWNER_RX

RMT RX mode, RMT receiver owns the memory block

RMT_MEM_OWNER_MAX

enum rmt_source_clk_t

Clock Source of RMT Channel.

Values:

RMT_BASECLK_REF

RMT source clock system reference tick, 1MHz by default (not supported in this version)

RMT_BASECLK_APB

RMT source clock is APB CLK, 80Mhz by default

RMT_BASECLK_MAX

enum rmt_data_mode_t

RMT Data Mode.

Note We highly recommended to use MEM mode not FIFO mode since there will be some gotcha in FIFO mode.

Values:
RMT_DATA_MODE_FIFO
RMT_DATA_MODE_MEM
RMT_DATA_MODE_MAX

enum rmt_mode_t
RMT Channel Working Mode (TX or RX)

Values:

RMT_MODE_TX
RMT TX mode
RMT_MODE_RX
RMT RX mode
RMT_MODE_MAX

enum rmt_idle_level_t
RMT Idle Level.

Values:

RMT_IDLE_LEVEL_LOW
RMT TX idle level: low Level
RMT_IDLE_LEVEL_HIGH
RMT TX idle level: high Level
RMT_IDLE_LEVEL_MAX

enum rmt_carrier_level_t
RMT Carrier Level.

Values:

RMT_CARRIER_LEVEL_LOW
RMT carrier wave is modulated for low Level output
RMT_CARRIER_LEVEL_HIGH
RMT carrier wave is modulated for high Level output
RMT_CARRIER_LEVEL_MAX

enum rmt_channel_status_t
RMT Channel Status.

Values:

RMT_CHANNEL_UNINIT
RMT channel uninitialized
RMT_CHANNEL_IDLE
RMT channel status idle
RMT_CHANNEL_BUSY
RMT channel status busy

2.3.11 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products will need to be adjusted to provide the pull-ups required in the SD bus.
SD pull-up requirements apply to cases where ESP32 uses the SPI controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. Slaves should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent SD cards from entering a wrong state.

By default, the MTDI bootstrapping pin is incompatible with the DAT2 line pull-up if the flash voltage is 3.3 V. For more information, see MTDI Strapping Pin below.

This document has the following structure:

- **Overview of compatibility** between the default pull states on pins of Espressif’s products and the states required by the SD bus
- **Solutions** - ideas on how to resolve compatibility issues
- **Related information** - other relevant information

### Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

### Systems on a Chip (SoCs)

- ESP32 (except for D2WD versions, see ESP32 datasheet):
  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2* for models with 3.3 V flash chip
- ESP32-D2WD:
  - *No Pull-ups*
  - *No Pull-up on GPIO12*

### Systems in Packages (SIP)

- ESP32-PICO-D4:
  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2*

### Modules

  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2*
- ESP32-WROVER Series, including ESP32-WROVER and ESP32-WROVER-I
  - *No Pull-ups*
• ESP32-WROVER-B Series, including ESP32-WROVER-B and ESP32-WROVER-IB
  – No Pull-ups
  – Conflicts Between Bootstrap and SDIO on DAT2

**Development Boards**

• ESP32-PICO-KIT, including PICO-KIT v4.1, v4.0, and v3
  – No Pull-ups
  – Conflicts Between Bootstrap and SDIO on DAT2
  – Download Mode Not Working (minor issue)

• ESP32-DevKitC, including ESP32-DevKitC v4 and v2
  – No Pull-ups
  – Conflicts Between Bootstrap and SDIO on DAT2
  – Download Mode Not Working (minor issue)

• ESP-WROVER-KIT
  – Required pull-ups are provided
  – Pull-up Conflicts on GPIO13 (v4.1, v3, v2, and v1)
  – Conflicts Between Bootstrap and SDIO on DAT2 (v4.1, v2, and v1)
  – Download Mode Not Working (minor issue) (v2, v1)

You can determine the version of your ESP32-WROVER-KIT by checking which module is mounted on it:
  – ESP32-WROVER-B on v4.1
  – ESP32-WROVER on v3
  – ESP32-WROOM-32 on v1 and v2

• ESP32-LyraTD-MSC
  – Required pull-ups are provided
  – Conflicts Between Bootstrap and SDIO on DAT2

• ESP32-LyraT
  – Required pull-ups are provided
  – Pull-up Conflicts on GPIO13

**Non-Espressif Hosts**

Please make sure that your SDIO host provides necessary pull-ups for all SD bus signals.
Solutions

No Pull-ups

If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif’s development boards with pull-ups, go to Development Boards.
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

Pull-up Conflicts on GPIO13

If DAT3 of your device is not properly pulled up, you have the following options:

- Use 1-bit SD mode and tie the device’s DAT3 to VDD
- Use SPI mode

- Perform one of the following actions on the GPIO13 pin:
  - Remove the pull-down resistors
  - Attach a pull-up resistor of less than 5 kOhm (2 kOhm suggested)
  - Pull it up or drive it high either by using the host or with 3.3 V on VDD in 1-bit SD mode

Conflicts Between Bootstrap and SDIO on DAT2

There is a conflict between the boot strapping requirements of the ESP32 and the SDIO protocol. For details, see MTDI Strapping Pin.

To resolve the conflict, you have the following options:

1. (Recommended) Burn the flash voltage selection eFuses. This will permanently configure the internal regulator’s output voltage to 3.3 V, and GPIO12 will not be used as a bootstrapping pin. After that, connect a pull-up resistor to GPIO12.

   Warning: Burning eFuses is irreversible! The issue list above might be out of date, so please make sure that the module you are burning has a 3.3 V flash chip by checking the information on http://www.espressif.com/. If you burn the 3.3 V eFuses on a module with a 1.8 V flash chip, the module will stop functioning.

If you are sure that you need to irreversibly burn eFuses, go to your ESP-IDF directory and run the following command:

```
components/esptool_py/esptool/espefuse.py set_flash_voltage 3.3V
```

This command will burn the XPD_SDIO_TIEH, XPD_SDIO_FORCE, and XPD_SDIO_REG eFuses. After all the three eFuses are burned to value 1, the internal VDD_SDIO flash voltage regulator will be permanently set to 3.3 V. You will see the following log if the burning succeeds:

```
espefuse.py v2.6
Connecting....
Enable internal flash voltage regulator (VDD_SDIO) to 3.3 V.
```

(continues on next page)
The following eFuses are burned: XPD_SDIO_FORCE, XPD_SDIO_REG, XPD_SDIO_TIEH. This is an irreversible operation. Type 'BURN' (all capitals) to continue.

BURN
VDD_SDIO setting complete.

To check the status of the eFuses, run:
```
```
components/esptool_py/esptool/espefuse.py summary```

If running from an automated flashing script, espefuse.py has an option --do-not-confirm.

For more details, see the ESP32 Technical Reference Manual (PDF).

2. **If using 1-bit SD mode or SPI mode**, disconnect the DAT2 pin and make sure it is pulled high. For this, do one the following:

- Leave the host’s DAT2 floating and directly connect the slave’s DAT2 to VDD.
- For a slave device, build a firmware with the option `SDIO_SLAVE_FLAG_DAT2_DISABLED` and re-flash your device. This option will help avoid slave detecting on the DAT2 line. Note that 4-bit SD mode will no longer be supported by the standard Card Common Control Register (CCCR); however, the host will not be aware of that. The use of 4-bit SD mode will have to be disabled on the host’s side.

**No Pull-up on GPIO12**

Your module is compatible with the SDIO protocol. Just connect GPIO12 to VDD via a 10 kOhm resistor.

**Download Mode Not Working (minor issue)**

When the GPIO2 pin is pulled high in accordance with the SD pull-up requirements, you cannot enter Download mode because GPIO2 is a bootstrapping pin which in this case must be pulled low.

There are the following solutions:

- For boards that require shorting the GPIO0 and GPIO2 pins with a jumper, put the jumper in place, and the auto-reset circuit will pull GPIO2 low along with GPIO0 before entering Download mode.
- For boards with components attached to their GPIO2 pin (such as pull-down resistors and/or LEDs), check the schematic of your development board for anything connected to GPIO2.
  - **LEDs** would not affect operation in most cases.
  - **Pull-down resistors** can interfere with DAT0 signals and must be removed.

If the above solutions do not work for you, please determine if it is the host or slave device that has pull-ups affecting their GPIO2, then locate these pull-ups and remove them.

**Related Information**

**MTDI Strapping Pin**

MTDI (GPIO12) is used as a bootstrapping pin to select the output voltage of an internal regulator (VDD_SDIO) which powers the flash chip. This pin has an internal pull-down, so, if left unconnected, it will read low at startup, which will lead to selecting the default 3.3 V operation.
All ESP32-WROVER modules, excluding ESP32-WROVER-B, use 1.8 V flash and have internal pull-ups on GPIO12. Other modules that use 3.3 V flash have no pull-ups on the GPIO12 pin, and this pin is slightly pulled down internally.

When adding a pull-up to this pin for SD card operation, consider the following:

- For boards that do not use the internal regulator (VDD_SDIO) to power flash, GPIO12 can be pulled high.
- For boards using 1.8 V flash chips, GPIO12 needs to be pulled high at reset. This is fully compatible with the SD card operation.
- On boards using the internal regulator and a 3.3 V flash chip, GPIO12 must be pulled low at reset. This is incompatible with the SD card operation. For reference information on compatibility of Espressif’s boards with the SD card operation, see Overview of Compatibility.

Internal Pull-ups and Strapping Requirements

Using external resistors is always preferable. However, Espressif’s products have internal weak pull-up and pull-down resistors which can be enabled and used instead of external ones. Please keep in mind that this solution cannot guarantee reliable SDIO communication.

With that said, the information about these internal pull-ups and strapping requirements can still be useful. Espressif hardware products have different weak internal pull-ups / pull-downs connected to CMD and DATA pins. The table below shows the default pull-up and pull-down states of the CMD and DATA pins.

The following abbreviations are used in the table:

- WPU: Weak pull-up inside the SoC
- WPD: Weak pull-down inside the SoC
- PU: Pull-up inside Espressif modules but outside the SoC

2.3.12 SDMMC Host Driver

Overview

ESP32’s SDMMC host peripheral has two slots:

- Slot 0 (SDMMC_HOST_SLOT_0) is an 8-bit slot. It uses HS1_* signals in the PIN MUX.
- Slot 1 (SDMMC_HOST_SLOT_1) is a 4-bit slot. It uses HS2_* signals in the PIN MUX.

Pin mappings of these slots are given in the table below.
The Card Detect and Write Protect signals can be routed to arbitrary pins using the GPIO matrix. To reserve the pins, set the `gpio_cd` and `gpio_wp` members of the `sdmmc_slot_config_t` structure before calling `sdmmc_host_init_slot()`. Please note that it is not advised to specify a Card Detect pin when working with SDIO cards, because the card detect signal in ESP32 can also trigger SDIO slave interrupt.

**Warning:** Pins used by Slot 0 (`HS1_*`) are also used to connect the SPI flash chip in ESP32-WROOM and ESP32-WROVER modules. These pins cannot be shared between an SD card and SPI flash. If you need to use Slot 0, connect SPI flash to different pins and set eFuses accordingly.

### Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz), 4-line/1-line (with SD cards), and 8-line (with 3.3 V eMMC)
- High Speed (40 MHz), 4-line/1-line (with SD cards), and 8-line (with 3.3 V eMMC)
- High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)

Speed modes not supported at present:

- High Speed DDR mode, 8-line eMMC
- UHS-I 1.8 V modes, 4-line SD cards

### Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the `sdmmc_host_t` structure:

- `sdmmc_host_set_bus_width()`
- `sdmmc_host_set_card_clk()`
Configuring Bus Width and Frequency

With the default initializers for `sdmmc_host_t` and `sdmmc_slot_config_t` (*SDMMC_HOST_DEFAULT* and *SDMMC_SLOT_CONFIG_DEFAULT*), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```c
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```c
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

See also

See *SD/SDIO/MMC Driver* for the higher level driver which implements the protocol layer.

See *SD SPI Host Driver* for a similar driver which uses the SPI controller and is limited to SD protocol’s SPI mode.

See *SD Pull-up Requirements* for pullup support and compatibilities of modules and development kits.

API Reference

Header File

- `driver/include/driver/sdmmc_host.h`

Functions

```c
esp_err_t sdmmc_host_init (void)
Initialize SDMMC host peripheral.
```

- **Note** This function is not thread safe

  **Return**

  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if sdmmc_host_init was already called
  - ESP_ERR_NO_MEM if memory can not be allocated

```c
esp_err_t sdmmc_host_init_slot (int slot, const sdmmc_slot_config_t *slot_config)
Initialize given slot of SDMMC peripheral.
```

On the ESP32, SDMMC peripheral has two slots:

- Slot 0: 8-bit wide, maps to HS1_* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2_* signals in PIN MUX
Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if host has not been initialized using sdmmc_host_init

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `slot_config`: additional configuration for the slot

```c
esp_err_t sdmmc_host_set_bus_width(int slot, size_t width)
```
Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD_APP_SET_BUS_WIDTH)

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if slot number or width is not valid

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `width`: bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

```c
size_t sdmmc_host_get_slot_width(int slot)
```
Get bus width configured in sdmmc_host_init_slot to be used for data transfer.

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

```c
esp_err_t sdmmc_host_set_card_clk(int slot, uint32_t freq_khz)
```
Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- other error codes may be returned in the future

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `freq_khz`: card clock frequency, in kHz
**esp_err_t** sdmmc_host_set_bus_ddr_mode(int slot, bool ddr_enabled)

Enable or disable DDR mode of SD interface.

**Return**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if DDR mode is not supported on this slot

**Parameters**

- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **ddr_enabled**: enable or disable DDR mode

**esp_err_t** sdmmc_host_do_transaction(int slot, sdmmc_command_t *cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdmmc_host_do_transaction as long as other sdmmc_host_* functions are not called.

**Attention** Data buffer passed in cmdinfo->data must be in DMA capable memory

**Return**

- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response
- ESP_ERR_INVALID_SIZE if the size of data transfer is not valid in SD protocol
- ESP_ERR_INVALID_ARG if the data buffer is not in DMA capable memory

**Parameters**

- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **cmdinfo**: pointer to structure describing command and data to transfer

**esp_err_t** sdmmc_host_io_int_enable(int slot)

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

**Return** returns ESP_OK, other errors possible in the future

**Parameters**

- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

**esp_err_t** sdmmc_host_io_int_wait(int slot, TickType_t timeout_ticks)

Block until an SDIO interrupt is received, or timeout occurs.

**Return**

- ESP_OK on success (interrupt received)
- ESP_ERR_TIMEOUT if the interrupt did not occur within timeout_ticks
Parameters

- slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- timeout_ticks: number of RTOS ticks to wait for the interrupt

```c
esp_err_t sdmmc_host_deinit(void)
```
Disable SDMMC host and release allocated resources.

**Note** This function is not thread safe

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init function has not been called

```c
esp_err_t sdmmc_host_pullup_en(int slot, int width)
```
Enable the pull-ups of sd pins.

**Note** You should always place actual pullups on the lines instead of using this function. Internal pullup resistance are high and not sufficient, may cause instability in products. This is for debug or examples only.

**Return**

- ESP_OK: if success
- ESP_ERR_INVALID_ARG: if configured width larger than maximum the slot can support

**Parameters**

- slot: Slot to use, normally set it to 1.
- width: Bit width of your configuration, 1 or 4.

**Structures**

```c
struct sdmmc_slot_config_t
```
Extra configuration for SDMMC peripheral slot

**Public Members**

```c
gpio_num_t gpio_cd
```
GPIO number of card detect signal.

```c
gpio_num_t gpio_wp
```
GPIO number of write protect signal.

```c
uint8_t width
```
Bus width used by the slot (might be less than the max width supported)

```c
uint32_t flags
```
Features used by this slot.
Macros

`SDMMC_HOST_SLOT_0`
SDMMC slot 0.

`SDMMC_HOST_SLOT_1`
SDMMC slot 1.

`SDMMC_HOST_DEFAULT` ()
Default `sdmmc_host_t` structure initializer for SDMMC peripheral.
Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz

`SDMMC_SLOT_FLAG_INTERNAL_PULLUP`
Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

`SDMMC_SLOT_NO_CD`
indicates that card detect line is not used

`SDMMC_SLOT_NO_WP`
indicates that write protect line is not used

`SDMMC_SLOT_WIDTH_DEFAULT`
use the default width for the slot (8 for slot 0, 4 for slot 1)

`SDMMC_SLOT_CONFIG_DEFAULT` ()
Macro defining default configuration of SDMMC host slot

2.3.13 SD SPI Host Driver

Overview

The SD SPI host driver allows using the SPI2 (HSPI) or SPI3 (VSPI) controller for communication with SD cards. This driver’s naming pattern was adopted from the SDMMC Host driver due to their similarity. Likewise, the APIs of both drivers are also very similar.

The SD SPI host driver has the following modes:

- **SPI mode**: offers lower throughput but makes pin selection more flexible. With the help of the GPIO matrix, an SPI peripheral’s signals can be routed to any ESP32 pin.
- **1-bit SD mode**: offers higher throughput but requires routing the signals through their dedicated IO_MUX pins only.

The SD SPI driver uses software-controlled CS signal.

Currently, the SD SPI driver cannot handle multi-threaded environments as does not support time-division multiplexing on the same SPI bus. It means that if your application needs to communicate with an SD card and other devices on the same SPI bus, the application itself must ensure that its different tasks do not try to access the SPI slaves at the same time.

How to Use

The state and configurations of the SD SPI host driver are stored in a `sdmmc_host_t` structure. This structure can be initialized using the `SDSPI_HOST_DEFAULT` macro.
The state and configurations of the SD slot are stored in a `sdmmc_slot_config_t` structure. Use the macro `SDSPI_SLOT_CONFIG_DEFAULT` to initialize the structure and to fill in the default pin mappings (SD mode pin mappings).

Only the following driver’s API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_slot()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see the **SD/SDIO/MMC Driver**.

**Note:** SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

### API Reference

**Header File**

- `driver/include/driver/sdspi_host.h`

**Functions**

```c
esp_err_t sdspi_host_init(void)
```

Initialize SD SPI driver.

**Note** This function is not thread safe

**Return**

- ESP_OK on success
- other error codes may be returned in future versions

```c
esp_err_t sdspi_host_init_slot(int slot, const sdspi_slot_config_t *slot_config)
```

Initialize SD SPI driver for the specific SPI controller.

**Note** This function is not thread safe

**Note** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `sdspi_init_slot` has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

**Parameters**

- `slot`: SPI controller to use (HSPI_HOST or VSPI_HOST)
- `slot_config`: pointer to slot configuration structure
**esp_err_t sdspi_host_do_transaction**(int slot, sdmmc_command_t *cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdspi_host_do_transaction as long as other sdspi_host_* functions are not called.

**Return**
- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

**Parameters**
- **slot**: SPI controller (HSPI_HOST or VSPI_HOST)
- **cmdinfo**: pointer to structure describing command and data to transfer

**esp_err_t sdspi_host_set_card_clk**(int slot, uint32_t freq_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- other error codes may be returned in the future

**Parameters**
- **slot**: SPI controller (HSPI_HOST or VSPI_HOST)
- **freq_khz**: card clock frequency, in kHz

**esp_err_t sdspi_host_deinit**(void)

Release resources allocated using sdspi_host_init.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

**esp_err_t sdspi_host_io_int_enable**(int slot)

Enable SDIO interrupt.

**Return**
- ESP_OK on success

**Parameters**
• slot: SPI controller to use (HSPI_HOST or VSPI_HOST)

```c
esp_err_t sdspi_host_io_int_wait(int slot, TickType_t timeout_ticks)
```
Wait for SDIO interrupt until timeout.

**Return**

• ESP_OK on success

**Parameters**

• slot: SPI controller to use (HSPI_HOST or VSPI_HOST)
• timeout_ticks: Ticks to wait before timeout.

**Structures**

```c
struct sdspi_slot_config_t
  Extra configuration for SPI host
```

**Public Members**

- `gpio_num_t gpio_miso`
  GPIO number of MISO signal.
- `gpio_num_t gpio_mosi`
  GPIO number of MOSI signal.
- `gpio_num_t gpio_sck`
  GPIO number of SCK signal.
- `gpio_num_t gpio_cs`
  GPIO number of CS signal.
- `gpio_num_t gpio_cd`
  GPIO number of card detect signal.
- `gpio_num_t gpio_wp`
  GPIO number of write protect signal.
- `gpio_num_t gpio_int`
  GPIO number of interrupt line (input) for SDIO card.

```c
int dma_channel
  DMA channel to be used by SPI driver (1 or 2)
```

**Macros**

`SDSPI_HOST_DEFAULT()`
Default `sdmmc_host_t` structure initializer for SD over SPI driver.
Uses SPI mode and max frequency set to 20MHz
‘slot’ can be set to one of HSPI_HOST, VSPI_HOST.

`SDSPI_SLOT_NO_CD`
indicates that card detect line is not used
SDSPI_SLOT_NO_WP
indicates that write protect line is not used

SDSPI_SLOT_NO_INT
indicates that interrupt line is not used

SDSPI_SLOT_CONFIG_DEFAULT(
Macro defining default configuration of SPI host

## 2.3.14 SDIO Card Slave Driver

### Overview

The ESP32 SDIO Card peripherals (Host, Slave) shares two sets of pins as below table. The first set is usually occupied by SPI0 bus which is responsible for the SPI flash holding the code to run. This means SDIO slave driver can only runs on the second set of pins while SDIO host is not using it.

The SDIO slave can run under 3 modes: SPI, 1-bit SD and 4-bit SD modes, which is detected automatically by the hardware. According to the SDIO specification, CMD and DAT0-3 lines should be pulled up no matter in 1-bit, 4-bit or SPI mode.

### Connections

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>Corresponding pins in SPI mode</th>
<th>Slot1</th>
<th>Slot2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLK</td>
<td>SCLK</td>
<td>6</td>
<td>14</td>
</tr>
<tr>
<td>CMD</td>
<td>MOSI</td>
<td>11</td>
<td>15</td>
</tr>
<tr>
<td>DAT0</td>
<td>MISO</td>
<td>7</td>
<td>2</td>
</tr>
<tr>
<td>DAT1</td>
<td>Interrupt</td>
<td>8</td>
<td>4</td>
</tr>
<tr>

<td>N.C. (pullup)</td>
<td>9</td>
<td>12</td>
</tr>
<tr>
<td>DAT3</td>
<td>#CS</td>
<td>10</td>
<td>13</td>
</tr>
</tbody>
</table>

- 1-bit SD mode: Connect CLK, CMD, DAT0, DAT1 pins and the ground.
- 4-bit SD mode: Connect all pins and the ground.
- SPI mode: Connect SCLK, MOSI, MISO, Interrupt, #CS pins and the ground.

**Note:** Please check if CMD and DATA lines D0-D3 of the card are properly pulled up by 10 KOhm resistors. This should be ensured even in 1-bit mode or SPI mode. Most official modules don’t offer these pullups internally. If you are using official development boards, check *Overview of Compatibility* to see whether your development boards have such pullups.

**Note:** Most official modules have conflicts on strapping pins with the SDIO slave function. If you are using a ESP32 module with 3.3 V flash inside, you have to burn the EFUSE when you are developing on the module for the first time. See *Overview of Compatibility* to see how to make your modules compatible with the SDIO.

Here is a list for modules/kits with 3.3 V flash:
• Kits: ESP32-PICO-KIT, ESP32-DevKitC (till v4), ESP32-WROVER-KIT (v4.1 (also known as ESP32-WROVER-KIT-VB), v2, v1 (also known as DevKitJ v1))

You can tell the version of your ESP32-WROVER-KIT version from the module on it: v4.1 are with ESP32-WROVER-B modules, v3 are with ESP32-WROVER modules, while v2 and v1 are with ESP32-WROOM-32 modules.

Refer to SD Pull-up Requirements for more technical details of the pullups.

The host initialize the slave into SD mode by first sending CMD0 with DAT3 pin high, or in SPI mode by sending CMD0 with CS pin (the same pin as DAT3) low.

After the initialization, the host can enable the 4-bit SD mode by writing CCCR register 0x07 by CMD52. All the bus detection process are handled by the slave peripheral.

The host has to communicate with the slave by an ESP-slave-specific protocol. The slave driver offers 3 services over Function 1 access by CMD52 and CMD53: (1) a sending FIFO and a receiving FIFO, (2) 52 8-bit R/W registers shared by host and slave, (3) 16 interrupt sources (8 from host to slave, and 8 from slave to host).

**Terminology**

The SDIO slave driver uses the following terms:

- Transfer: a transfer is always started by a command token from the host, and may contain a reply and several data blocks. ESP32 slave software is based on transfers.
- Sending: slave to host transfers.
- Receiving: host to slave transfers.

**Note:** Register names in ESP Rechnical Reference Manual are oriented from the point of view of the host, i.e. ‘rx’ registers refer to sending, while ‘tx’ registers refer to receiving. We’re not using tx or rx in the driver to avoid ambiguities.

- FIFO: specific address in Function 1 that can be access by CMD53 to read/write large amount of data. The address is related to the length requested to read from/write to the slave in a single transfer: \( \text{requested length} = 0x1F800 - \text{address} \).
- Ownership: When the driver takes ownership of a buffer, it means the driver can randomly read/write the buffer (usually via DMA). The application should not read/write the buffer until the ownership is returned to the application. If the application reads from a buffer owned by a receiving driver, the data read can be random; if the application writes to a buffer owned by a sending driver, the data sent may be corrupted.
- Requested length: The length requested in one transfer determined by the FIFO address.
- Transfer length: The length requested in one transfer determined by the CMD53 byte/block count field.

**Note:** Requested length is different from the transfer length. ESP32 slave DMA base on the requested length rather than the transfer length. The transfer length should be no shorter than the requested length, and the rest part will be filled with 0 (sending) or discard (receiving).

- Receiving buffer size: The buffer size is pre-defined between the host and the slave before communication starts. Slave application has to set the buffer size during initialization by the \text{recv_buffer_size} member of \text{sdio_slave_config_t}.
• Interrupts: the esp32 slave support interrupts in two directions: from host to slave (called slave interrupts below) and from slave to host (called host interrupts below). See more in "Interrupts".

• Registers: specific address in Function 1 access by CMD52 or CMD53.

Communication with ESP SDIO Slave

The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of SDIO Simplified Specification), which is described briefly in "ESP SDIO slave initialization".

Furthermore, there’s an ESP32-specific upper-level communication protocol upon the CMD52/CMD53 to Func 1. Please refer to "ESP SDIO slave protocol". There is also a component "ESP Serial Slave Link" for ESP32 master to communicate with ESP32 SDIO slave, see example peripherals/sdio when programming your host.

Communication with ESP SDIO Slave

ESP SDIO slave initialization

The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of SDIO Simplified Specification). In this specification and below, the SDIO slave is also called an (SD)IO card. All the initialization CMD52 and CMD53 are sent to Func 0 (CIA region). Here is an brief example on how to do this:

1. SDIO reset CMD52 (Write 0x6=0x8)
2. SD reset CMD0
3. Check whether IO card (optional) CMD8
4. Send SDIO op cond and wait for card ready CMD5 arg = 0x00000000
   CMD5 arg = 0x00ff8000 (according to the response above, poll until ready)
   **Example:** Arg of R4 after first CMD5 (arg=0x00000000) is 0xXXFFFF00.
   Keep sending CMD5 with arg=0x00FFFF00 until the R4 shows card ready (arg bit 31=1).
5. Set address CMD3
6. Select card CMD7 (arg address according to CMD3 response)
   **Example:** Arg of R6 after CMD3 is 0x0001xxxx.
   Arg of CMD7 should be 0x00010000.
7. Select 4-bit mode (optional) CMD52 (Write 0x07=0x02)
8. Enable func1 CMD52 (Write 0x02=0x02)
9. Enable SDIO interrupt (required if interrupt line (DAT1) is used) CMD52 (Write 0x04=0x03)
10. Set Func0 blocksize (optional, default value is 512 (0x200)) CMD52/53 (Read 0x10~0x11)
    CMD52/53 (Write 0x10=0x00)
    CMD52/53 (Write 0x11=0x02)
    CMD52/53 (Read 0x10~0x11, read to check the final value)
11. Set Func1 blocksize (optional, default value is 512 (0x200)) CMD52/53 (Read 0x110~0x111)
    CMD52/53 (Write 0x110=0x00)
    CMD52/53 (Write 0x111=0x02)
CMD52/53 (Read 0x110~0x111, read to check the final value)

ESP SDIO slave protocol

The protocol is based on Function 1 access by CMD52 and CMD53, offering 3 services: (1) sending and receiving FIFO, (2) 52 8-bit R/W register shared by host and slave, (3) 8 general purpose interrupt sources from host to slave and 8 in the opposite direction.

There is a component esp_serial_slave_link implementing the logic of this protocol for ESP32 master to communicate with the ESP32 slave. See ESP Serial Slave Link.

The host should access the registers below as described to communicate with slave.

Slave register table

32-bit

- 0x044 (TOKEN_RDATA): in which bit 27-16 holds the receiving buffer number.
- 0x058 (INT_ST): holds the interrupt source bits from slave to host.
- 0x060 (PKT_LEN): holds the accumulated length (by byte) to be sent from slave to host.
- 0x0D4 (INT_CLR): write 1 to clear interrupt bits corresponding to INT_ST.
- 0x0DC (INT_ENA): mask bits for interrupts from slave to host.

8-bit

Shared general purpose registers:

- 0x06C-0x077: R/W registers 0-11 shared by slave and host.
- 0x07A-0x07B: R/W registers 14-15 shared by slave and host.
- 0x07E-0x07F: R/W registers 18-19 shared by slave and host.
- 0x088-0x08B: R/W registers 24-27 shared by slave and host.
- 0x09C-0x0BB: R/W registers 32-63 shared by slave and host.

Interrupt Registers: - 0x08D (SLAVE_INT): bits for host to interrupt slave. auto clear.

FIFO (sending and receiving)

0x090 - 0x1F7FF are reserved for FIFOs.

The address of CMD53 is related to the length requested to read from/write to the slave in a single transfer:

\[
\text{requested length} = 0x1F800-\text{address}
\]

The slave will respond with the length according to the length field in CMD53, with the data longer than requested length filled with 0 (sending) or discard (receiving).

Note: This includes both the block and the byte mode of CMD53.

The function number should be set to 1, OP Code should be set to 1 (for CMD53).
It is allowed to use CMD53 mode combination of block+byte to get higher efficiency when accessing the FIFO by arbitrary length. E.g. The block size is set to 512 by default, you can write/get 1031 bytes of data to/from the FIFO by:

1. Send CMD53 in block mode, block count=2 (1024 bytes) to address 0x1F3F9=0x1F800-1031.
2. Then send CMD53 in byte mode, byte count=8 (or 7 if your controller supports that) to address 0x1F7F9=0x1F800-7.

Interrupts

For the host interrupts, the slave raise the interrupt by pulling DAT1 line down at a proper time (level sensitive). The host detect this and read the INT_ST register to see the source. Then the host can clear it by writing the INT_CLR register and do something with the interrupt. The host can also mask unneeded sources by clearing the bits in INT_ENA register corresponding to the sources. If all the sources are cleared (or masked), the DAT1 line goes inactive.

ddio_slave_hostint_t (SDIO Card Slave Driver) shows the bit definition corresponding to host interrupt sources.

For the slave interrupts, the host send transfers to write the SLAVE_INT register. Once a bit is written from 0 to 1, the slave hardware and driver will detect it and inform the app.

Receiving FIFO

To write the receiving FIFO in the slave, host should work in the following steps:

1. Read the TOKEN1 field (bits 27-16) of TOKEN_RDATA (0x044) register. The buffer number remaining is TOKEN1 minus the number of buffers used by host.
2. Make sure the buffer number is sufficient (recv_buffer_size * buffer_num is greater than data to write, recv_buffer_size is pre-defined between the host and the slave before the communication starts). Or go back to step 1 until the buffer is enough.
3. Write to the FIFO address with CMD53. Note that the requested length should not be larger than calculated in step 2, and the FIFO address is related to requested length.
4. Calculate used buffers, note that non-full buffer at the tail should be seen as one that is used.

Sending FIFO

To read the sending FIFO in the slave, host should work in the following steps:

1. Wait for the interrupt line to be active (optional, low by default).
2. Read (poll) the interrupt bits in INT_ST register to see whether new packets exists.
3. If new packets are ready, reads the PKT_LEN reg. The data length to read from slave is PKT_LEN minus the length that has been read from the host. If the PKT_LEN is not larger than used, wait and poll until the slave is ready and update the PKT_LEN.
4. Read from the FIFO with CMD53. Note that the requested length should not be larger than calculated in step3, and the FIFO address is related to requested length.
5. Record read length.
Interrupts

There are interrupts from host to slave, and from slave to host to help communicating conveniently.

Slave Interrupts

The host can interrupt the slave by writing any one bit in the register 0x08D. Once any bit of the register is set, an interrupt is raised and the SDIO slave driver calls the callback function defined in the slave_intr_cb member in the sdio_slave_config_t structure.

**Note:** The callback function is called in the ISR, do not use any delay, loop or spinlock in the callback.

There’s another set of functions can be used. You can call sdio_slave_wait_int to wait for an interrupt within a certain time, or call sdio_slave_clear_int to clear interrupts from host. The callback function can work with the wait functions perfectly.

Host Interrupts

The slave can interrupt the host by an interrupt line (at certain time) which is level sensitive. When the host see the interrupt line pulled down, it may read the slave interrupt status register, to see the interrupt source. Host can clear interrupt bits, or choose to disable a interrupt source. The interrupt line will hold active until all the sources are cleared or disabled.

There are several dedicated interrupt sources as well as general purpose sources. see sdio_slave_hostint_t for more information.

Shared Registers

There are 52 8-bit R/W shared registers to share information between host and slave. The slave can write or read the registers at any time by sdio_slave_read_reg and sdio_slave_write_reg. The host can access (R/W) the register by CMD52 or CMD53.

Receiving FIFO

When the host is going to send the slave some packets, it has to check whether the slave is ready to receive by reading the buffer number of slave.

To allow the host sending data to the slave, the application has to load buffers to the slave driver by the following steps:

1. Register the buffer by calling sdio_slave_recv_register_buf, and get the handle of the registered buffer. The driver will allocate memory for the linked-list descriptor needed to link the buffer onto the hardware.
2. Load buffers onto the driver by passing the buffer handle to sdio_slave_recv_load_buf.
3. Call sdio_slave_recv to get the received data. If non-blocking call is needed, set wait=0.
4. Pass the handle of processed buffer back to the driver by sdio_recv_load_buf again.

**Note:** To avoid overhead from copying data, the driver itself doesn’t have any buffer inside, the application is responsible to offer new buffers in time. The DMA will automatically store received data to the buffer.
Sending FIFO

Each time the slave has data to send, it raises an interrupt and the host will request for the packet length. There are two sending modes:

- **Stream Mode**: when a buffer is loaded to the driver, the buffer length will be counted into the packet length requested by host in the incoming communications. Regardless previous packets are sent or not. This means the host can get data of several buffers in one transfer.

- **Packet Mode**: the packet length is updated packet by packet, and only when previous packet is sent. This means that the host can only get data of one buffer in one transfer.

**Note:** To avoid overhead from copying data, the driver itself doesn’t have any buffer inside. Namely, the DMA takes data directly from the buffer provided by the application. The application should not touch the buffer until the sending is finished.

The sending mode can be set in the `sending_mode` member of `sdio_slave_config_t`, and the buffer numbers can be set in the `send_queue_size`. All the buffers are restricted to be no larger than 4092 bytes. Though in the stream mode several buffers can be sent in one transfer, each buffer is still counted as one in the queue.

The application can call `sdio_slave_transmit` to send packets. In this case the function returns when the transfer is successfully done, so the queue is not fully used. When higher efficiency is required, the application can use the following functions instead:

1. Pass buffer information (address, length, as well as an arg indicating the buffer) to `sdio_slave_send_queue`. If non-blocking call is needed, set `wait=0`. If the `wait` is not `portMAX_DELAY` (wait until success), application has to check the result to know whether the data is put in to the queue or discard.

2. Call `sdio_slave_send_get_finished` to get and deal with a finished transfer. A buffer should be keep unmodified until returned from `sdio_slave_send_get_finished`. This means the buffer is actually sent to the host, rather than just staying in the queue.

There are several ways to use the `arg` in the queue parameter:

1. Directly point `arg` to a dynamic-allocated buffer, and use the `arg` to free it when transfer finished.

2. Wrap transfer informations in a transfer structure, and point `arg` to the structure. You can use the structure to do more things like:

```c
typedef struct {
    uint8_t* buffer;
    size_t size;
    int id;
}sdio_transfer_t;

// and send as:
sdio_transfer_t trans = {
    .buffer = ADDRESS_TO_SEND,
    .size = 8,
    .id = 3,  //the 3rd transfer so far
};
sdio_slave_send_queue(trans.buffer, trans.size, &trans, portMAX_DELAY);

//... maybe more transfers are sent here

// and deal with finished transfer as:
```
sdio_transfer_t* arg = NULL;
sdio_slave_send_get_finished((void**)&arg, portMAX_DELAY);
ESP_LOGI("tag", "%d successfully send %d bytes of %p", arg->id, arg->size, arg->
buffer);
some_post_callback(arg); //do more things

3. Working with the receiving part of this driver, point arg to the receive buffer handle of this buffer. So that we
can directly use the buffer to receive data when it’s sent:

```c
uint8_t buffer[256]={1,2,3,4,5,6,7,8};
sdio_slave_buf_handle_t handle = sdio_slave_recv_register_buf(buffer);
sdio_slave_send_queue(buffer, 8, handle, portMAX_DELAY);

//... maybe more transfers are sent here

//and load finished buffer to receive as
sdio_slave_buf_handle_t handle = NULL;
sdio_slave_send_get_finished((void**)&handle, portMAX_DELAY);
sdio_slave_recv_load_buf(handle);
```

More about this, see peripherals/sdio.

Application Example

Slave/master communication: peripherals/sdio.

API Reference

Header File

- soc/include/hal/sdio_slave_types.h

Enumerations

```c
eenum sdio_slave_hostint_t
    Mask of interrupts sending to the host.
    Values:

    SDIO_SLAVE_HOSTINT_BIT0 = BIT(0)
        General purpose interrupt bit 0.
    SDIO_SLAVE_HOSTINT_BIT1 = BIT(1)
    SDIO_SLAVE_HOSTINT_BIT2 = BIT(2)
    SDIO_SLAVE_HOSTINT_BIT3 = BIT(3)
    SDIO_SLAVE_HOSTINT_BIT4 = BIT(4)
    SDIO_SLAVE_HOSTINT_BIT5 = BIT(5)
    SDIO_SLAVE_HOSTINT_BIT6 = BIT(6)
    SDIO_SLAVE_HOSTINT_BIT7 = BIT(7)
```
```c
SDIO_SLAVE_HOSTINT_SEND_NEW_PACKET = BIT(23)
    New packet available.
```

```c
enum sdio_slave_timing_t
    Timing of SDIO slave.
    Values:
        SDIO_SLAVE_TIMING_PSEND_PSAMPLE = 0
            Send at posedge, and sample at posedge. Default value for HS mode. Normally there's no problem using this to work in DS mode.
        SDIO_SLAVE_TIMING_NSEND_PSAMPLE
            Send at negedge, and sample at posedge. Default value for DS mode and below.
        SDIO_SLAVE_TIMING_PSEND_NSAMPLE
            Send at posedge, and sample at negedge.
        SDIO_SLAVE_TIMING_NSEND_NSAMPLE
            Send at negedge, and sample at negedge.
```

```c
enum sdio_slave_sending_mode_t
    Configuration of SDIO slave mode.
    Values:
        SDIO_SLAVE_SEND_STREAM = 0
            Stream mode, all packets to send will be combined as one if possible.
        SDIO_SLAVE_SEND_PACKET = 1
            Packet mode, one packets will be sent one after another (only increase packet_len if last packet sent).
```

**Header File**

- `driver/include/driver/sdio_slave.h`

**Functions**

```c
esp_err_t sdio_slave_initialize(sdio_slave_config_t *config)
    Initialize the sdio slave driver

Return

- ESP_ERR_NOT_FOUND if no free interrupt found.
- ESP_ERR_INVALID_STATE if already initialized.
- ESP_ERR_NO_MEM if fail due to memory allocation failed.
- ESP_OK if success

Parameters

- `config`: Configuration of the sdio slave driver.
```

```c
void sdio_slave_deinit(void)
    De-initialize the sdio slave driver to release the resources.
```

```c
esp_err_t sdio_slave_start(void)
    Start hardware for sending and receiving, as well as set the IOREADY1 to 1.
```
Note The driver will continue sending from previous data and PKT_LEN counting, keep data received as well as start receiving from current TOKEN1 counting. See `sdio_slave_reset`.

Return

- ESP_ERR_INVALID_STATE if already started.
- ESP_OK otherwise.

```c
void sdio_slave_stop(void)
```

Stop hardware from sending and receiving, also set IOREADY1 to 0.

Note this will not clear the data already in the driver, and also not reset the PKT_LEN and TOKEN1 counting. Call `sdio_slave_reset` to do that.

```c
esp_err_t sdio_slave_reset(void)
```

Clear the data still in the driver, as well as reset the PKT_LEN and TOKEN1 counting.

Return always return ESP_OK.

```c
sdio_slave_buf_handle_t sdio_slave_recv_register_buf(uint8_t *start)
```

Register buffer used for receiving. All buffers should be registered before used, and then can be used (again) in the driver by the handle returned.

Note The driver will use and only use the amount of space specified in the `recv_buffer_size` member set in the `sdio_slave_config_t`. All buffers should be larger than that. The buffer is used by the DMA, so it should be DMA capable and 32-bit aligned.

Return The buffer handle if success, otherwise NULL.

Parameters

- `start`: The start address of the buffer.

```c
esp_err_t sdio_slave_recv_unregister_buf(sdio_slave_buf_handle_t handle)
```

Unregister buffer from driver, and free the space used by the descriptor pointing to the buffer.

Return ESP_OK if success, ESP_ERR_INVALID_ARG if the handle is NULL or the buffer is being used.

Parameters

- `handle`: Handle to the buffer to release.

```c
esp_err_t sdio_slave_recv_load_buf(sdio_slave_buf_handle_t handle)
```

Load buffer to the queue waiting to receive data. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

Return

- ESP_ERR_INVALID_ARG if invalid handle or the buffer is already in the queue. Only after the buffer is returned by `sdio_slave_recv` can you load it again.
- ESP_OK if success

Parameters

- `handle`: Handle to the buffer ready to receive data.
esp_err_t sdio_slave_recv(sdio_slave_buf_handle_t *handle_ret, uint8_t **out_addr, size_t *out_len, TickType_t wait)

Get received data if exist. The driver returns the ownership of the buffer to the app.

Note Call sdio_slave_load_buf with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from sdio_slave_get_buffer.

Return

• ESP_ERR_INVALID_ARG if handle_ret is NULL
• ESP_ERR_TIMEOUT if timeout before receiving new data
• ESP_OK if success

Parameters

• handle_ret: Handle to the buffer holding received data. Use this handle in sdio_slave_recv_load_buf to receive in the same buffer again.
• out_addr: Output of the start address, set to NULL if not needed.
• out_len: Actual length of the data in the buffer, set to NULL if not needed.
• wait: Time to wait before data received.

uint8_t *sdio_slave_recv_get_buf(sdio_slave_buf_handle_t handle, size_t *len_o)

Retrieve the buffer corresponding to a handle.

Return buffer address if success, otherwise NULL.

Parameters

• handle: Handle to get the buffer.
• len_o: Output of buffer length

esp_err_t sdio_slave_send_queue(uint8_t *addr, size_t len, void *arg, TickType_t wait)

Put a new sending transfer into the send queue. The driver takes ownership of the buffer until the buffer is returned by sdio_slave_send_get_finished after the transaction is finished.

Return

• ESP_ERR_INVALID_ARG if the length is not greater than 0.
• ESP_ERR_TIMEOUT if the queue is still full until timeout.
• ESP_OK if success.

Parameters

• addr: Address for data to be sent. The buffer should be DMA capable and 32-bit aligned.
• len: Length of the data, should not be longer than 4092 bytes (may support longer in the future).
• arg: Argument to returned in sdio_slave_send_get_finished. The argument can be used to indicate which transaction is done, or as a parameter for a callback. Set to NULL if not needed.
• wait: Time to wait if the buffer is full.

esp_err_t sdio_slave_send_get_finished(void **out_arg, TickType_t wait)

Return the ownership of a finished transaction.

Return ESP_ERR_TIMEOUT if no transaction finished, or ESP_OK if succeed.
Parameters

- `out_arg`: Argument of the finished transaction. Set to NULL if unused.
- `wait`: Time to wait if there’s no finished sending transaction.

```c
esp_err_t sdio_slave_transmit(uint8_t *addr, size_t len)
```

Start a new sending transfer, and wait for it (blocked) to be finished.

**Return**

- ESP_ERR_INVALID_ARG if the length of descriptor is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is full or host do not start a transfer before timeout.
- ESP_OK if success.

**Parameters**

- `addr`: Start address of the buffer to send
- `len`: Length of buffer to send.

```c
uint8_t sdio_slave_read_reg(int pos)
```

Read the spi slave register shared with host.

**Note** register 28 to 31 are reserved for interrupt vector.

**Return** value of the register.

**Parameters**

- `pos`: register address, 0-27 or 32-63.

```c
esp_err_t sdio_slave_write_reg(int pos, uint8_t reg)
```

Write the spi slave register shared with host.

**Note** register 29 and 31 are used for interrupt vector.

**Return** ESP_ERR_INVALID_ARG if address wrong, otherwise ESP_OK.

**Parameters**

- `pos`: register address, 0-11, 14-15, 18-19, 24-27 and 32-63, other address are reserved.
- `reg`: the value to write.

```c
sdio_slave_hostint_t sdio_slave_get_host_intena(void)
```

Get the interrupt enable for host.

**Return** the interrupt mask.

```c
void sdio_slave_set_host_intena(sdio_slave_hostint_t mask)
```

Set the interrupt enable for host.

**Parameters**

- `mask`: Enable mask for host interrupt.

```c
esp_err_t sdio_slave_send_host_int(uint8_t pos)
```

Interrupt the host by general purpose interrupt.
Return

- ESP_ERR_INVALID_ARG if interrupt num error
- ESP_OK otherwise

Parameters

- pos: Interrupt num, 0-7.

```c
void sdio_slave_clear_host_int (sdio_slave_hostint_t mask)
```

Clear general purpose interrupt to host.

Parameters

- mask: Interrupt bits to clear, by bit mask.

```c
escan_result_t sdio_slave_wait_int (int pos, TickType_t wait)
```

Wait for general purpose interrupt from host.

Note this clears the interrupt at the same time.

Return ESP_OK if success, ESP_ERR_TIMEOUT if timeout.

Parameters

- pos: Interrupt source number to wait for. is set.
- wait: Time to wait before interrupt triggered.

Structures

```c
struct sdio_slave_config_t
```

Configuration of SDIO slave.

Public Members

```c
sdio_slave_timing_t timing
```

timing of sdio_slave. see `sdio_slave_timing_t`.

```c
sdio_slave_sending_mode_t sending_mode
```

mode of sdio_slave. `SDIO_SLAVE_MODE_STREAM` if the data needs to be sent as much as possible; `SDIO_SLAVE_MODE_PACKET` if the data should be sent in packets.

```c
int send_queue_size
```

max buffers that can be queued before sending.

```c
size_t recv_buffer_size
```

If buffer_size is too small, it costs more CPU time to handle larger number of buffers. If buffer_size is too large, the space larger than the transaction length is left blank but still counts a buffer, and the buffers are easily run out. Should be set according to length of data really transferred. All data that do not fully fill a buffer is still counted as one buffer. E.g. 10 bytes data costs 2 buffers if the size is 8 bytes per buffer. Buffer size of the slave pre-defined between host and slave before communication. All receive buffer given to the driver should be larger than this.

```c
sdio_event_cb_t event_cb
```

when the host interrupts slave, this callback will be called with interrupt number (0-7).
uint32_t flags
Features to be enabled for the slave, combinations of SDIO_SLAVE_FLAG_*.

Macros

SDIO_SLAVE_RECV_MAX_BUFFER

SDIO_SLAVE_FLAG_DAT2_DISABLED
It is required by the SD specification that all 4 data lines should be used and pulled up even in 1-bit mode or SPI mode. However, as a feature, the user can specify this flag to make use of DAT2 pin in 1-bit mode. Note that the host cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.

SDIO_SLAVE_FLAG_HOST_INTR_DISABLED
The DAT1 line is used as the interrupt line in SDIO protocol. However, as a feature, the user can specify this flag to make use of DAT1 pin of the slave in 1-bit mode. Note that the host has to do polling to the interrupt registers to know whether there are interrupts from the slave. And it cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.

SDIO_SLAVE_FLAG_INTERNAL_PULLUP
Enable internal pullups for enabled pins. It is required by the SD specification that all the 4 data lines should be pulled up even in 1-bit mode or SPI mode. Note that the internal pull-ups are not sufficient for stable communication, please do connect external pull-ups on the bus. This is only for example and debug use.

Type Definitions

typedef void (*sdio_event_cb_t)(uint8_t event)
typedef void *sdio_slave_buf_handle_t
Handle of a receive buffer, register a handle by calling sdio_slave_recv_register_buf. Use the handle to load the buffer to the driver, or call sdio_slave_recv_unregister_buf if it is no longer used.

2.3.15 Sigma-delta Modulation

Introduction

ESP32 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta module.

Functionality Overview

There are eight independent sigma-delta modulation channels identified with sigmadelta_channel_t. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation.

Selected channel should be set up by providing configuration parameters in sigmadelta_config_t and then applying this configuration with sigmadelta_config().

Another option is to call individual functions, that will configure all required parameters one by one:

- **Prescaler** of the sigma-delta generator - sigmadelta_set_prescale()
- **Duty** of the output signal - sigmadelta_set_duty()
- **GPIO pin** to output modulated signal - sigmadelta_set_pin()
The range of the ‘duty’ input parameter of `sigmadelta_set_duty()` is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal’s duty will be about 50%, see description of `sigmadelta_set_duty()`.

Application Example

Sigma-delta Modulation example: `peripherals/sigmadelta`.

API Reference

Header File

- `driver/include/driver/sigmadelta.h`

Functions

```c
esp_err_t sigmadelta_config(const sigmadelta_config_t *config)
```

Configure Sigma-delta channel.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver already initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `config`: Pointer of Sigma-delta channel configuration struct

```c
esp_err_t sigmadelta_set_duty(sigmadelta_channel_t channel, int8_t duty)
```

Set Sigma-delta channel duty.

This function is used to set Sigma-delta channel duty, If you add a capacitor between the output pin and ground, the average output voltage will be \( V_{dc} = V_{DDIO} / 256 \times \text{duty} + V_{DDIO}/2 \), where \( V_{DDIO} \) is the power supply voltage.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `channel`: Sigma-delta channel number
- `duty`: Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.

```c
esp_err_t sigmadelta_set_prescale(sigmadelta_channel_t channel, uint8_t prescale)
```

Set Sigma-delta channel’s clock pre-scale value. The source clock is APP_CLK, 80MHz. The clock frequency of the sigma-delta channel is APP_CLK / pre_scale.
Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- channel: Sigma-delta channel number
- prescale: The divider of source clock, ranges from 0 to 255

```c
esp_err_t sigmadelta_set_pin(sigmadelta_channel_t channel, gpio_num_t gpio_num)
```

Set Sigma-delta signal output pin.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- channel: Sigma-delta channel number
- gpio_num: GPIO number of output pin.

Header File

- soc/include/hal/sigmadelta_types.h

Structures

```c
struct sigmadelta_config_t
```

Sigma-delta configure struct.

Public Members

```c
sigmadelta_channel_t channel
```

Sigma-delta channel number

```c
int8_t sigmadelta_duty
```

Sigma-delta duty, duty ranges from -128 to 127.

```c
uint8_t sigmadelta_prescale
```

Sigma-delta prescale, prescale ranges from 0 to 255.

```c
uint8_t sigmadelta_gpio
```

Sigma-delta output io number, refer to gpio.h for more details.
Type Definitions

typedef int sigmadelta_port_t
SIGMADELTA port number, the max port number is (SIGMADELTA_NUM_MAX -1).

typedef int sigmadelta_channel_t
Sigma-delta channel list.

2.3.16 SPI Master Driver

SPI Master driver is a program that controls ESP32’s SPI peripherals while they function as masters.

Overview of ESP32’s SPI peripherals

ESP32 integrates four SPI peripherals.
  • SPI0 and SPI1 are used internally to access the ESP32’s attached flash memory and thus are currently not open to users. They share one signal bus via an arbiter.
  • SPI2 and SPI3 are general purpose SPI controllers, sometimes referred to as HSPI and VSPI, respectively. They are open to users. SPI2 and SPI3 have independent signal buses with the same respective names. Each bus has three CS lines to drive up to three SPI slaves.

Terminology

The terms used in relation to the SPI master driver are given in the table below.
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Host</strong></td>
<td>The SPI controller peripheral inside ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master. This may be the SPI2 or SPI3 peripheral. (The driver will also support the SPI1 peripheral in the future.)</td>
</tr>
<tr>
<td><strong>Device</strong></td>
<td>SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td><strong>Bus</strong></td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td><strong>MISO</strong></td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.</td>
</tr>
<tr>
<td><strong>MOSI</strong></td>
<td>Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.</td>
</tr>
<tr>
<td><strong>SCLK</strong></td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td><strong>CS</strong></td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td><strong>QUADWP</strong></td>
<td>Write Protect signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td><strong>QUADHD</strong></td>
<td>Hold signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td><strong>Assertion</strong></td>
<td>The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called de-assertion.</td>
</tr>
<tr>
<td><strong>Transaction</strong></td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td><strong>Launch edge</strong></td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td><strong>Latch edge</strong></td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

**Driver Features**

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
• Automatic time-division multiplexing of data coming from different Devices on the same signal bus

**Warning:** The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is not thread-safe. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

### SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>In this phase, a command (0-16 bit) is written to the bus by the Host.</td>
</tr>
<tr>
<td>Address</td>
<td>In this phase, an address (0-64 bit) is transmitted over the bus by the Host.</td>
</tr>
<tr>
<td>Write</td>

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `length` and `rxlength` members of the struct `spi_transaction_t` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device’s configuration: if `command_bits` and/or `address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `tx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see *Notes on Sending Mixed Transactions to the Same Device.*
**Interrupt Transactions**

Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

**Polling Transactions**

Polling transactions do not use interrupts. The routine keeps polling the SPI Host’s status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction intervals. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see Bus Acquiring.

**Command and Address Phases**

During the command and address phases, the members `cmd` and `addr` in the struct `spi_transaction_t` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `command_bits` and `address_bits` set in the struct `spi_transaction_ext_t`.

**Write and Read Phases**

Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `rx_buffer` and `tx_buffer` of the structure `spi_transaction_t`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If `external PSRAM is enabled`, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (staring from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.
Note: Half-duplex transactions with both read and write phases are not supported when using DMA. For details and workarounds, see Known Issues.

Bus Acquiring

Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to -1.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device’s handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the `peripherals/spi_master` directory of ESP-IDF examples.

Transactions with Data Not Exceeding 32 Bits

When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `tx_buffer` or `rx_buffer` members, because they use the same memory locations as `tx_data` and `rx_data`. 
Transactions with Integers Other Than uint8_t

An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if 0b00010 needs to be sent, it should be written into a uint8_t variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32 is a little-endian chip, which means that the least significant byte of uint16_t and uint32_t variables is stored at the smallest address. Hence, if uint16_t is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from uint8_t arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- SPI_SWAP_DATA_TX for data to be transmitted
- SPI_SWAP_DATA_RX for data received

Notes on Sending Mixed Transactions to the Same Device

To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function spi_device_polling_end() after spi_device_polling_start() to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with spi_device_polling_transmit() so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call spi_device_polling_start(). To do that, you can keep calling spi_device_get_trans_result() until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

GPIO Matrix and IO_MUX

Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

The GPIO matrix introduces flexibility of routing but also brings the following disadvantages:

- Increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.
- Allows signals with clock frequencies only up to 40 MHz, as opposed to 80 MHz if IO_MUX pins are used.
Note: For more details about the influence of the MISO input delay on the maximum clock frequency, see *Timing Considerations*.

The IO_MUX pins for SPI buses are given below.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>SPI2 GPIO Number</th>
<th>SPI3 GPIO Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0*</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>SCLK</td>
<td>14</td>
<td>18</td>
</tr>
<tr>
<td>MISO</td>
<td>12</td>
<td>19</td>
</tr>
<tr>
<td>MOSI</td>
<td>13</td>
<td>23</td>
</tr>
<tr>
<td>QUADWP</td>
<td>2</td>
<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

- Only the first Device attached to the bus can use the CS0 pin.

Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

Transaction Interval

Transaction interval is the time that software requires to set up SPI peripheral registers and to copy data to FIFOs, or to set up DMA links.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For interrupt transactions, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the interval. See *Interrupt Transactions*. For polling transactions, it does not block the task but allows to do polling when the transaction is in progress. For more information, see *Polling Transactions*.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction interval timings for one byte of data are given below.

<table>
<thead>
<tr>
<th></th>
<th>Interrupt (us)</th>
<th>Polling (us)</th>
</tr>
</thead>
<tbody>
<tr>
<td>DMA</td>
<td>24</td>
<td>8</td>
</tr>
<tr>
<td>No DMA</td>
<td>22</td>
<td>7</td>
</tr>
</tbody>
</table>
**SPI Clock Frequency**

Transferring each byte takes eight times the clock period $\frac{8}{f_{spi}}$. If the clock frequency is too high, the use of some functions might be limited. See *Timing Considerations*.

**Cache Miss**

The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from the cache miss and will need to wait until the code is read from the flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache miss.

For an interrupt transaction, the overall cost is $20+8n/f_{spi}[MHz]$ [us] for n bytes transferred in one transaction. Hence, the transferring speed is: $\frac{n}{20+8n/f_{spi}}$. An example of transferring speed at 8 MHz clock speed is given in the following table.

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (us)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (us)</th>
<th>Total Speed (KBps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see *IRAM-Safe Interrupt Handlers*.

**Timing Considerations**

As shown in the figure below, there is a delay on the MISO line after the SCLK launch edge and before the signal is latched by the internal register. As a result, the MISO pin setup time is the limiting factor for the SPI clock speed. When the delay is too long, the setup slack is $< 0$, and the setup timing requirement is violated, which results in the failure to perform the reading correctly.
The maximum allowed frequency is dependent on:

- `input_delay_ns` - maximum data valid time on the MISO bus after a clock cycle on SCLK starts
- If the IO_MUX pin or the GPIO Matrix is used

When the GPIO matrix is used, the maximum allowed frequency is reduced to about 33–77% in comparison to the existing `input delay`. To retain a higher frequency, you have to use the IO_MUX pins or the `dummy bit workaround`. You can obtain the maximum reading frequency of the master by using the function `spi_get_freq_limit()`.

**Dummy bit workaround:** Dummy clocks, during which the Host does not read data, can be inserted before the read phase begins. The Device still sees the dummy clocks and sends out data, but the Host does not read until the read phase comes. This compensates for the lack of the MISO setup time required by the Host and allows the Host to do reading at a higher frequency.

In the ideal case, if the Device is so fast that the input delay is shorter than an APB clock cycle - 12.5 ns - the maximum frequency at which the Host can read (or read and write) in different conditions is as follows:

<table>
<thead>
<tr>
<th>Frequency Limit (MHz)</th>
<th>Dummy Bits Used By Driver</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO matrix</td>
<td>IO_MUX pins</td>
<td></td>
</tr>
<tr>
<td>26.6</td>
<td>80</td>
<td>No</td>
</tr>
<tr>
<td>40</td>
<td></td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Half-duplex, no DMA allowed</td>
</tr>
</tbody>
</table>

If the Host only writes data, the `dummy bit workaround` and the frequency check can be disabled by setting the bit `SPIDEVICE_NO_DUMMY` in the member `spi_device_interface_config_t::flags`. When disabled, the output frequency can be 80MHz, even if the GPIO matrix is used.

The SPI master driver can work even if the `input_delay_ns` in the structure `spi_device_interface_config_t` is set to 0. However, setting an accurate value helps to:

- Calculate the frequency limit for full-duplex transactions
- Compensate the timing correctly with dummy bits for half-duplex transactions
You can approximate the maximum data valid time after the launch edge of SPI clocks by checking the statistics in the AC characteristics chapter of your Device’s specification or measure the time on an oscilloscope or logic analyzer.

Please note that the actual PCB layout design and the excessive loads may increase the input delay. It means that non-optimal wiring and/or a load capacitor on the bus will most likely lead to the input delay values exceeding the values given in the Device specification or measured while the bus is floating.

Some typical delay values are shown in the following table.

<table>
<thead>
<tr>
<th>Device</th>
<th>Input delay (ns)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ideal Device</td>
<td>0</td>
</tr>
<tr>
<td>ESP32 slave using IO_MUX*</td>
<td>50</td>
</tr>
<tr>
<td>ESP32 slave using GPIO_MUX*</td>
<td>75</td>
</tr>
<tr>
<td>ESP32’s slave device is on a different physical chip.</td>
<td></td>
</tr>
</tbody>
</table>

The MISO path delay (valid time) consists of a slave’s input delay plus master’s GPIO matrix delay. This delay determines the frequency limit above which full-duplex transfers will not work as well as the dummy bits used in the half-duplex transactions. The frequency limit is:

\[
 Freq \ limit \ [MHz] = \frac{80}{\text{floor}(\text{MISO delay}[\text{ns}] / 12.5) + 1} 
\]

The figure below shows the relationship between frequency limit and input delay. Two extra APB clock cycle periods should be added to the MISO delay if the master uses the GPIO matrix.

Corresponding frequency limits for different Devices with different input delay times are shown in the table below.
<table>
<thead>
<tr>
<th>Master</th>
<th>Input delay (ns)</th>
<th>MISO path delay (ns)</th>
<th>Freq. limit (MHz)</th>

</tr>
</tbody>
</table>

**Known Issues**

1. Half-duplex transactions are not compatible with DMA when both writing and reading phases are used.

   If such transactions are required, you have to use one of the alternative solutions:

   1. Use full-duplex transactions instead.
   2. Disable DMA by setting the bus initialization function’s last parameter to 0 as follows:

   ```c
   ret=spi_bus_initialize(VSPI_HOST, &buscfg, 0);
   ```

   This can prohibit you from transmitting and receiving data longer than 64 bytes.

   3. Try using the command and address fields to replace the write phase.

2. Full-duplex transactions are not compatible with the *dummy bit workaround*, hence the frequency is limited. See *dummy bit speed-up workaround*.

3. *cs_ena_pretrans* is not compatible with the command and address phases of full-duplex transactions.

**Application Example**

The code example for displaying graphics on an ESP32-WROVER-KIT’s 320x240 LCD screen can be found in the `peripherals/spi_master` directory of ESP-IDF examples.

**API Reference - SPI Common**

**Header File**

- soc/include/hal/spi_types.h

**Enumerations**

```c
enumber spi_host_device_t
   Enum with the three SPI peripherals that are software-accessible in it.
   Values:
   SPI1_HOST =0
   SPI1.
   SPI2_HOST =1
   SPI2.
   SPI3_HOST =2
   SPI3.
```
Header File

- driver/include/driver/spi_common.h

Functions

esp_err_t spi_bus_initialize(spi_host_device_t host, const spi_bus_config_t *bus_config, int dma_chan)

Initialize a SPI bus.

Warning  For now, only supports HSPI and VSPI.

Warning  If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

Warning  The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

Return

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- host: SPI peripheral that controls this bus
- bus_config: Pointer to a spi_bus_config_t struct specifying how the host should be initialized
- dma_chan: Either channel 1 or 2, or 0 in the case when no DMA is required. Selecting a DMA channel for a SPI bus allows transfers on the bus to have sizes only limited by the amount of internal memory. Selecting no DMA channel (by passing the value 0) limits the amount of bytes transferred to a maximum of 64. Set to 0 if only the SPI flash uses this bus.

esp_err_t spi_bus_free(spi_host_device_t host)

Free a SPI bus.

Warning  In order for this to succeed, all devices have to be removed first.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

Parameters

- host: SPI peripheral to free

Structures

struct spi_bus_config_t

This is a configuration structure for a SPI bus.
You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

**Note** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in `spi_bus_config_t` referring to these lines will be ignored and can thus safely be left uninitialized.

### Public Members

- `int mosi_io_num`  
  GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

- `int miso_io_num`  
  GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

- `int sclk_io_num`  
  GPIO pin for Spi CLock signal, or -1 if not used.

- `int quadwp_io_num`  
  GPIO pin for WP (Write Protect) signal which is used as D2 in 4-bit communication modes, or -1 if not used.

- `int quadhd_io_num`  
  GPIO pin for HD (Hold) signal which is used as D3 in 4-bit communication modes, or -1 if not used.

- `int max_transfer_sz`  
  Maximum transfer size, in bytes. Defaults to 4094 if 0.

- `uint32_t flags`  
  Abilities of bus to be checked by the driver. Or-ed value of SPICOMMON_BUSFLAG_* flags.

- `int intr_flags`  
  Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

### Macros

**SPI_MAX_DMA_LEN**

**SPI_SWAP_DATA_TX** (DATA, LEN)

Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```c
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points tx_buffer to &data.

### Parameters

- **DATA**: Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN**: Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.
SPI_SWAP_DATA_RX (DATA, LEN)
Transform received data of length \( \leq 32 \) bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```c
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

Parameters
- **DATA**: Data to be rearranged, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN**: Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

SPICOMMON_BUSFLAG_SLAVE
Initialize I/O in slave mode.

SPICOMMON_BUSFLAG_MASTER
Initialize I/O in master mode.

SPICOMMON_BUSFLAG_IOMUX_PINS
Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

SPICOMMON_BUSFLAG_SCLK
Check existing of SCLK pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_MISO
Check existing of MISO pin. Or indicates MISO line initialized.

SPICOMMON_BUSFLAG_MOSI
Check existing of MOSI pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_DUAL
Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

SPICOMMON_BUSFLAG_WPHD
Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

SPICOMMON_BUSFLAG_QUAD
Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

SPICOMMON_BUSFLAG_NATIVE_PINS

API Reference - SPI Master

Header File
- `driver/include/driver/spi_master.h`

Functions

```c
esp_err_t spi_bus_add_device (spi_host_device_t host, const spi_device_interface_config_t *dev_config, spi_device_handle_t *handle)
```
Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.
Note While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_FOUND if host doesn’t have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters
- host: SPI peripheral to allocate device on
- dev_config: SPI interface protocol config for the device
- handle: Pointer to variable to hold the device handle

esp_err_t spi_bus_remove_device (spi_device_handle_t handle)
Remove a device from the SPI bus.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success

Parameters
- handle: Device handle to free

esp_err_t spi_device_queue_trans (spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)
Queue a SPI transaction for interrupt transaction execution. Get the result by spi_device_get_trans_result.

Note Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if there was no room in the queue before ticks_to_wait expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

Parameters
- handle: Device handle obtained using spi_host_add_dev
- trans_desc: Description of transaction to execute
- ticks_to_wait: Ticks to wait until there’s room in the queue; use portMAX_DELAY to never time out.
**esp_err_t spi_device_get_trans_result** *(spi_device_handle_t handle, spi_transaction_t **trans_desc, TickType_t ticks_to_wait)*

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if there was no completed transaction before `ticks_to_wait` expired
- ESP_OK on success

**Parameters**

- **handle**: Device handle obtained using `spi_host_add_dev`
- **trans_desc**: Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- **ticks_to_wait**: Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

**esp_err_t spi_device_transmit** *(spi_device_handle_t handle, spi_transaction_t *trans_desc)*

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`.

Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or polling_start/transmit that hasn’t been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**

- **handle**: Device handle obtained using `spi_host_add_dev`
- **trans_desc**: Description of transaction to execute

**esp_err_t spi_device_polling_start** *(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)*

Immediately start a polling transaction.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the device cannot get control of the bus before `ticks_to_wait` expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
• ESP_ERR_INVALID_STATE if previous transactions are not finished
• ESP_OK on success

Parameters

• handle: Device handle obtained using spi_host_add_dev
• trans_desc: Description of transaction to execute
• ticks_to_wait: Ticks to wait until there's room in the queue; currently only portMAX_DELAY is supported.

`esp_err_t spi_device_polling_end(spi_device_handle_t handle, TickType_t ticks_to_wait)`
Poll until the polling transaction ends.
This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

Return

• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_TIMEOUT if the transaction cannot finish before ticks_to_wait expired
• ESP_OK on success

Parameters

• handle: Device handle obtained using spi_host_add_dev
• ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

`esp_err_t spi_device_polling_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)`
Send a polling transaction, wait for it to complete, and return the result.
This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn’t been finalized.

Note This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Return

• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_OK on success

Parameters

• handle: Device handle obtained using spi_host_add_dev
• trans_desc: Description of transaction to execute

`esp_err_t spi_device_acquire_bus(spi_device_handle_t device, TickType_t wait)`
Occupy the SPI bus for a device to do continuous transactions.
Transactions to all other devices will be put off until `spi_device_release_bus` is called.

Note The function will wait until all the existing transactions have been sent.

Return
• ESP_ERR_INVALID_ARG: `wait` is not set to portMAX_DELAY.
• ESP_OK: Success.

Parameters
• `device`: The device to occupy the bus.
• `wait`: Time to wait before the bus is occupied by the device. Currently MUST set to portMAX_DELAY.

```c
void spi_device_release_bus(spi_device_handle_t dev)
```
Release the SPI bus occupied by the device. All other devices can start sending transactions.

Parameters
• `dev`: The device to release the bus.

```c
int spi_cal_clock(int fapb, int hz, int duty_cycle, uint32_t *reg_o)
```
Calculate the working frequency that is most close to desired frequency, and also the register value.

Parameters
• `fapb`: The frequency of apb clock, should be APB_CLK_FREQ.
• `hz`: Desired working frequency
• `duty_cycle`: Duty cycle of the spi clock
• `reg_o`: Output of value to be set in clock register, or NULL if not needed.

Return Actual working frequency that most fit.

```c
int spi_get_actual_clock(int fapb, int hz, int duty_cycle)
```
Calculate the working frequency that is most close to desired frequency.

Return Actual working frequency that most fit.

Parameters
• `fapb`: The frequency of apb clock, should be APB_CLK_FREQ.
• `hz`: Desired working frequency
• `duty_cycle`: Duty cycle of the spi clock

```c
void spi_get_timing(bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)
```
Calculate the timing settings of specified frequency and settings.

Note If **dummy_o** is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

Parameters
• `gpio_is_used`: True if using GPIO matrix, or False if iomux pins are used.
• `input_delay_ns`: Input delay from SCLK launch edge to MISO data valid.
• `eff_clk`: Effective clock frequency (in Hz) from spi_cal_clock.
• `dummy_o`: Address of dummy bits used output. Set to NULL if not needed.
• `cycles_remain_o`: Address of cycles remaining (after dummy bits are used) output.
- 1 If too many cycles remaining, suggest to compensate half a clock.
- 0 If no remaining cycles or dummy bits are not used.
- positive value: cycles suggest to compensate.

```c
int spi_get_freq_limit (bool gpio_is_used, int input_delay_ns)
```

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Return** Frequency limit of current configurations.

**Parameters**

- `gpio_is_used`: True if using GPIO matrix, or False if native pins are used.
- `input_delay_ns`: Input delay from SCLK launch edge to MISO data valid.

**Structures**

```c
struct spi_device_interface_config_t
```

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

**Public Members**

- `uint8_t command_bits`: Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.
- `uint8_t address_bits`: Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.
- `uint8_t dummy_bits`: Amount of dummy bits to insert between address and data phase.
- `uint8_t mode`: SPI mode (0-3)
- `uint16_t duty_cycle_pos`: Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.
- `uint16_t cs_ena_pretrans`: Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.
- `uint8_t cs_ena_posttrans`: Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)
- `int clock_speed_hz`: Clock speed, divisors of 80MHz, in Hz. See `SPI_MASTER_FREQ_*`.
- `int input_delay_ns`: Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it’s suggest to have the right value.
int spics_io_num
    CS GPIO pin for this device, or -1 if not used.

uint32_t flags
    Bitwise OR of SPI_DEVICE_* flags.

int queue_size
    Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using
    spi_device_queue_trans but not yet finished using spi_device_get_trans_result) at the same time.

transaction_cb_t pre_cb
    Callback to be called before a transmission is started.

    This callback is called within interrupt context should be in IRAM for best performance, see “Transferring
    Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash
    operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

transaction_cb_t post_cb
    Callback to be called after a transmission has completed.

    This callback is called within interrupt context should be in IRAM for best performance, see “Transferring
    Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash
    operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_transaction_t
    This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

Public Members

uint32_t flags
    Bitwise OR of SPI_TRANS_* flags.

uint16_t cmd
    Command data, of which the length is set in the command_bits of spi_device_interface_config_t.

    NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new
    way in ESP-IDF 3.0.

    Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3_ (in previous version, you
    may have to write 0x3_12).

uint64_t addr
    Address data, of which the length is set in the address_bits of spi_device_interface_config_t.

    NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new
    way in ESP-IDF3.0.

    Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version,
    you may have to write 0x12340000).

size_t length
    Total data length, in bits.

size_t rxlength
    Total data length received, should be not greater than length in full-duplex mode (0 defaults this to the
    value of length).

void *user
    User-defined variable. Can be used to store eg transaction ID.

const void *tx_buffer
    Pointer to transmit buffer, or NULL for no MOSI phase.
uint8_t tx_data[4]
   If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

void *rx_buffer
   Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t rx_data[4]
   If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct spi_transaction_ext_t
   This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members

struct spi_transaction_t base
   Transaction data, so that pointer to spi_transaction_t can be converted into spi_transaction_ext_t.

uint8_t command_bits
   The command length in this transaction, in bits.

uint8_t address_bits
   The address length in this transaction, in bits.

uint8_t dummy_bits
   The dummy length in this transaction, in bits.

Macros

SPI_DEVICE_TXBIT_LSBFIRST
   Transmit command/address/data LSB first instead of the default MSB first.

SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz). 8MHz

SPI_DEVICE_RXBIT_LSBFIRST
   Receive data LSB first instead of the default MSB first.

SPI_DEVICE_BIT_LSBFIRST
   Transmit and receive LSB first.

SPI_DEVICE_3WIRE
   Use MOSI (=spid) for both sending and receiving data.

SPI_DEVICE_POSITIVE_CS
   Make CS positive during a transaction instead of negative.

SPI_DEVICE_HALFDUPLEX
   Transmit data before receiving it, instead of simultaneously.

SPI_DEVICE_CLK_AS_CS
   Output clock on CS line if CS is active.

SPI_DEVICE_NO_DUMMY
   There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

   • In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
• In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

**SPI_DEVICE_DDRCLK**

**SPI_TRANS_MODE_DIO**
Transmit/receive data in 2-bit mode.

**SPI_TRANS_MODE_QIO**
Transmit/receive data in 4-bit mode.

**SPI_TRANS_USE_RXDATA**
Receive into rx_data member of *spi_transaction_t* instead into memory at rx_buffer.

**SPI_TRANS_USE_TXDATA**
Transmit tx_data member of *spi_transaction_t* instead of data at tx_buffer. Do not set tx_buffer when using this.

**SPI_TRANS_MODE_DIOQIO_ADDR**
Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

**SPI_TRANS_VARIABLE_CMD**
Use the command_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

**SPI_TRANS_VARIABLE_ADDR**
Use the address_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

**SPI_TRANS_VARIABLE_DUMMY**
Use the dummy_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

**SPI_TRANS_SET_CD**
Set the CD pin.

**Type Definitions**

```c
typedef struct spi_transaction_t spi_transaction_t
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
typedef struct spi_device_t *spi_device_handle_t
Handle for a device on a SPI bus.
```

### 2.3.17 SPI Slave Driver

SPI Slave driver is a program that controls ESP32’s SPI peripherals while they function as slaves.

#### Overview of ESP32’s SPI peripherals

ESP32 integrates two general purpose SPI controllers which can be used as slave nodes driven by an off-chip SPI master.

- SPI2, sometimes referred to as HSPI
- SPI3, sometimes referred to as VSPI

SPI2 and SPI3 have independent signal buses with the same respective names.
## Terminology

The terms used in relation to the SPI slave driver are given in the table below.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The SPI controller peripheral external to ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td>Device</td>
<td>SPI slave device, in this case the SPI2 and SPI3 controllers. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td>Bus</td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td>• MISO</td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.</td>
</tr>
<tr>
<td>• MOSI</td>
<td>Master In, Slave Out, a.k.a. D. Data transmission from a Host to Device.</td>
</tr>
<tr>
<td>• SCLK</td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td>• CS</td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td>• QUADWP</td>
<td>Write Protect signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td>• QUADHD</td>
<td>Hold signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td>• Assertion</td>
<td>The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called de-assertion.</td>
</tr>
<tr>
<td>Transaction</td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td>Launch edge</td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td>Latch edge</td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

## Driver Features

The SPI slave driver allows using the SPI2 and/or SPI3 peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some
known issues related to DMA.

**SPI Transactions**

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI host acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`. As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see Transaction Interval.

**Driver Usage**

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize`. Make sure to set the correct I/O pins in the `bus_config`. Set the unused signals to -1. If transactions will be longer than 32 bytes, allow a DMA channel 1 or 2 by setting the parameter `dma_chan` to 1 or 2 respectively. Otherwise, set `dma_chan` to 0.

- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.

- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

**Transaction Data and Master/Slave Length Mismatches**

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the `spi_transaction_t` structure. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by the member `spi_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction’s length is determined by a Host which drives the clock and CS lines. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `length` member will be sent and received. In this case, `trans_len` is set to `length` instead of the actual transaction length. To meet the actual transaction length requirements, set `length` to a value greater than the maximum `trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.
**Warning:** The ESP32 DMA hardware has a limit to the number of bytes sent by a Host and received by a Device. The transaction length must be longer than 8 bytes and a multiple of 4 bytes; otherwise, the SPI hardware might fail to receive the last 1 to 7 bytes.

### GPIO Matrix and IO_MUX

Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix.

If at least one signal is routed through the GPIO matrix, then all signals will be routed through it. The GPIO matrix samples all signals at 80 MHz and transmits them between the GPIO and the peripheral.

If the driver is configured so that all SPI signals are either routed to their dedicated IO_MUX pins or are not connected at all, the GPIO matrix will be bypassed.

The GPIO matrix introduces flexibility of routing but also increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.

**Note:** For more details about the influence of the MISO input delay on the maximum clock frequency, see *Timing Considerations*.

The IO_MUX pins for SPI buses are given below.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>SPI2 GPIO Number</th>
<th>SPI3 GPIO Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0*</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>SCLK</td>
<td>14</td>
<td>18</td>
</tr>
<tr>
<td>MISO</td>
<td>12</td>
<td>19</td>
</tr>
<tr>
<td>MOSI</td>
<td>13</td>
<td>23</td>
</tr>
<tr>
<td>QUADWP</td>
<td>2</td>
<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

* Only the first Device attached to the bus can use the CS0 pin.

### Speed and Timing Considerations

#### Transaction Interval

The ESP32 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device’s response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in `peripherals/spi_slave`. 
SCLK Frequency Requirements

The SPI slaves are designed to operate at up to 10 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

On top of that, there are additional requirements for the data to meet the timing constraints:

- **Read (MOSI):** The Device can read data correctly only if the data is already set at the launch edge. Although it is usually the case for most masters.

- **Write (MISO):** The output delay of the MISO signal needs to be shorter than half of a clock cycle period so that the MISO line is stable before the next latch edge. Given that the clock is balanced, the output delay and frequency limitations in different cases are given below.

<table>
<thead>
<tr>
<th></th>
<th>Output delay of MISO (ns)</th>
<th>Freq. limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IO_MUX</td>
<td>43.75</td>
<td>&lt;11.4</td>
</tr>
<tr>
<td>GPIO matrix</td>
<td>68.75</td>
<td>&lt;7.2</td>
</tr>
</tbody>
</table>

**Note:**

1. If the frequency is equal to the limitation, it can lead to random errors.
2. The clock uncertainty between Host and Device (12.5ns) is included.
3. The output delay is measured under ideal circumstances (no load). If the MISO pin is heavily loaded, the output delay will be longer, and the maximum allowed frequency will be lower.

Exception: The frequency is allowed to be higher if the master has more tolerance for the MISO setup time, e.g., latch data at the next edge than expected, or configurable latching time.

Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.

   Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

2. Furthermore, DMA requires SPI modes 1 and 3. For SPI modes 0 and 2, the MISO signal has to be launched half a clock cycle earlier to meet the timing. The new timing is as follows:

   ![Timing Diagram]

   If DMA is enabled, a Device’s launch edge is half of an SPI clock cycle ahead of the normal time, shifting to the Master’s actual latch edge. In this case, if the GPIO matrix is bypassed, the hold time for data sampling is 68.75 ns and no longer a half of an SPI clock cycle. If the GPIO matrix is used, the hold time will increase to 93.75 ns. The Host should sample the data immediately at the latch edge or communicate in SPI modes 1 or 3. If your Host cannot meet these timing requirements, initialize your Device without DMA.
Application Example

The code example for Device/Host communication can be found in the peripherals/spi_slave directory of ESP-IDF examples.

API Reference

Header File

- driver/include/driver/spi_slave.h

Functions

```c
esp_err_t spi_slave_initialize(spi_host_device_t host, const spi_bus_config_t *bus_config,
                              const spi_slave_interface_config_t *slave_config, int dma_chan)
```

Initialize a SPI bus as a slave interface.

**Warning** For now, only supports HSPI and VSPI.

**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Return**

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**

- `host`: SPI peripheral to use as a SPI slave interface
- `bus_config`: Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- `slave_config`: Pointer to a `spi_slave_interface_config_t` struct specifying the details for the slave interface
- `dma_chan`: Either 1 or 2. A SPI bus used by this driver must have a DMA channel associated with it. The SPI hardware has two DMA channels to share. This parameter indicates which one to use.

```c
esp_err_t spi_slave_free(spi_host_device_t host)
```

Free a SPI bus claimed as a SPI slave interface.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

**Parameters**

- `host`: SPI peripheral to free
**esp_err_t** spi_slave_queue_trans**(spi_host_device_t host, const spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)**

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialized via spi_slave_initialize.) This function may block if the queue is full (depending on the ticks_to_wait parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in trans_desc to the SPI slave driver; the application is not to access this memory until spi_slave_queue_trans is called to hand ownership back to the application.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters

- **host**: SPI peripheral that is acting as a slave
- **trans_desc**: Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait**: Ticks to wait until there’s room in the queue; use portMAX_DELAY to never time out.

**esp_err_t** spi_slave_get_trans_result**(spi_host_device_t host, spi_slave_transaction_t **trans_desc, TickType_t ticks_to_wait)**

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with spi_slave_queue_trans) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by spi_slave_queue_trans.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters

- **host**: SPI peripheral to that is acting as a slave
- **trans_desc**: Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks_to_wait**: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

**esp_err_t** spi_slave_transmit**(spi_host_device_t host, spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)**

Do a SPI transaction.

Essentially does the same as spi_slave_queue_trans followed by spi_slave_get_trans_result. Do not use this when there is still a transaction queued that hasn’t been finalized using spi_slave_get_trans_result.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_OK on success

Parameters

• host: SPI peripheral to that is acting as a slave
• trans_desc: Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
• ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

Structures

struct spi_slave_interface_config_t
This is a configuration for a SPI host acting as a slave device.

Public Members

int spics_io_num
CS GPIO pin for this device.

uint32_t flags
Bitwise OR of SPI_SLAVE_* flags.

int queue_size
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.

uint8_t mode
SPI mode (0-3)

slave_transaction_cb_t post_setup_cb
Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

slave_transaction_cb_t post_trans_cb
Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_slave_transaction_t
This structure describes one SPI transaction

Public Members

size_t length
Total data length, in bits.

size_t trans_len
Transaction data length, in bits.
const void *tx_buffer
    Pointer to transmit buffer, or NULL for no MOSI phase.

void *rx_buffer
    Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary \((rx_buffer%4==0)\), and has length of a multiple of 4 bytes.

void *user
    User-defined variable. Can be used to store eg transaction ID.

Macros

SPI_SLAVE_TXBIT_LSBFIRST
    Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST
    Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST
    Transmit and receive LSB first.

Type Definitions

typedef struct spi_slave_transaction_t spi_slave_transaction_t

typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)

2.3.18 ESP32-S2 Temperature Sensor

Overview

The ESP32-S2 has a built-in temperature sensor. The temperature sensor module contains an 8-bit Sigma-Delta ADC and a temperature offset DAC. The conversion relationship is the first columns of the table below. Among them, offset = 0 is the main measurement option, and other values are extended measurement options.

<table>
<thead>
<tr>
<th>offset</th>
<th>measure range(Celsius)</th>
<th>measure error(Celsius)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-2</td>
<td>50 ~ 125</td>
<td>&lt; 3</td>
</tr>
<tr>
<td>-1</td>
<td>20 ~ 100</td>
<td>&lt; 2</td>
</tr>
<tr>
<td>0</td>
<td>-10 ~ 80</td>
<td>&lt; 1</td>
</tr>
<tr>
<td>1</td>
<td>-30 ~ 50</td>
<td>&lt; 2</td>
</tr>
<tr>
<td>2</td>
<td>-40 ~ 20</td>
<td>&lt; 3</td>
</tr>
</tbody>
</table>

Application Example

Temperature sensor reading example: peripherals/temp_sensor.

API Reference - Normal Temp Sensor

Header File

- driver/esp32s2beta/include/temp_sensor.h
Functions

`esp_err_t temp_sensor_set_config (temp_sensor_config_t tsens)`
Set parameter of temperature sensor.

Return
- ESP_OK Success

Parameters
- tsens:

`esp_err_t temp_sensor_get_config (temp_sensor_config_t *tsens)`
Get parameter of temperature sensor.

Return
- ESP_OK Success

Parameters
- tsens:

`esp_err_t temp_sensor_start (void)`
Start temperature sensor measure.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG

`esp_err_t temp_sensor_stop (void)`
Stop temperature sensor measure.

Return
- ESP_OK Success

`esp_err_t temp_sensor_read_raw (uint32_t *tsens_out)`
Read temperature sensor raw data.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG tsens_out is NULL
- ESP_ERR_INVALID_STATE temperature sensor dont start

Parameters
- tsens_out: Pointer to raw data, Range: 0 ~ 255

`esp_err_t temp_sensor_read_celsius (float *celsius)`
Read temperature sensor data that is converted to degrees Celsius.

Note  Should not be called from interrupt.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG ARG is NULL.
• ESP_ERR_INVALID_STATE The ambient temperature is out of range.

Parameters
• celsius: The measure output value.

Structures

struct temp_sensor_config_t
Configuration for temperature sensor reading.

Public Members

temp_sensor_dac_offset_t dac_offset
The temperature measurement range is configured with a built-in temperature offset DAC.

uint8_t clk_div
Default: 6

Macros

TSENS_CONFIG_DEFAULT()

Enumerations

enum temp_sensor_dac_offset_t
Values:

TSENS_DAC_L0 = 0
offset = -2, measure range: 50°C ~ 125°C, error < 3°C.

TSENS_DAC_L1
offset = -1, measure range: 20°C ~ 100°C, error < 2°C.

TSENS_DAC_L2
offset = 0, measure range: -10°C ~ 80°C, error < 1°C.

TSENS_DAC_L3
offset = 1, measure range: -30°C ~ 50°C, error < 2°C.

TSENS_DAC_L4
offset = 2, measure range: -40°C ~ 20°C, error < 3°C.

TSENS_DAC_MAX
TSENS_DAC_DEFAULT = TSENS_DAC_L2

2.3.19 Timer

[]
Introduction

The ESP32 chip contains two hardware timer groups. Each group has two general-purpose hardware timers. They are all 64-bit generic timers based on 16-bit prescalers and 64-bit up / down counters which are capable of being auto-reloaded.

Functional Overview

The following sections of this document cover the typical steps to configure and operate a timer:

- **Timer Initialization** - covers which parameters should be set up to get the timer working, and also what specific functionality is provided depending on the timer configuration.

- **Timer Control** - describes how to read a timer’s value, pause or start a timer, and change how it operates.

- **Alarms** - shows how to set and use alarms.

- **Interrupts** - explains how to enable and use interrupts.

Timer Initialization

The two ESP32 timer groups, with two timers in each, provide the total of four individual timers for use. An ESP32 timer group should be identified using `timer_group_t`. An individual timer in a group should be identified with `timer_idx_t`.

First of all, the timer should be initialized by calling the function `timer_init()` and passing a structure `timer_config_t` to it to define how the timer should operate. In particular, the following timer parameters can be set:

- **Divider**: Sets how quickly the timer’s counter is “ticking”. The setting `divider` is used as a divisor of the incoming 80 MHz APB_CLK clock.

- **Mode**: Sets if the counter should be incrementing or decrementing. It can be defined using `counter_dir` by selecting one of the values from `timer_count_dir_t`.

- **Counter Enable**: If the counter is enabled, it will start incrementing / decrementing immediately after calling `timer_init()`. You can change the behavior with `counter_en` by selecting one of the values from `timer_start_t`.

- **Alarm Enable**: Can be set using `alarm_en`.

- **Auto Reload**: Sets if the counter should `auto_reload` the initial counter value on the timer’s alarm or continue incrementing or decrementing.

- **Interrupt Type**: Select which interrupt type should be triggered on the timer’s alarm. Set the value defined in `timer_intr_mode_t`.

To get the current values of the timer’s settings, use the function `timer_get_config()`.

Timer Control

Once the timer is enabled, its counter starts running. To enable the timer, call the function `timer_init()` with `counter_en` set to `true`, or call `timer_start()`. You can specify the timer’s initial counter value by calling `timer_set_counter_value()`. To check the timer’s current value, call `timer_get_counter_value()` or `timer_get_counter_time_sec()`.

To pause the timer at any time, call `timer_pause()`. To resume it, call `timer_start()`.
To reconfigure the timer, you can call `timer_init()`. This function is described in Section *Timer Initialization*.

You can also reconfigure the timer by using dedicated functions to change individual settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Dedicated Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Divider</td>
<td><code>timer_set_divider()</code></td>
<td>Change the rate of ticking. To avoid unpredictable results, the timer should be paused when changing the divider. If the timer is running, <code>timer_set_divider()</code> pauses it, change the setting, and start the timer again.</td>
</tr>
<tr>
<td>Mode</td>
<td><code>timer_set_counter_mode()</code></td>
<td>Set if the counter should be incrementing or decrementing</td>
</tr>
<tr>
<td>Auto Reload</td>
<td><code>timer_set_auto_reload()</code></td>
<td>Set if the initial counter value should be reloaded on the timer’s alarm</td>
</tr>
</tbody>
</table>

**Alarms**

To set an alarm, call the function `timer_set_alarm_value()` and then enable the alarm using `timer_set_alarm()`. The alarm can also be enabled during the timer initialization stage, when `timer_init()` is called.

After the alarm is enabled, and the timer reaches the alarm value, the following two actions can occur depending on the configuration:

- An interrupt will be triggered if previously configured. See Section *Interrupts* on how to configure interrupts.
- When `auto_reload` is enabled, the timer’s counter will automatically be reloaded to start counting again from a previously configured value. This value should be set in advance with `timer_set_counter_value()`.

**Note:**

- If an alarm value is set and the timer has already reached this value, the alarm is triggered immediately.
- Once triggered, the alarm is disabled automatically and needs to be re-enabled to trigger again.

To check the specified alarm value, call `timer_get_alarm_value()`.

**Interrupts**

Registration of the interrupt handler for a specific timer or a timer group can be done by calling `timer_isr_register()`.

To enable interrupts for a timer group, call `timer_group_intr_enable()`, for a specific timer call `timer_enable_intr()`. To disable interrupts for a timer group, call `timer_group_intr_disable()`, for a specified timer, call `timer_disable_intr()`.

When handling an interrupt within an interrupt service routine (ISR), the interrupt status bit needs to be explicitly cleared. To do that, set the `TIMERGN.int_clr_timers.tM` structure, defined in `soc/esp32/include/soc/timer_group_struct.h`. In this structure, `N` is the timer group number [0, 1], `M` is the timer number [0, 1]. For example, to clear an interrupt status bit for the timer 1 in the timer group 0, call the following:

```
TIMERO0.int_clr_timers.t1 = 1
```

For more information on how to use interrupts, please see the application example below.
Application Example

The 64-bit hardware timer example: peripherals/timer_group.

API Reference

Header File

- driver/include/driver/timer.h

Functions

`esp_err_t timer_get_counter_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t *timer_val)`

Read the counter value of hardware timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- timer_val: Pointer to accept timer counter value.

`esp_err_t timer_get_counter_time_sec(timer_group_t group_num, timer_idx_t timer_num, double *time)`

Read the counter value of hardware timer, in unit of a given scale.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- time: Pointer, type of double*, to accept timer counter value, in seconds.

`esp_err_t timer_set_counter_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t load_val)`

Set counter value to hardware timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- load_val: Counter value to write to the hardware timer.

```c
esp_err_t timer_start (timer_group_t group_num, timer_idx_t timer_num)
```

Start the counter of hardware timer.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

```c
esp_err_t timer_pause (timer_group_t group_num, timer_idx_t timer_num)
```

Pause the counter of hardware timer.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

```c
esp_err_t timer_set_counter_mode (timer_group_t group_num, timer_idx_t timer_num, timer_count_dir_t counter_dir)
```

Set counting mode for hardware timer.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- counter_dir: Counting direction of timer, count-up or count-down

```c
esp_err_t timer_set_auto_reload (timer_group_t group_num, timer_idx_t timer_num, timer_autoreload_t reload)
```

Enable or disable counter reload function when alarm event occurs.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

2.3. Peripherals API
• timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
• reload: Counter reload mode.

```c
esp_err_t timer_set_divider(timer_group_t group_num, timer_idx_t timer_num, uint32_t divider)
```

Set hardware timer source clock divider. Timer groups clock are divider from APB clock.

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**

• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
• divider: Timer clock divider value. The divider’s range is from 2 to 65536.

```c
esp_err_t timer_set_alarm_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t alarm_value)
```

Set timer alarm value.

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**

• group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
• alarm_value: A 64-bit value to set the alarm value.

```c
esp_err_t timer_get_alarm_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t *alarm_value)
```

Get timer alarm value.

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**

• group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
• alarm_value: Pointer of A 64-bit value to accept the alarm value.

```c
esp_err_t timer_set_alarm(timer_group_t group_num, timer_idx_t timer_num, timer_alarm_t alarm_en)
```

Enable or disable generation of timer alarm events.

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group number
• timer_num: Timer index of timer group
• isr_handler: Interrupt handler function, it is a callback function.
• arg: Parameter for handler function
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

If the intr_alloc_flags value ESP_INTR_FLAG_IRAM is set, the handler function must be declared with IRAM_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Add ISR handle callback for the corresponding timer.

Parameters
• group_num: Timer group number
• timer_num: Timer index of timer group
• isr_handler: Interrupt handler function, it is a callback function.
• arg: Parameter for handler function
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

If the intr_alloc_flags value ESP_INTR_FLAG_IRAM is set, the handler function must be declared with IRAM_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs.

Remove ISR handle callback for the corresponding timer.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group number
• timer_num: Timer index of timer group

Register Timer interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

If the intr_alloc_flags value ESP_INTR_FLAG_IRAM is set, the handler function must be declared with IRAM_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs. Use direct register access to configure timers from inside the ISR in this case.
Note If use this function to register ISR, you need to write the whole ISR. In the interrupt handler, you need to call timer_spinlock_take(..) before your handling, and call timer_spinlock_give(..) after your handling.

Parameters
- group_num: Timer group number
- timer_num: Timer index of timer group
- fn: Interrupt handler function.
- arg: Parameter for handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```
esp_err_t timer_init (timer_group_t group_num, timer_idx_t timer_num, const timer_config_t *config)
```

Initializes and configure the timer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- config: Pointer to timer initialization parameters.

```
esp_err_t timer_deinit (timer_group_t group_num, timer_idx_t timer_num)
```

Deinitializes the timer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

```
esp_err_t timer_get_config (timer_group_t group_num, timer_idx_t timer_num, timer_config_t *config)
```

Get timer configure value.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Parameters

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- `config`: Pointer of struct to accept timer parameters.

```c
esp_err_t timer_group_intr_enable(timer_group_t group_num, timer_intr_t intr_mask)
```
Enable timer group interrupt, by enable mask.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `intr_mask`: Timer interrupt enable mask.
  - TIMER_INTR_T0: t0 interrupt
  - TIMER_INTR_T1: t1 interrupt
  - TIMER_INTR_WDT: watchdog interrupt

```c
esp_err_t timer_group_intr_disable(timer_group_t group_num, timer_intr_t intr_mask)
```
Disable timer group interrupt, by disable mask.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `intr_mask`: Timer interrupt disable mask.
  - TIMER_INTR_T0: t0 interrupt
  - TIMER_INTR_T1: t1 interrupt
  - TIMER_INTR_WDT: watchdog interrupt

```c
esp_err_t timer_enable_intr(timer_group_t group_num, timer_idx_t timer_num)
```
Enable timer interrupt.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.
esp_err_t timer_disable_intr(timer_group_t group_num, timer_idx_t timer_num)

Disable timer interrupt.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.

void timer_group_intr_clr_in_isr(timer_group_t group_num, timer_idx_t timer_num)

Clear timer interrupt status, just used in ISR.

Return

• None

Parameters

• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.

void timer_group_clr_intr_status_in_isr(timer_group_t group_num, timer_idx_t timer_num)

Clear timer interrupt status, just used in ISR.

Return

• None

Parameters

• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.

void timer_group_enable_alarm_in_isr(timer_group_t group_num, timer_idx_t timer_num)

Enable alarm interrupt, just used in ISR.

Return

• None

Parameters

• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.

uint64_t timer_group_get_counter_value_in_isr(timer_group_t group_num, timer_idx_t timer_num)

Get the current counter value, just used in ISR.

Return

• Counter value

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.

void timer_group_set_alarm_value_in_isr(timer_group_t group_num, timer_idx_t timer_num, uint64_t alarm_val)
Set the alarm threshold for the timer, just used in ISR.

Return
• None

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.
• alarm_val: Alarm threshold.

void timer_group_set_counter_enable_in_isr(timer_group_t group_num, timer_idx_t timer_num, timer_start_t counter_en)
Enable/disable a counter, just used in ISR.

Return
• None

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.
• counter_en: Enable/disable.

timer_intr_t timer_group_intr_get_in_isr(timer_group_t group_num)
Get the masked interrupt status, just used in ISR.

Return
• Interrupt status

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

uint32_t timer_group_get_intr_status_in_isr(timer_group_t group_num)
Get interrupt status, just used in ISR.

Return
• Interrupt status

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

void timer_group_clr_intr_sta_in_isr(timer_group_t group_num, timer_intr_t intr_mask)
Clear the masked interrupt status, just used in ISR.

Return
• None

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• intr_mask: Masked interrupt.

`bool timer_group_get_auto_reload_in_isr(timer_group_t group_num, timer_idx_t timer_num)`
Get auto reload enable status, just used in ISR.

Return
• True Auto reload enabled
• False Auto reload disabled

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index

`esp_err_t timer_spinlock_take(timer_group_t group_num)`
Take timer spinlock to enter critical protect.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

`esp_err_t timer_spinlock_give(timer_group_t group_num)`
Give timer spinlock to exit critical protect.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

Macros

`TIMER_BASE_CLK`
Frequency of the clock on the input of the timer groups

Type Definitions

`typedef bool (*timer_isr_t)(void *)`
Interrupt handle callback function. User need to retrun a bool value in callback.
• True Do task yield at the end of ISR
• False Not do task yield at the end of ISR

**Note** If you called FreeRTOS functions in callback, you need to return true or false based on the return value of argument `pxHigherPriorityTaskWoken`. For example, `xQueueSendFromISR` is called in callback, if the return value `pxHigherPriorityTaskWoken` of any FreeRTOS calls is `pdTRUE`, return true; otherwise return false.

typedef `intr_handle_t timer_isr_handle_t`

Interrupt handle, used in order to free the isr after use. Aliases to an int handle for now.

**Header File**

- `soc/include/hal/timer_types.h`

**Structures**

```c
struct timer_config_t
```

Data structure with timer’s configuration settings.

**Public Members**

- `timer_alarm_t alarm_en`
  Timer alarm enable
- `timer_start_t counter_en`
  Counter enable
- `timer_intr_mode_t intr_type`
  Interrupt mode
- `timer_count_dir_t counter_dir`
  Counter direction
- `timer_autoreload_t auto_reload`
  Timer auto-reload
- `uint32_t divider`
  Counter clock divider. The divider’s range is from 2 to 65536.

**Enumerations**

```c
enum timer_group_t
```

Selects a Timer-Group out of 2 available groups.

**Values:**

- `TIMER_GROUP_0 = 0`
  Hw timer group 0
- `TIMER_GROUP_1 = 1`
  Hw timer group 1
- `TIMER_GROUP_MAX`
enum timer_idx_t
Select a hardware timer from timer groups.

Values:

    TIMER_0 = 0
    Select timer0 of GROUPx

    TIMER_1 = 1
    Select timer1 of GROUPx

    TIMER_MAX

enum timer_count_dir_t
Decides the direction of counter.

Values:

    TIMER_COUNT_DOWN = 0
    Descending Count from cnt.high|cnt.low

    TIMER_COUNT_UP = 1
    Ascending Count from Zero

    TIMER_COUNT_MAX

enum timer_start_t
Decides whether timer is on or paused.

Values:

    TIMER_PAUSE = 0
    Pause timer counter

    TIMER_START = 1
    Start timer counter

enum timer_intr_t
Interrupt types of the timer.

Values:

    TIMER_INTR_T0 = BIT(0)
    interrupt of timer 0

    TIMER_INTR_T1 = BIT(1)
    interrupt of timer 1

    TIMER_INTR_WDT = BIT(2)
    interrupt of watchdog

    TIMER_INTR_NONE = 0

enum timer_wdt_behavior_t
Behavior of the watchdog if a stage times out.

Values:

    TIMER_WDT_OFF = 0
    The stage is turned off

    TIMER_WDT_INT = 1
    The stage will trigger an interrupt

    TIMER_WDT_RESET_CPU = 2
    The stage will reset the CPU
The stage will reset the whole system

```c
enum timer_alarm_t
```
Decides whether to enable alarm mode.

Values:

- `TIMER_ALARM_DIS = 0`
  - Disable timer alarm
- `TIMER_ALARM_EN = 1`
  - Enable timer alarm

```c
enum timer_intr_mode_t
```
Select interrupt type if running in alarm mode.

Values:

- `TIMER_INTR_LEVEL = 0`
  - Interrupt mode: level mode
- `TIMER_INTR_MAX`

```c
enum timer_autoreload_t
```
Select if Alarm needs to be loaded by software or automatically reload by hardware.

Values:

- `TIMER_AUTORELOAD_DIS = 0`
  - Disable auto-reload: hardware will not load counter value after an alarm event
- `TIMER_AUTORELOAD_EN = 1`
  - Enable auto-reload: hardware will load counter value after an alarm event

### 2.3.20 Touch Sensor

**Introduction**

A touch sensor system is built on a substrate which carries electrodes and relevant connections under a protective flat surface. When a user touches the surface, the capacitance variation is used to evaluate if the touch was valid.

ESP32 can handle up to 10 capacitive touch pads / GPIOs. The sensing pads can be arranged in different combinations (e.g., matrix, slider), so that a larger area or more points can be detected. The touch pad sensing process is under the control of a hardware-implemented finite-state machine (FSM) which is initiated by software or a dedicated hardware timer.

Design, operation, and control registers of a touch sensor are discussed in ESP32 Technical Reference Manual (PDF). Please refer to this manual for additional details on how this subsystem works.

In-depth design details of touch sensors and firmware development guidelines for ESP32 are available in Touch Sensor Application Note. If you want to test touch sensors in various configurations without building them on your own, check the Guide for ESP32-Sense Development Kit.
Functionality Overview

Description of API is broken down into groups of functions to provide a quick overview of the following features:

- Initialization of touch pad driver
- Configuration of touch pad GPIO pins
- Taking measurements
- Adjusting parameters of measurements
- Filtering measurements
- Touch detection methods
- Setting up interrupts to report touch detection
- Waking up from Sleep mode on interrupt

For detailed description of a particular function, please go to Section API Reference. Practical implementation of this API is covered in Section Application Examples.

Initialization

Before using a touch pad, you need to initialize the touch pad driver by calling the function touch_pad_init(). This function sets several .._DEFAULT driver parameters listed in API Reference under Macros. It also removes the information about which pads have been touched before, if any, and disables interrupts.

If the driver is not required anymore, deinitialize it by calling touch_pad_deinit().

Configuration

Enabling the touch sensor functionality for a particular GPIO is done with touch_pad_config().

Use the function touch_pad_set_fsm_mode() to select if touch pad measurement (operated by FSM) should be started automatically by a hardware timer, or by software. If software mode is selected, use touch_pad_sw_start() to start the FSM.

Touch State Measurements

The following two functions come in handy to read raw or filtered measurements from the sensor:

- touch_pad_read()
- touch_pad_read_filtered()

They can also be used, for example, to evaluate a particular touch pad design by checking the range of sensor readings when a pad is touched or released. This information can be then used to establish a touch threshold.

Note: Before using touch_pad_read_filtered(), you need to initialize and configure the filter by calling specific filter functions described in Section Filtering of Measurements.

For the demonstration of how to use both read functions, check the application example peripherals/touch_pad_read.
Optimization of Measurements

A touch sensor has several configurable parameters to match the characteristics of a particular touch pad design. For instance, to sense smaller capacity changes, it is possible to narrow down the reference voltage range within which the touch pads are charged / discharged. The high and low reference voltages are set using the function `touch_pad_set_voltage()`.

Besides the ability to discern smaller capacity changes, a positive side effect is reduction of power consumption for low power applications. A likely negative effect is an increase in measurement noise. If the dynamic range of obtained readings is still satisfactory, then further reduction of power consumption might be done by reducing the measurement time with `touch_pad_set_meas_time()`.

The following list summarizes available measurement parameters and corresponding 'set' functions:

- Touch pad charge / discharge parameters:
  - voltage range: `touch_pad_set_voltage()`
  - speed (slope): `touch_pad_set_cnt_mode()`

- Measurement time: `touch_pad_set_meas_time()`

Relationship between the voltage range (high / low reference voltages), speed (slope), and measurement time is shown in the figure below.

![Fig. 22: Touch pad - relationship between measurement parameters](image)

The last chart *Output* represents the touch sensor reading, i.e., the count of pulses collected within the measurement time.

All functions are provided in pairs to set a specific parameter and to get the current parameter’s value, e.g., `touch_pad_set_voltage()` and `touch_pad_get_voltage()`.

2.3. Peripherals API
Filtering of Measurements

If measurements are noisy, you can filter them with provided API functions. Before using the filter, please start it by calling `touch_pad_filter_start()`.

The filter type is IIR (infinite impulse response), and it has a configurable period that can be set with the function `touch_pad_set_filter_period()`.

You can stop the filter with `touch_pad_filter_stop()`. If not required anymore, the filter can be deleted by invoking `touch_pad_filter_delete()`.

Touch Detection

Touch detection is implemented in ESP32’s hardware based on the user-configured threshold and raw measurements executed by FSM. Use the functions `touch_pad_get_status()` to check which pads have been touched and `touch_pad_clear_status()` to clear the touch status information.

Hardware touch detection can also be wired to interrupts. This is described in the next section.

If measurements are noisy and capacity changes are small, hardware touch detection might be unreliable. To resolve this issue, instead of using hardware detection / provided interrupts, implement measurement filtering and perform touch detection in your own application. For sample implementation of both methods of touch detection, see peripherals/touch_pad_interrupt.

Touch Triggered Interrupts

Before enabling an interrupt on a touch detection, you should establish a touch detection threshold. Use the functions described in `Touch State Measurements` to read and display sensor measurements when a pad is touched and released. Apply a filter if measurements are noisy and relative capacity changes are small. Depending on your application and environment conditions, test the influence of temperature and power supply voltage changes on measured values.

Once a detection threshold is established, it can be set during initialization with `touch_pad_config()` or at the runtime with `touch_pad_set_thresh()`.

In the next step, configure how interrupts are triggered. They can be triggered below or above the threshold, which is set with the function `touch_pad_set_trigger_mode()`.

Finally, configure and manage interrupt calls using the following functions:

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`

When interrupts are operational, you can obtain the information from which particular pad an interrupt came by invoking `touch_pad_get_status()` and clear the pad status with `touch_pad_clear_status()`.

**Note:** Interrupts on touch detection operate on raw / unfiltered measurements checked against user established threshold and are implemented in hardware. Enabling the software filtering API (see Filtering of Measurements) does not affect this process.

Wakeup from Sleep Mode

If touch pad interrupts are used to wake up the chip from a sleep mode, you can select a certain configuration of pads (SET1 or both SET1 and SET2) that should be touched to trigger the interrupt and cause the subsequent wakeup. To
do so, use the function `touch_pad_set_trigger_source()`.

Configuration of required bit patterns of pads may be managed for each 'SET' with:

- `touch_pad_set_group_mask()` / `touch_pad_get_group_mask()`
- `touch_pad_clear_group_mask()`

**Application Examples**

- Touch sensor read example: `peripherals/touch_pad_read`.
- Touch sensor interrupt example: `peripherals/touch_pad_interrupt`.

**API Reference**

**Header File**

- `driver/include/driver/touch_pad.h`

**GPIO Lookup Macros**

Some useful macros can be used to specified the GPIO number of a touch pad channel, or vice versa. E.g.

1. `TOUCH_PAD_NUM5_GPIO_NUM` is the GPIO number of channel 5 (12);
2. `TOUCH_PAD_GPIO4_CHANNEL` is the channel number of GPIO 4 (channel 0).

**Header File**

- `soc/esp32/include/soc/touch_sensor_channel.h`

**Macros**

- `TOUCH_PAD_GPIO4_CHANNEL`
- `TOUCH_PAD_NUM0_GPIO_NUM`
- `TOUCH_PAD_GPIO0_CHANNEL`
- `TOUCH_PAD_NUM1_GPIO_NUM`
- `TOUCH_PAD_GPIO2_CHANNEL`
- `TOUCH_PAD_NUM2_GPIO_NUM`
- `TOUCH_PAD_GPIO15_CHANNEL`
- `TOUCH_PAD_NUM3_GPIO_NUM`
- `TOUCH_PAD_GPIO13_CHANNEL`
- `TOUCH_PAD_NUM4_GPIO_NUM`
- `TOUCH_PAD_GPIO12_CHANNEL`
- `TOUCH_PAD_NUM5_GPIO_NUM`
 TOUCH_PAD_GPIO14_CHANNEL
 TOUCH_PAD_NUM6_GPIO_NUM
 TOUCH_PAD_GPIO27_CHANNEL
 TOUCH_PAD_NUM7_GPIO_NUM
 TOUCH_PAD_GPIO33_CHANNEL
 TOUCH_PAD_NUM8_GPIO_NUM
 TOUCH_PAD_GPIO32_CHANNEL
 TOUCH_PAD_NUM9_GPIO_NUM

Header File

- soc/include/hal/touch_sensor_types.h

Macros

TOUCH_PAD_SLOPE_DEFAULT
TOUCH_PAD_TIE_OPT_DEFAULT
TOUCH_PAD_BIT_MASK_MAX
TOUCH_PAD_HIGH_VOLTAGE_THRESHOLD
TOUCH_PAD_LOW_VOLTAGE_THRESHOLD
TOUCH_PAD_ATTEN_VOLTAGE_THRESHOLD
TOUCH_PAD_INACTIVE_CONNECT_DEFAULT

TOUCH_PAD_THRESHOLD_MAX
If set touch threshold max value, The touch sensor can’t be in touched status

Enumerations

enum touch_pad_t
Values:

 TOUCH_PAD_NUM0 = 0
  Touch pad channel 0 is GPIO4(ESP32)

 TOUCH_PAD_NUM1
  Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)

 TOUCH_PAD_NUM2
  Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

 TOUCH_PAD_NUM3
  Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

 TOUCH_PAD_NUM4
  Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)

 TOUCH_PAD_NUM5
  Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)
**TOUCH_PAD_NUM6**
- Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

**TOUCH_PAD_NUM7**
- Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

**TOUCH_PAD_NUM8**
- Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

**TOUCH_PAD_NUM9**
- Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

**TOUCH_PAD_MAX**

```c
enum touch_high_volt_t
{
    TOUCH_HVOLT_KEEP = -1
    , Touch sensor high reference voltage, no change
    TOUCH_HVOLT_2V4 = 0
    , Touch sensor high reference voltage, 2.4V
    TOUCH_HVOLT_2V5
    , Touch sensor high reference voltage, 2.5V
    TOUCH_HVOLT_2V6
    , Touch sensor high reference voltage, 2.6V
    TOUCH_HVOLT_2V7
    , Touch sensor high reference voltage, 2.7V
    TOUCH_HVOLT_MAX

enum touch_low_volt_t
{
    TOUCH_LVOLT_KEEP = -1
    , Touch sensor low reference voltage, no change
    TOUCH_LVOLT_0V5 = 0
    , Touch sensor low reference voltage, 0.5V
    TOUCH_LVOLT_0V6
    , Touch sensor low reference voltage, 0.6V
    TOUCH_LVOLT_0V7
    , Touch sensor low reference voltage, 0.7V
    TOUCH_LVOLT_0V8
    , Touch sensor low reference voltage, 0.8V
    TOUCH_LVOLT_MAX

enum touch_volt_atten_t
{
    TOUCH_HVOLT_ATTEN_KEEP = -1
    , Touch sensor high reference voltage attenuation, no change
    TOUCH_HVOLT_ATTEN_1V5 = 0
    , Touch sensor high reference voltage attenuation, 1.5V attenuation
    TOUCH_HVOLT_ATTEN_1V
    , Touch sensor high reference voltage attenuation, 1.0V attenuation
```

**2.3. Peripherals API**
**TOUCH_HVOLT_ATTEN_0V5**
Touch sensor high reference voltage attenuation, 0.5V attenuation

**TOUCH_HVOLT_ATTEN_0V**
Touch sensor high reference voltage attenuation, 0V attenuation

**TOUCH_HVOLT_ATTEN_MAX**

```c
enum touch_cnt_slope_t
Values:

TOUCH_PAD_SLOPE_0 = 0
    Touch sensor charge / discharge speed, always zero

TOUCH_PAD_SLOPE_1 = 1
    Touch sensor charge / discharge speed, slowest

TOUCH_PAD_SLOPE_2 = 2
    Touch sensor charge / discharge speed

TOUCH_PAD_SLOPE_3 = 3
    Touch sensor charge / discharge speed

TOUCH_PAD_SLOPE_4 = 4
    Touch sensor charge / discharge speed

TOUCH_PAD_SLOPE_5 = 5
    Touch sensor charge / discharge speed

TOUCH_PAD_SLOPE_6 = 6
    Touch sensor charge / discharge speed

TOUCH_PAD_SLOPE_7 = 7
    Touch sensor charge / discharge speed, fast

TOUCH_PAD_SLOPE_MAX
```

**enum touch_tie_opt_t**

```c
enum touch_tie_opt_t
Values:

TOUCH_PAD_TIE_OPT_LOW = 0
    Initial level of charging voltage, low level

TOUCH_PAD_TIE_OPT_HIGH = 1
    Initial level of charging voltage, high level

TOUCH_PAD_TIE_OPT_MAX
```

**enum touch_fsm_mode_t**

```c
touch_fsm_mode_t
Values:

TOUCH_FSM_MODE_TIMER = 0
    To start touch FSM by timer

TOUCH_FSM_MODE_SW
    To start touch FSM by software trigger

TOUCH_FSM_MODE_MAX
```

**enum touch_trigger_mode_t**

```c
touch_trigger_mode_t
Values:

TOUCH_TRIGGER_BELOW = 0
    Touch interrupt will happen if counter value is less than threshold.
```

**Chapter 2. API Reference**

---

**Read the Docs Template Documentation, Release v4.1**
TOUCH_TRIGGER_ABOVE = 1
    Touch interrupt will happen if counter value is larger than threshold.

TOUCH_TRIGGER_MAX

touch_trigger_src_t

Values:

TOUCH_TRIGGER_SOURCE_BOTH = 0
    wakeup interrupt is generated if both SET1 and SET2 are “touched”

TOUCH_TRIGGER_SOURCE_SET1 = 1
    wakeup interrupt is generated if SET1 is “touched”

TOUCH_TRIGGER_SOURCE_MAX

2.3.21 UART

Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e.,
timing requirements and data framing) using widely-adapted asynchronous serial communication interfaces, such as
RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex
data exchange among different devices.

The ESP32 chip has three UART controllers (UART0, UART1, and UART2) that feature an identical set of registers
for ease of programming and flexibility. Each UART controller is independently configurable with parameters such
as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with
UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

Functional Overview

The following overview describes how to establish communication between an ESP32 and other UART devices using
the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken
down into the sections provided below:

1. Setting Communication Parameters - Setting baud rate, data bits, stop bits, etc.
2. Setting Communication Pins - Assigning pins for connection to a device.
3. Driver Installation - Allocating ESP32’s resources for the UART driver.
4. Running UART Communication - Sending / receiving data
5. Using Interrupts - Triggering interrupts on specific communication events
6. Deleting a Driver - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.
The UART driver’s functions identify each of the three UART controllers using uart_port_t. This identification
is needed for all the following function calls.

Setting Communication Parameters

UART communication parameters can be configured all in a single step or individually in multiple steps.
Single Step

Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```c
const int uart_num = UART_NUM_2;
uart_config_tuart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

Multiple Steps

Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

<table>
<thead>
<tr>
<th>Parameter to Configure</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baud rate</td>
<td><code>uart_set_baudrate()</code></td>
</tr>
<tr>
<td>Number of transmitted bits</td>
<td><code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code></td>
</tr>
<tr>
<td>Parity control</td>
<td><code>uart_set_parity()</code> selected out of <code>uart_parity_t</code></td>
</tr>
<tr>
<td>Number of stop bits</td>
<td><code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code></td>
</tr>
<tr>
<td>Hardware flow control mode</td>
<td><code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code></td>
</tr>
<tr>
<td>Communication mode</td>
<td><code>uart_set_mode()</code> selected out of <code>uart_mode_t</code></td>
</tr>
</tbody>
</table>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

Setting Communication Pins

After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro should be specified for pins that will not be used.

```c
// Set UART pins(TX: IO16 (UART2 default), RX: IO17 (UART2 default), RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, UART_PIN_NO_CHANGE, UART_PIN_NO_CHANGE, 18, UART_PIN_NO_CHANGE, 19));
```
Driver Installation

Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required ESP32 resources for the UART driver.

```c
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, 
                                     uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

Running UART Communication

Serial communication is controlled by each UART controller’s finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

Transmitting

After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer’s address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```c
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```
The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the Tx line low for a period longer than one data frame.

```c
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```c
// Wait for packet to be sent
const int uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS ticks
```

### Receiving

Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```c
// Read data from UART.
const int uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

### Software Flow Control

If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

### Communication Mode Selection

The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```c
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```
Using Interrupts

There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in ESP32 Technical Reference Manual (PDF). You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively. The mask of all interrupts is available as `UART_INTR_MASK`.

By default, the `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below). It is also possible to register a lower level interrupt handler instead using `uart_isr_register()`, and to free it again using `uart_isr_free()`. Some UART driver functions which use the Tx and Rx ring buffers, events, etc. will not automatically work in this case - it is necessary to handle the interrupts directly in the ISR. Inside the custom handler implementation, clear the interrupt status bits using `uart_clear_intr_status()`.

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection**: There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in Driver Installation. An example of using Event detection can be found in peripherals/uart_events.

- **FIFO space threshold or transmission timeout reached**: The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`

- **Pattern detection**: An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example peripherals/uart/uart_events. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the ‘pattern’) added at the end of the command string. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_intr()`
  - Disable the interrupt using `uart_disable_pattern_det_intr()`

Macros

The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

Deleting a Driver

If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.
Overview of RS485 specific communication options

Note: The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. To find more information on a specific option bit, open Register Summary in the ESP32 Technical Reference Manual (PDF), use the register name to navigate to the register description and then find the field/bit.

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section Interface Connection Options). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32’s UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the ~RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

Interface Connection Options

This section provides example schematics to demonstrate the basic aspects of ESP32’s RS485 interface connection.

Note:

- The schematics below do **not** necessarily contain all required elements.
- The analog devices ADM483 & ADM2483 are examples of common RS485 transceivers and can be replaced with other similar transceivers.
Circuit A: Collision Detection Circuit

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the ESP32 hardware when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is enabled.

Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is set. The bit UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN is not applicable in this case.

Circuit C: Auto Switching Transmitter/Receiver

(continues on next page)
This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting \texttt{UART\_RS485\_CONF\_REG.UART\_RS485\_RXBY\_TX\_EN} to 1 and \texttt{UART\_RS485\_CONF\_REG.UART\_RS485\_TX\_RX\_EN} to 0. This setup can work in any RS485 UART mode or even in \texttt{UART\_MODE\_UART}.

### Application Examples

The table below describes the code examples available in the directory \texttt{peripherals/uart/}.

<table>
<thead>
<tr>
<th>Code Example</th>
<th>Description</th>

### API Reference

#### Header File
- \texttt{driver/include/driver/uart.h}

#### Functions

`esp_err_t uart_driver_install (uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)`

Install UART driver and set the UART to the default configuration.

- UART ISR handler will be attached to the same CPU core that this function is running on.

**Note** Rx\_buffer\_size should be greater than UART\_FIFO\_LEN. Tx\_buffer\_size should be either zero or greater than UART\_FIFO\_LEN.
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• rx_buffer_size: UART RX ring buffer size.
• tx_buffer_size: UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
• queue_size: UART event queue size/depth.
• uart_queue: UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver’s ISR handler is not located in IRAM)

esp_err_t uart_driver_delete(uart_port_t uart_num)
Uninstall UART driver.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

bool uart_is_driver_installed(uart_port_t uart_num)
Checks whether the driver is installed or not.

Return
• true driver is installed
• false driver is not installed

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

esp_err_t uart_set_word_length(uart_port_t uart_num, uart_word_length_t data_bit)
Set UART data bits.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• data_bit: UART data bits
**esp_err_t uart_get_word_length(uart_port_t uart_num, uart_word_length_t *data_bit)**
Get the UART data bit configuration.

**Return**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- data_bit: Pointer to accept value of UART data bits.

**esp_err_t uart_set_stop_bits(uart_port_t uart_num, uart_stop_bits_t stop_bits)**
Set UART stop bits.

**Return**
- ESP_OK Success
- ESP_FAIL Fail

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- stop_bits: UART stop bits

**esp_err_t uart_get_stop_bits(uart_port_t uart_num, uart_stop_bits_t *stop_bits)**
Get the UART stop bit configuration.

**Return**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bit)

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- stop_bits: Pointer to accept value of UART stop bits.

**esp_err_t uart_set_parity(uart_port_t uart_num, uart_parity_t parity_mode)**
Set UART parity mode.

**Return**
- ESP_FAIL Parameter error
- ESP_OK Success

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- parity_mode: the enum of uart parity configuration

**esp_err_t uart_get_parity(uart_port_t uart_num, uart_parity_t *parity_mode)**
Get the UART parity mode configuration.

**Return**
• ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*parity_mode)

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• parity_mode: Pointer to accept value of UART parity mode.

```c
esp_err_t uart_set_baudrate(uart_port_t uart_num, uint32_t baudrate)
```
Set UART baud rate.

Return
• ESP_FAIL Parameter error
• ESP_OK Success

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• baudrate: UART baud rate.

```c
esp_err_t uart_get_baudrate(uart_port_t uart_num, uint32_t *baudrate)
```
Get the UART baud rate configuration.

Return
• ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*baudrate)

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• baudrate: Pointer to accept value of UART baud rate

```c
esp_err_t uart_set_line_inverse(uart_port_t uart_num, uint32_t inverse_mask)
```
Set UART line inverse mode.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• inverse_mask: Choose the wires that need to be inverted. Using the ORred mask of
  `uart_signal_inv_t`

```c
esp_err_t uart_set_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)
```
Set hardware flow control.

Return
• ESP_OK Success
• ESP_FAIL Parameter error
Parameters

- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).
- **flow_ctrl**: Hardware flow control mode
- **rx_thresh**: Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

```c
esp_err_t uart_set_sw_flow_ctrl(uart_port_t uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)
```
Set software flow control.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **enable**: switch on or off
- **rx_thresh_xon**: low water mark
- **rx_thresh_xoff**: high water mark

```c
esp_err_t uart_get_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t *flow_ctrl)
```
Get the UART hardware flow control configuration.

Return

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl)

Parameters

- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).
- **flow_ctrl**: Option for different flow control mode.

```c
esp_err_t uart_clear_intr_status(uart_port_t uart_num, uint32_t clr_mask)
```
Clear UART interrupt status.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).
- **clr_mask**: Bit mask of the interrupt status to be cleared.

```c
esp_err_t uart_enable_intr_mask(uart_port_t uart_num, uint32_t enable_mask)
```
Set UART interrupt enable.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `enable_mask`: Bit mask of the enable bits.

```c
esp_err_t uart_enable_tx_intr(uart_port_t uart_num, int enable, int thresh)
```
Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Parameters
- `uart_num`: UART port number

```c
esp_err_t uart_disable_tx_intr(uart_port_t uart_num)
```
Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Parameters
- `uart_num`: UART port number

```c
esp_err_t uart_enable_rx_intr(uart_port_t uart_num)
```
Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Parameters
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).

```c
esp_err_t uart_disable_rx_intr(uart_port_t uart_num)
```
Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Parameters
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).

```c
esp_err_t uart_disable_intr_mask(uart_port_t uart_num, uint32_t disable_mask)
```
Clear UART interrupt enable bits.

Parameters
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `disable_mask`: Bit mask of the disable bits.
Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- enable: 1: enable; 0: disable
- thresh: Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

\[
\text{esp_err_t uart_isr_register} (\text{uart_port_t uart_num}, \text{void (*)fn}) \text{ void *arg, int intr_alloc_flags}, \text{uart_isr_handle_t *handle}
\]

Register UART interrupt handler (ISR).

Note UART ISR handler will be attached to the same CPU core that this function is running on.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- fn: Interrupt handler function.
- arg: parameter for handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

\[
\text{esp_err_t uart_isr_free} (\text{uart_port_t uart_num})
\]

Free UART interrupt handler registered by uart_isr_register. Must be called on the same core as uart_isr_register was called.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

\[
\text{esp_err_t uart_set_pin} (\text{uart_port_t uart_num}, \text{int tx_io_num}, \text{int rx_io_num}, \text{int rts_io_num}, \text{int cts_io_num})
\]

Set UART pin number.

Note Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

Note Instead of GPIO number a macro ‘UART_PIN_NO_CHANGE’ may be provided to keep the currently allocated pin.

Return

- ESP_OK Success
- ESP_FAIL Parameter error
Parameters

- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).
- **tx_io_num**: UART TX pin GPIO number.
- **rx_io_num**: UART RX pin GPIO number.
- **rts_io_num**: UART RTS pin GPIO number.
- **cts_io_num**: UART CTS pin GPIO number.

```c
esp_err_t uart_set_rts(uart_port_t uart_num, int level)
```
Manually set the UART RTS pin level.

**Note** UART must be configured with hardware flow control disabled.

**Return**

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).
- **level**: 1: RTS output low (active); 0: RTS output high (block)

```c
esp_err_t uart_set_dtr(uart_port_t uart_num, int level)
```
Manually set the UART DTR pin level.

**Return**

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).
- **level**: 1: DTR output low; 0: DTR output high

```c
esp_err_t uart_set_tx_idle_num(uart_port_t uart_num, uint16_t idle_num)
```
Set UART idle interval after tx FIFO is empty.

**Return**

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).
- **idle_num**: idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

```c
esp_err_t uart_param_config(uart_port_t uart_num, const uart_config_t *uart_config)
```
Set UART configuration parameters.

**Return**
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• uart_config: UART parameter settings

```
esp_err_t uart_intr_config(uart_port_t uart_num, const uart_intr_config_t *intr_conf)
```
Configure UART interrupts.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• intr_conf: UART interrupt settings

```
esp_err_t uart_wait_tx_done(uart_port_t uart_num, TickType_t ticks_to_wait)
```
Wait until UART TX FIFO is empty.

Return
• ESP_OK Success
• ESP_FAIL Parameter error
• ESP_ERR_TIMEOUT Timeout

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• ticks_to_wait: Timeout, count in RTOS ticks

```
int uart_tx_chars(uart_port_t uart_num, const char *buffer, uint32_t len)
```
Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

Note This function should only be used when UART TX buffer is not enabled.

Return
• (-1) Parameter error
• OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• buffer: data buffer address
• len: data length to send
int uart_write_bytes (uart_port_t uart_num, const char *src, size_t size)

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

Return

• (-1) Parameter error
• OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters

• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• src: data buffer address
• size: data length to send

int uart_write_bytes_with_break (uart_port_t uart_num, const char *src, size_t size, int brk_len)

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

Return

• (-1) Parameter error
• OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters

• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• src: data buffer address
• size: data length to send
• brk_len: break signal duration(unit: the time it takes to send one bit at current baudrate)

int uart_read_bytes (uart_port_t uart_num, uint8_t *buf, uint32_t length, TickType_t ticks_to_wait)

UART read bytes from UART buffer.

Return

• (-1) Error
• OTHERS (>=0) The number of bytes read from UART FIFO

Parameters

• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• buf: pointer to the buffer.
• length: data length
• ticks_to_wait: sTimeout, count in RTOS ticks
Esp_err_t uart_flush (uart_port_t uart_num)

Alias of uart_flush_input. UART ring buffer flush. This will discard all data in the UART RX buffer.

Note Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

Return

• ESP_OK Success
• ESP_FAIL Parameter error

Parameters

• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

Esp_err_t uart_flush_input (uart_port_t uart_num)

Clear input buffer, discard all the data is in the ring-buffer.

Note In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

Return

• ESP_OK Success
• ESP_FAIL Parameter error

Parameters

• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

Esp_err_t uart_get_buffered_data_len (uart_port_t uart_num, size_t *size)

UART get RX ring buffer cached data length.

Return

• ESP_OK Success
• ESP_FAIL Parameter error

Parameters

• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

• size: Pointer of size_t to accept cached data length

Esp_err_t uart_disable_pattern_det_intr (uart_port_t uart_num)

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

Return

• ESP_OK Success
• ESP_FAIL Parameter error

Parameters

• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

Esp_err_t uart_enable_pattern_det_baud_intr (uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.
Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- uart_num: UART port number.
- pattern_chr: character of the pattern.
- chr_num: number of the character, 8bit value.
- chr_tout: timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
- post_idle: idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char
- pre_idle: idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

int uart_pattern_pop_pos (uart_port_t uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Return

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

int uart_pattern_get_pos (uart_port_t uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function do nothing to the queue.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Return

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.
uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

`esp_err_t uart_pattern_queue_reset(uart_port_t uart_num, int queue_length)`

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

Return

- ESP_ERR_NO_MEM No enough memory
- ESP_ERR_INVALID_STATE Driver not installed
- ESP_FAIL Parameter error
- ESP_OK Success

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- queue_length: Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

`esp_err_t uart_set_mode(uart_port_t uart_num, uart_mode_t mode)`

UART set communication mode.

Note This function must be executed after uart_driver_install(), when the driver object is initialized.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- uart_num: Uart number to configure, the max port number is (UART_NUM_MAX -1).
- mode: UART UART mode to set

`esp_err_t uart_set_rx_full_threshold(uart_port_t uart_num, int threshold)`

Set uart threshold value for RX fifo full.

Note If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

Parameters

- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- threshold: Threshold value above which RX fifo full interrupt is generated

`esp_err_t uart_set_tx_empty_threshold(uart_port_t uart_num, int threshold)`

Set uart threshold values for TX fifo empty.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_INVALID_STATE Driver is not installed

Parameters
• uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
• threshold: Threshold value below which TX fifo empty interrupt is generated

```c
esp_err_t uart_set_rx_timeout(uart_port_t uart_num, const uint8_t tout_thresh)
```

UART set threshold timeout for TOUT feature.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_INVALID_STATE Driver is not installed

Parameters
• uart_num: Uart number to configure, the max port number is (UART_NUM_MAX -1).
• tout_thresh: This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

```c
esp_err_t uart_get_collision_flag(uart_port_t uart_num, bool *collision_flag)
```

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• uart_num: Uart number to configure the max port number is (UART_NUM_MAX -1).
• collision_flag: Pointer to variable of type bool to return collision flag.

```c
esp_err_t uart_set_wakeup_threshold(uart_port_t uart_num, int wakeup_threshold)
```

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters
and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF_TICK as UART clock source, by setting use_ref_tick field in uart_config_t to true.

**Note** in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.

**Parameters**
- uart_num: UART number, the max port number is (UART_NUM_MAX -1).
- wakeup_threshold: number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

```c
esp_err_t uart_get_wakeup_threshold(uart_port_t uart_num, int *out_wakeup_threshold)
```

Get the number of RX pin signal edges for light sleep wakeup.

See description of uart_set_wakeup_threshold for the explanation of UART wakeup feature.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if out_wakeup_threshold is NULL

**Parameters**
- uart_num: UART number, the max port number is (UART_NUM_MAX -1).
- out_wakeup_threshold: output, set to the current value of wakeup threshold for the given UART.

```c
esp_err_t uart_wait_tx_idle_polling(uart_port_t uart_num)
```

Wait until UART tx memory empty and the last char send ok (polling mode).

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

**Parameters**
- uart_num: UART number

```c
esp_err_t uart_set_loop_back(uart_port_t uart_num, bool loop_back_en)
```

Configure TX signal loop back to RX module, just for the test usage.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed
Parameters

- **uart_num**: UART number
- **loop_back_en**: Set true to enable the loop back function, else set it false.

Structures

```c
struct uart_intr_config_t
UART interrupt configuration parameters for uart_intr_config function.
```

**Public Members**

```c
uint32_t intr_enable_mask
UART interrupt enable mask, choose from UART_XXXX_INT_ENA_M under
UART_INT_ENA_REG(i), connect with bit-or operator
```

```c
uint8_t rx_timeout_thresh
UART timeout interrupt threshold (unit: time of sending one byte)
```

```c
uint8_t txfifo_empty_intr_thresh
UART TX empty interrupt threshold.
```

```c
uint8_t rxfifo_full_thresh
UART RX full interrupt threshold.
```

```c
struct uart_event_t
Event structure used in UART event queue.
```

**Public Members**

```c
uart_event_type_t type
UART event type
```

```c
size_t size
UART data size for UART_DATA event
```

Macros

```c
UART_NUM_0
UART port 0
```

```c
UART_NUM_1
UART port 1
```

```c
UART_NUM_MAX
UART port max
```

```c
UART_PIN_NO_CHANGE
Constant for uart_set_pin function which indicates that UART pin should not be changed
```

Type Definitions

```c
typedef intr_handle_t uart_isr_handle_t
```
Enumerations

define enum uart_event_type_t
    UART event types used in the ring buffer.
    Values:
    UART_DATA
        UART data event
    UART_BREAK
        UART break event
    UART_BUFFER_FULL
        UART RX buffer full event
    UART_FIFO_OVF
        UART FIFO overflow event
    UART_FRAME_ERR
        UART RX frame error event
    UART_PARITY_ERR
        UART RX parity event
    UART_DATA_BREAK
        UART TX data and break event
    UART_PATTERN_DET
        UART pattern detected
    UART_EVENT_MAX
        UART event max index

Header File

• soc/include/hal/uart_types.h

Structures

struct uart_at_cmd_t
    UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

Public Members

uint8_t cmd_char
    UART AT cmd char

uint8_t char_num
    AT cmd char repeat number

tuint32_t gap_tout
    gap time(in baud-rate) between AT cmd char

tuint32_t pre_idle
    the idle time(in baud-rate) between the non AT char and first AT char

```c
uint32_t post_idle
    the idle time(in baud-rate) between the last AT char and the none AT char
```

```c
struct uart_sw_flowctrl_t
    UART software flow control configuration parameters.
```

**Public Members**

```c
uint8_t xon_char
    Xon flow control char
```

```c
uint8_t xoff_char
    Xoff flow control char
```

```c
uint8_t xon_thrd
    If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent
```

```c
uint8_t xoff_thrd
    If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent
```

```c
struct uart_config_t
    UART configuration parameters for uart_param_config function.
```

**Public Members**

```c
int baud_rate
    UART baud rate
```

```c
uart_word_length_t data_bits
    UART byte size
```

```c
uart_parity_t parity
    UART parity mode
```

```c
uart_stop_bits_t stop_bits
    UART stop bits
```

```c
uart_hw_flowcontrol_t flow_ctrl
    UART HW flow control mode (cts/rts)
```

```c
uint8_t rx_flow_ctrl_thresh
    UART HW RTS threshold
```

```c
uart_sclk_t source_clk
    UART source clock selection
```

**Type Definitions**

```c
typedef int uart_port_t
    UART port number, can be UART_NUM_0 ~ (UART_NUM_MAX -1).
```
Enumerations

```c
enum uart_mode_t
    UART mode selection.

    Values:

    UART_MODE_UART = 0x00
    mode: regular UART mode

    UART_MODE_RS485_HALF_DUPLEX = 0x01
    mode: half duplex RS485 UART mode control by RTS pin

    UART_MODE_IRDA = 0x02
    mode: IRDA UART mode

    UART_MODE_RS485_COLLISION_DETECT = 0x03
    mode: RS485 collision detection UART mode (used for test purposes)

    UART_MODE_RS485_APP_CTRL = 0x04
    mode: application control RS485 UART mode (used for test purposes)

enum uart_word_length_t
    UART word length constants.

    Values:

    UART_DATA_5_BITS = 0x0
    word length: 5bits

    UART_DATA_6_BITS = 0x1
    word length: 6bits

    UART_DATA_7_BITS = 0x2
    word length: 7bits

    UART_DATA_8_BITS = 0x3
    word length: 8bits

    UART_DATA_BITS_MAX = 0x4

enum uart_stop_bits_t
    UART stop bits number.

    Values:

    UART_STOP_BITS_1 = 0x1
    stop bit: 1bit

    UART_STOP_BITS_1_5 = 0x2
    stop bit: 1.5bits

    UART_STOP_BITS_2 = 0x3
    stop bit: 2bits

    UART_STOP_BITS_MAX = 0x4

enum uart_parity_t
    UART parity constants.

    Values:

    UART_PARITY_DISABLE = 0x0
    Disable UART parity
```
UART_PARITY_EVEN = 0x2
Enable UART even parity

UART_PARITY_ODD = 0x3
Enable UART odd parity

enum uart_hw_flowcontrol_t
UART hardware flow control modes.

Values:

UART_HW_FLOWCTRL_DISABLE = 0x0
disable hardware flow control

UART_HW_FLOWCTRL_RTS = 0x1
enable RX hardware flow control (rts)

UART_HW_FLOWCTRL_CTS = 0x2
enable TX hardware flow control (cts)

UART_HW_FLOWCTRL_CTS_RTS = 0x3
enable hardware flow control

UART_HW_FLOWCTRL_MAX = 0x4

enum uart_signal_inv_t
UART signal bit map.

Values:

UART_SIGNAL_IRDA_TX_INV = (0x1 << 0)
inverse the UART irda_tx signal

UART_SIGNAL_IRDA_RX_INV = (0x1 << 1)
inverse the UART irda_rx signal

UART_SIGNAL_RXD_INV = (0x1 << 2)
inverse the UART rxd signal

UART_SIGNAL_CTS_INV = (0x1 << 3)
inverse the UART cts signal

UART_SIGNAL_DSR_INV = (0x1 << 4)
inverse the UART dsr signal

UART_SIGNAL_TXD_INV = (0x1 << 5)
inverse the UART txd signal

UART_SIGNAL_RTS_INV = (0x1 << 6)
inverse the UART rts signal

UART_SIGNAL_DTR_INV = (0x1 << 7)
inverse the UART dtr signal

enum uart_sclk_t
UART source clock.

Values:

UART_SCLK_APB = 0x0
UART source clock from APB

UART_SCLK_REF_TICK = 0x01
UART source clock from REF_TICK

2.3. Peripherals API
GPIO Lookup Macros

The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. `UART_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0)
3. `UART_CTS_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

**Header File**

- `soc/esp32/include/soc/uart_channel.h`

**Macros**

- `UART_GPIO1_DIRECT_CHANNEL`
- `UART_NUM_0_TXD_DIRECT_GPIO_NUM`
- `UART_GPIO3_DIRECT_CHANNEL`
- `UART_NUM_0_RXD_DIRECT_GPIO_NUM`
- `UART_GPIO19_DIRECT_CHANNEL`
- `UART_NUM_0_CTS_DIRECT_GPIO_NUM`
- `UART_GPIO22_DIRECT_CHANNEL`
- `UART_NUM_0_RTS_DIRECT_GPIO_NUM`
- `UART_TXD_GPIO1_DIRECT_CHANNEL`
- `UART_RXD_GPIO3 DIRECT_CHANNEL`
- `UART_CTS_GPIO19_DIRECT_CHANNEL`
- `UART_RTS_GPIO22_DIRECT_CHANNEL`
- `UART_GPIO10_DIRECT_CHANNEL`
- `UART_NUM_1_TXD_DIRECT_GPIO_NUM`
- `UART_GPIO9_DIRECT_CHANNEL`
- `UART_NUM_1_RXD_DIRECT_GPIO_NUM`
UART_GPIO6_DIRECT_CHANNEL
UART_NUM_1_CTS_DIRECT_GPIO_NUM
UART_GPIO1011_DIRECT_CHANNEL
UART_NUM_1_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO10_DIRECT_CHANNEL
UART_RXD_GPIO9_DIRECT_CHANNEL
UART_CTS_GPIO6_DIRECT_CHANNEL
UART_RTS_GPIO11_DIRECT_CHANNEL
UART_GPIO17_DIRECT_CHANNEL
UART_NUM_2_TXD_DIRECT_GPIO_NUM
UART_GPIO16 Direct_CHANNEL
UART_NUM_2_RXD_DIRECT_GPIO_NUM
UART_GPIO8_DIRECT_CHANNEL
UART_NUM_2_CTS_DIRECT_GPIO_NUM
UART_GPIO7_DIRECT_CHANNEL
UART_NUM_2_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO17_DIRECT_CHANNEL
UART_RXD_GPIO16_DIRECT_CHANNEL
UART_CTS_GPIO8_DIRECT_CHANNEL
UART_RTS_GPIO7_DIRECT_CHANNEL
Code examples for this API section are provided in the peripherals directory of ESP-IDF examples.

## 2.4 Application Protocols

[]

### 2.4.1 ASIO port

**Overview**

Asio is a cross-platform C++ library, see [https://think-async.com](https://think-async.com). It provides a consistent asynchronous model using a modern C++ approach.

**ASIO documentation**

Please refer to the original asio documentation at [https://think-async.com/Asio/Documentation](https://think-async.com/Asio/Documentation). Asio also comes with a number of examples which could be find under Documentation/Examples on that web site.
Supported features

ESP platform port currently supports only network asynchronous socket operations; does not support serial port and ssl. Internal asio settings for ESP include

- EXCEPTIONS are enabled in ASIO if enabled in menuconfig
- TYPEID is enabled in ASIO if enabled in menuconfig

Application Example

ESP examples are based on standard asio examples/protocols/asio:

- examples/protocols/asio/udp_echo_server
- examples/protocols/asio/tcp_echo_server
- examples/protocols/asio/chat_client
- examples/protocols/asio/chat_server

Please refer to the specific example README.md for details

2.4.2 ESP-MQTT

Overview

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

Features

- Supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

Application Example

- protocols/mqtt/tcp: MQTT over tcp, default port 1883
- protocols/mqtt/ssl: MQTT over tcp, default port 8883
- protocols/mqtt/ssl_psk: MQTT over tcp using pre-shared keys for authentication, default port 8883
- protocols/mqtt/ws: MQTT over Websocket, default port 80
- protocols/mqtt/wss: MQTT over Websocket Secure, default port 443
Configuration

URI

- Currently support mqtt, mqtts, ws, wss schemes
- MQTT over TCP samples:
  - mqtt://mqtt.eclipse.org: MQTT over TCP, default port 1883:
  - mqtt://mqtt.eclipse.org:1884 MQTT over TCP, port 1884:
  - mqtt://username:password@mqtt.eclipse.org:1884 MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - mqtts://mqtt.eclipse.org: MQTT over SSL, port 8883
  - mqtts://mqtt.eclipse.org:8884: MQTT over SSL, port 8884
- MQTT over Websocket samples:
  - ws://mqtt.eclipse.org:80/mqtt
- MQTT over Websocket Secure samples:
  - wss://mqtt.eclipse.org:443/mqtt
- Minimal configurations:

  ```
  const esp_mqtt_client_config_t mqtt_cfg = {
      .uri = "mqtt://mqtt.eclipse.org",
      // .user_context = (void *)your_context
  };
  esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
  esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler, client);
  esp_mqtt_client_start(client);
  ```

  • Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

SSL

- Get certificate from server, example: mqtt.eclipse.org openssl s_client -showcerts -connect mqtt.eclipse.org:8883 <dev/null 2>/dev/null | openssl x509 -outform PEM >mqtt_eclipse_org.pem
- Check the sample application: examples/mqtt_ssl
- Configuration:

  ```
  const esp_mqtt_client_config_t mqtt_cfg = {
      .uri = "mqtts://mqtt.eclipse.org:8883",
      .event_handle = mqtt_event_handler,
      .cert_pem = (const char *)mqtt_eclipse_org_pem_start,
  };
  ```

  If the certificate is not null-terminated then cert_len should also be set. Other SSL related configuration parameters are:

2.4. Application Protocols
• **use_global_ca_store**: use the global certificate store to verify server certificate, see esp-tls.h for more information

• **client_cert_pem**: pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.

• **client_cert_len**: length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem.

• **client_key_pem**: pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.

• **client_key_len**: length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem.

• **psk_hint_key**: pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

• **alpn_protos**: NULL-terminated list of protocols to be used for ALPN.

### Last Will and Testament

MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `esp_mqtt_client_config_t` struct.

- **lwt_topic**: pointer to the LWT message topic
- **lwt_msg**: pointer to the LWT message
- **lwt_msg_len**: length of the LWT message, required if lwt_msg is not null-terminated
- **lwt_qos**: quality of service for the LWT message
- **lwt_retain**: specifies the retain flag of the LWT message

### Other Configuration Parameters

- **disable_clean_session**: determines the clean session flag for the connect message, defaults to a clean session
- **keepalive**: determines how many seconds the client will wait for a ping response before disconnecting, default is 120 seconds.
- **disable_auto_reconnect**: enable to stop the client from reconnecting to server after errors or disconnects
- **user_context**: custom context that will be passed to the event handler
- **task_prio**: MQTT task priority, defaults to 5
- **task_stack**: MQTT task stack size, defaults to 6144 bytes, setting this will override setting from menuconfig
- **buffer_size**: size of MQTT send/receive buffer, default is 1024 bytes
- **username**: pointer to the username used for connecting to the broker
- **password**: pointer to the password used for connecting to the broker
- **client_id**: pointer to the client id, defaults to ESP32_%CHIPID% where %CHIPID% are the last 3 bytes of MAC address in hex format
- **host**: MQTT broker domain (ipv4 as string), setting the uri will override this
- **port**: MQTT broker port, specifying the port in the uri will override this
• transport: sets the transport protocol, setting the uri will override this
• refresh_connection_after_ms: refresh connection after this value (in milliseconds)
• event_handle: handle for MQTT events as a callback in legacy mode
• event_loop_handle: handle for MQTT event loop library

For more options on esp_mqtt_client_config_t, please refer to API reference below

Change settings in Project Configuration Menu

The settings for MQTT can be found using idf.py menuconfig, under Component config -> ESP-MQTT Configuration

The following settings are available:

- CONFIG_MQTT_PROTOCOL_311: Enables 3.1.1 version of MQTT protocol
- CONFIG_MQTT_TRANSPORT_SSL, CONFIG_MQTT_TRANSPORT_WEBSOCKET: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
- CONFIG_MQTT_CUSTOM_OUTBOX: Disables default implementation of mqtt_outbox, so a specific implementation can be supplied

Events

The following events may be posted by the MQTT client:

- MQTT_EVENT_BEFORE_CONNECT: The client is initialized and about to start connecting to the broker.
- MQTT_EVENT_CONNECTED: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- MQTT_EVENT_DISCONNECTED: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- MQTT_EVENT_SUBSCRIBED: The broker has acknowledged the client’s subscribe request. The event data will contain the message ID of the subscribe message.
- MQTT_EVENT_UNSUBSCRIBED: The broker has acknowledged the client’s unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- MQTT_EVENT_PUBLISHED: The broker has acknowledged the client’s publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- MQTT_EVENT_DATA: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple MQTT_EVENT_DATA will be posted and current_data_offset and total_data_len from event data updated to keep track of the fragmented message.
- MQTT_EVENT_ERROR: The client has encountered an error. esp_mqtt_error_type_t from error_handle in the event data can be used to further determine the type of the error. The type of error will determine which parts of the error_handle struct is filled.
API Reference

Header File

- mqtt.esp-mqtt/include/mqtt_client.h

Functions

```c
esp_mqtt_client_handle_t esp_mqtt_client_init(const esp_mqtt_client_config_t *config)
```

Creates mqtt client handle based on the configuration.

**Return** mqtt_client_handle if successfully created, NULL on error

**Parameters**

- `config`: mqtt configuration structure

```c
esp_err_t esp_mqtt_client_set_uri(esp_mqtt_client_handle_t client, const char *uri)
```

Sets mqtt connection URI. This API is usually used to overrides the URI configured in esp_mqtt_client_init.

**Return** ESP_FAIL if URI parse error, ESP_OK on success

**Parameters**

- `client`: mqtt client handle
- `uri`: 

```c
esp_err_t esp_mqtt_client_start(esp_mqtt_client_handle_t client)
```

Starts mqtt client with already created client handle.

**Return** ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

**Parameters**

- `client`: mqtt client handle

```c
esp_err_t esp_mqtt_client_reconnect(esp_mqtt_client_handle_t client)
```

This api is typically used to force reconnection upon a specific event.

**Return** ESP_OK on success ESP_FAIL if client is in invalid state

**Parameters**

- `client`: mqtt client handle

```c
esp_err_t esp_mqtt_client_disconnect(esp_mqtt_client_handle_t client)
```

This api is typically used to force disconnection from the broker.

**Return** ESP_OK on success

**Parameters**

- `client`: mqtt client handle

```c
esp_err_t esp_mqtt_client_stop(esp_mqtt_client_handle_t client)
```

Stops mqtt client tasks.
**Return**  ESP_OK on success ESP_FAIL if client is in invalid state

**Parameters**

- `client`: mqtt client handle

`int esp_mqtt_clientSubscribe(esp_mqtt_client_handle_t client, const char *topic, int qos)`

Subscribe the client to defined topic with defined qos.

**Notes:**

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

**Return**  message_id of the subscribe message on success -1 on failure

**Parameters**

- `client`: mqtt client handle
  - `topic`:
  - `qos`:

`int esp_mqtt_clientUnsubscribe(esp_mqtt_client_handle_t client, const char *topic)`

Unsubscribe the client from defined topic.

**Notes:**

- Client must be connected to send unsubscribe message
- It is thread safe, please refer to esp_mqtt_clientSubscribe for details

**Return**  message_id of the subscribe message on success -1 on failure

**Parameters**

- `client`: mqtt client handle
  - `topic`:

`int esp_mqtt_clientPublish(esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)`

Client to send a publish message to the broker.

**Notes:**

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn’t have to be connected to send publish message (although it would drop all qos=0 messages, qos>1 messages would be enqueued)
- It is thread safe, please refer to esp_mqtt_clientSubscribe for details

**Return**  message_id of the publish message (for QoS 0 message_id will always be zero) on success. -1 on failure.

**Parameters**

- `client`: mqtt client handle
  - `topic`: topic string
• data: payload string (set to NULL, sending empty payload message)
• len: data length, if set to 0, length is calculated from payload string
• qos: qos of publish message
• retain: retain flag

 esp_err_t esp_mqtt_client_destroy (esp_mqtt_client_handle_t client)
Destroys the client handle.

Return ESP_OK
Parameters
• client: mqtt client handle

 esp_err_t esp_mqtt_set_config (esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)
Set configuration structure, typically used when updating the config (i.e. on “before_connect” event.

Return ESP_ERR_NO_MEM if failed to allocate ESP_OK on success
Parameters
• client: mqtt client handle
• config: mqtt configuration structure

 esp_err_t esp_mqtt_client_register_event (esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)
Registers mqtt event.

Return ESP_ERR_NO_MEM if failed to allocate ESP_OK on success
Parameters
• client: mqtt client handle
• event: event type
• event_handler: handler callback
• event_handler_arg: handlers context

Structures

struct esp_mqtt_error_codes
MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

<table>
<thead>
<tr>
<th>error_type</th>
<th>related member variables</th>
<th>note</th>
<th>Mqtt_ERROR_TYPE_ESP_TLS</th>
<th>esp_tls_last.esp.err, esp_tls_stack.err, esp_tls_cert_verify_flags</th>
<th>Error reported from esp-tls</th>
</tr>
</thead>
</table>
MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from MQTT broker on connection |

**Public Members**

```c
esp_err_t esp_tls_last_esp_err
last esp_err code reported from esp-tls component
```

```c
int esp_tls_stack_err
tls specific error code reported from underlying tls stack
```

```c
int esp_tls_cert_verify_flags
tls flags reported from underlying tls stack during certificate verification
```

```c
esp_mqtt_error_type_t error_type
error type referring to the source of the error
```

```c
esp_mqtt_connect_return_code_t connect_return_code
connection refused error code reported from MQTT broker on connection
```

```c
struct esp_mqtt_event_t
MQTT event configuration structure
```

**Public Members**

```c
esp_mqtt_event_id_t event_id
MQTT event type
```

```c
esp_mqtt_client_handle_t client
MQTT client handle for this event
```

```c
void *user_context
User context passed from MQTT client config
```

```c
char *data
Data associated with this event
```

```c
int data_len
Length of the data for this event
```

```c
int total_data_len
Total length of the data (longer data are supplied with multiple events)
```

```c
int current_data_offset
Actual offset for the data associated with this event
```

```c
char *topic
Topic associated with this event
```

```c
int topic_len
Length of the topic for this event associated with this event
```

```c
int msg_id
MQTT messaged id of message
```

```c
int session_present
MQTT session_present flag for connection event
```

```c
esp_mqtt_error_codes_t *error_handle
esp-mqtt error handle including esp-tls errors as well as internal mqtt errors
```
struct esp_mqtt_client_config_t
MQTT client configuration structure

Public Members

mqtt_event_callback_t event_handle
handle for MQTT events as a callback in legacy mode

esp_event_loop_handle_t event_loop_handle
handle for MQTT event loop library

const char *host
MQTT server domain (ipv4 as string)

const char *uri
Complete MQTT broker URI

uint32_t port
MQTT server port

const char *client_id
default client id is ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

const char *username
MQTT username

const char *password
MQTT password

const char *lwt_topic
LWT (Last Will and Testament) message topic (NULL by default)

const char *lwt_msg
LWT message (NULL by default)

int lwt_qos
LWT message qos

int lwt_retain
LWT retained message flag

int lwt_msg_len
LWT message length

int disable_clean_session
mqtt clean session, default clean_session is true

int keepalive
mqtt keepalive, default is 120 seconds

bool disable_auto_reconnect
this mqtt client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable

void *user_context
pass user context to this option, then can receive that context in event->user_context

int task_prio
MQTT task priority, default is 5, can be changed in make menuconfig

int task_stack
MQTT task stack size, default is 6144 bytes, can be changed in make menuconfig
int **buffer_size**
size of MQTT send/receive buffer, default is 1024 (only receive buffer size if out_buffer_size defined)

**const char *cert_pem**
Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert_len.

size_t **cert_len**
Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

**const char **client_cert_pem**
Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_key_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_cert_len.

size_t **client_cert_len**
Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

**const char **client_key_pem**
Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_cert_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_key_len

size_t **client_key_len**
Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

**esp_mqtt_transport_t transport**
overrides URI transport

int **refresh_connection_after_ms**
Refresh connection after this value (in milliseconds)

**const struct psk_key_hint **psk_hint_key**
Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

bool **use_global_ca_store**
Use a global ca_store for all the connections in which this bool is set.

int **reconnect_timeout_ms**
Reconnect to the broker after this value in miliseconds if auto reconnect is not disabled

**const char **alpn_protos**
NULL-terminated list of supported application protocols to be used for ALPN

**const char **clientkey_password**
Client key decryption password string

int **clientkey_password_len**
String length of the password pointed to by clientkey_password

**esp_mqtt_protocol_ver_t protocol_ver**
MQTT protocol version used for connection, defaults to value from menuconfig

int **out_buffer_size**
size of MQTT output buffer. If not defined, both output and input buffers have the same size defined as buffer_size

2.4. Application Protocols
Type Definitions

typedef struct esp_mqtt_client *esp_mqtt_client_handle_t

typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
    MQTT error code structure to be passed as a contextual information into ERROR event.

    Important: This structure extends esp_tls_last_error error structure and is backward compatible with it
    (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applica-
    tions if used this way previously)

    Use this structure directly checking error_type first and then appropriate error code depending on the source of
    the error:

        | error_type | related member variables | note | | MQTT_ERROR_TYPE_ESP_TLS | esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags | Error reported from esp-tls |
        | MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from
        MQTT broker on connection |

typedef esp_mqtt_event_t *esp_mqtt_event_handle_t

typedef esp_err_t (*mqtt_event_callback_t)(esp_mqtt_event_handle_t event)

Enumerations

enum esp_mqtt_event_id_t
    MQTT event types.

    User event handler receives context data in esp_mqtt_event_t structure with

        • user_context - user data from esp_mqtt_client_config_t
        • client - mqtt client handle
        • various other data depending on event type

    Values:

MQTT_EVENT_ANY = -1

MQTT_EVENT_ERROR = 0
    on error event, additional context: connection return code, error handle from esp_tls (if supported)

MQTT_EVENT_CONNECTED
    connected event, additional context: session_present flag

MQTT_EVENT_DISCONNECTED
    disconnected event

MQTT_EVENT_SUBSCRIBED
    subscribed event, additional context: msg_id

MQTT_EVENT_UNSUBSCRIBED
    unsubscribed event

MQTT_EVENT_PUBLISHED
    published event, additional context: msg_id

MQTT_EVENT_DATA
    data event, additional context:
        • msg_id message id
• topic pointer to the received topic
• topic_len length of the topic
• data pointer to the received data
• data_len length of the data for this event
• current_data_offset offset of the current data for this event
• total_data_len total length of the data received Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

MQTT_EVENT_BEFORE_CONNECT
The event occurs before connecting

enum esp_mqtt_connect_return_code_t
MQTT connection error codes propagated via ERROR event

Values:

MQTT_CONNECTION_ACCEPTED = 0
  Connection accepted

MQTT_CONNECTION_REFUSE_PROTOCOL
  MQTT connection refused reason: Wrong protocol

MQTT_CONNECTION_REFUSE_ID_REJECTED
  MQTT connection refused reason: ID rejected

MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE
  MQTT connection refused reason: Server unavailable

MQTT_CONNECTION_REFUSE_BAD_USERNAME
  MQTT connection refused reason: Wrong user

MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED
  MQTT connection refused reason: Wrong username or password

enum esp_mqtt_error_type_t
MQTT connection error codes propagated via ERROR event

Values:

MQTT_ERROR_TYPE_NONE = 0

MQTT_ERROR_TYPE_ESP_TLS

MQTT_ERROR_TYPE_CONNECTION_REFUSED

enum esp_mqtt_transport_t
Values:

MQTT_TRANSPORT_UNKNOWN = 0x0

MQTT_TRANSPORT_OVER_TCP
  MQTT over TCP, using scheme: mqtt

MQTT_TRANSPORT_OVER_SSL
  MQTT over SSL, using scheme: mqtts

MQTT_TRANSPORT_OVER_WS
  MQTT over Websocket, using scheme:: ws
MQTT_TRANSPORT_OVER_WSS
MQTT over Websocket Secure, using scheme: wss

enum esp_mqtt_protocol_ver_t
MQTT protocol version used for connection

Values:
MQTT_PROTOCOL_UNDEFINED = 0
MQTT_PROTOCOL_V_3_1
MQTT_PROTOCOL_V_3_1_1

2.4.3 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the esp_tls_cfg_t data structure. Once done, TLS communication can be conducted using the following APIs:

• esp_tls_conn_new(): for opening a new TLS connection.
• esp_tls_conn_read(): for reading from the connection.
• esp_tls_conn_write(): for writing into the connection.
• esp_tls_conn_delete(): for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: protocols/https_request.

Tree structure for ESP-TLS component

```
```

The ESP-TLS component has a file esp-tls.esp_tls.h which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between mbedtls and wolfssl for its operation. API specific to mbedtls are present in esp-tls/private_include/esp_tls_mbedtls.h and API specific to wolfssl are present in esp-tls/private_include/esp_tls_wolfssl.h.

Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at https://github.com/espressif/
esp-wolfssl. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

Note: As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.

### How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project:

1) Directly add wolfssl as a component in your project with following three commands:

```bash
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

2) Add wolfssl as an extra component in your project.

   - Download wolfssl with:

     ```bash
git clone https://github.com/espressif/esp-wolfssl.git
```

   - Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt/Makefile of your project as done in wolfssl/examples. For reference see Optional Project variables in build-system.

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py/make menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

### Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when protocols/https_request example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

<table>
<thead>
<tr>
<th>Property</th>
<th>Wolfssl</th>
<th>Mbedtls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Heap Consumed</td>
<td>~19 Kb</td>
<td>~37 Kb</td>
</tr>
<tr>
<td>Task Stack Used</td>
<td>~2.2 Kb</td>
<td>~3.6 Kb</td>
</tr>
<tr>
<td>Bin size</td>
<td>~858 Kb</td>
<td>~736 Kb</td>
</tr>
</tbody>
</table>

Note: These values are subject to change with change in configuration options and version of respective libraries.

### API Reference

2.4. Application Protocols
Header File

• esp-tls/esp_tls.h

Functions

unsigned esp_tls_t *esp_tls_init (void)
Create TLS connection.

This function allocates and initializes esp-tls structure handle.

Return tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

unsigned esp_tls_t *esp_tls_conn_new (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg)
Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is esp_tls_conn_new_sync (and its asynchronous version esp_tls_conn_new_async)

Return pointer to esp_tls_t, or NULL if connection couldn’t be opened.

Parameters

• hostname: Hostname of the host.
• hostlen: Length of hostname.
• port: Port number of the host.
• cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.

int esp_tls_conn_new_sync (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

Return

• -1 If connection establishment fails.
• 1 If connection establishment is successful.
• 0 If connection state is in progress.

Parameters

• hostname: Hostname of the host.
• hostlen: Length of hostname.
• port: Port number of the host.
• cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
• tls: Pointer to esp-tls as esp-tls handle.
esp_tls_t *esp_tls_conn_http_new(const char *url, const esp_tls_cfg_t *cfg)

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

Return  pointer to esp_tls_t, or NULL if connection couldn’t be opened.

Parameters
  • url: url of host.
  • cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL.
    For TLS connection, a pass pointer to ‘esp_tls_cfg_t’. At a minimum, this structure should be zero-initializ...
static ssize_t esp_tls_conn_write(esp_tls_t *tls, const void *data, size_t datalen)
Write from buffer ‘data’ into specified tls connection.

Return
• >0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
• 0 if write operation was not successful. The underlying connection was closed.
• <0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.

Parameters
• tls: pointer to esp-tls as esp-tls handle.
• data: Buffer from which data will be written.
• datalen: Length of data buffer.

static ssize_t esp_tls_conn_read(esp_tls_t *tls, void *data, size_t datalen)
Read from specified tls connection into the buffer ‘data’.

Return
• >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
• 0 if read operation was not successful. The underlying connection was closed.
• <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

Parameters
• tls: pointer to esp-tls as esp-tls handle.
• data: Buffer to hold read data.
• datalen: Length of data buffer.

void esp_tls_conn_delete(esp_tls_t *tls)
Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with esp_tls_conn_new() or esp_tls_conn_http_new() APIs.

Parameters
• tls: pointer to esp-tls as esp-tls handle.

ssize_t esp_tls_get_bytes_avail(esp_tls_t *tls)
Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls's mbedtls_ssl_get_bytes_avail() API.

Return
• -1 in case of invalid arg
• bytes available in the application data record read buffer

Parameters
• **tls**: pointer to esp-tls as esp-tls handle.

```c
esp_err_t esp_tls_init_global_ca_store(void)
```

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().

**Return**

- ESP_OK if creating global CA store was successful.
- ESP_ERR_NO_MEM if an error occurred when allocating the mbedTLS resources.

```c
esp_err_t esp_tls_set_global_ca_store(const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)
```

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before calling esp_tls_conn_new().

**Return**

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

**Parameters**

- **cacert_pem_buf**: Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- **cacert_pem_bytes**: Length of the buffer.

```c
void esp_tls_free_global_ca_store(void)
```

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

```c
esp_err_t esp_tls_get_and_clear_last_error(esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)
```

Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

**Return**

- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK (0) if no error occurred
- specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

**Parameters**

- **h**: esp-tls error handle.
- **esp_tls_code**: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

### 2.4. Application Protocols
• **esp_tls_flags**: last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

**Structures**

**struct esp_tls_last_error**
Error structure containing relevant errors in case tls error occurred.

**Public Members**

* esp_err_t **last_error**
  error code (based on ESP_ERR_ESP_TLS_BASE) of the last occurred error

* int **esp_tls_error_code**
  esp_tls error code from last esp_tls failed api

* int **esp_tls_flags**
  last certification verification flags

**struct psk_key_hint**
ESP-TLS preshared key and hint structure.

**Public Members**

* const uint8_t **key**
  key in PSK authentication mode in binary format

* const size_t **key_size**
  length of the key

* const char **hint**
  hint in PSK authentication mode in string format

**struct esp_tls_cfg**
ESP-TLS configuration parameters.

**Note**  Note about format of certificates:

* This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).

* Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format

* Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

**Public Members**

* const char **alpn_protos**
  Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = { "h2", NULL };
• where ‘h2’ is the protocol name

```c
const unsigned char *cacert_buf
    Certificate Authority’s certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support
    This buffer should be NULL terminated in case of PEM

cacert_pem_buf
    CA certificate buffer legacy name

unsigned int cacert_bytes
    Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

cacert_pem_bytes
    Size of Certificate Authority certificate legacy name

const unsigned char *clientcert_buf
    Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

cclientcert_pem_buf
    Client certificate legacy name

unsigned int clientcert_bytes
    Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

clientcert_pem_bytes
    Size of client certificate legacy name

const unsigned char *clientkey_buf
    Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

clientkey_pem_buf
    Client key legacy name

unsigned int clientkey_bytes
    Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

clientkey_pem_bytes
    Size of client key legacy name

const unsigned char *clientkey_password
    Client key decryption password string

unsigned int clientkey_password_len
    String length of the password pointed to by clientkey_password

bool non_block
    Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

int timeout_ms
    Network timeout in milliseconds

bool use_global_ca_store
    Use a global ca_store for all the connections in which this bool is set.

const char *common_name
    If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.
```

```c
bool skip_common_name
    Skip any validation of server certificate CN field

const psk_hint_key_t *psk_hint_key
    Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

struct esp_tls
    ESP-TLS Connection Handle.
```

**Public Members**

```c
int sockfd
    Underlying socket file descriptor.

ssize_t (*read)(struct esp_tls *tls, char *data, size_t datalen)
    Callback function for reading data from TLS/SSL connection.

ssize_t (*write)(struct esp_tls *tls, const char *data, size_t datalen)
    Callback function for writing data to TLS/SSL connection.

esp_tls_conn_state_t conn_state
    ESP-TLS Connection state

fd_set rset
    read file descriptors

fd_set wset
    write file descriptors

bool is_tls
    indicates connection type (TLS or NON-TLS)

esp_tls_role_t role
    esp-tls role
    • ESP_TLS_CLIENT
    • ESP_TLS_SERVER

esp_tls_error_handle_t error_handle
    handle to error descriptor
```

**Macros**

```c
ESP_ERR_ESP_TLS_BASE
    Starting number of ESP-TLS error codes

ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME
    Error if hostname couldn’t be resolved upon tls connection

ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET
    Failed to create socket

ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY
    Unsupported protocol family

ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST
    Failed to connect to host
```
ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED
failed to set socket option
ESP_ERR_MBEDTLS_CERT_PARTLY_OK
mbedtls parse certificates was partly successful
ESP_ERR_MBEDTLS_CTR_DRBG_SEED_FAILED
mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_SET_HOSTNAME_FAILED
mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_CONFIG_DEFAULTS_FAILED
mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_CONF_ALPN_PROTOCOLS_FAILED
mbedtls api returned error
ESP_ERR_MBEDTLS_X509_CRT_PARSE_FAILED
mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_CONF_own_cert_FAILED
mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_SETUP_FAILED
mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_WRITE_FAILED
mbedtls api returned error
ESP_ERR_MBEDTLS_PK_PARSE_KEY_FAILED
mbedtls api returned failed
ESP_ERR_MBEDTLS_SSL_HANDSHAKE_FAILED
mbedtls api returned failed
ESP_ERR_MBEDTLS_SSL_CONF_PSK_FAILED
mbedtls api returned failed
ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT
new connection in esp_tls_low_level_conn connection timeouted

Type Definitions

typedef struct esp_tls_last_error *esp_tls_error_handle_t

typedef struct esp_tls_last_error esp_tls_last_error_t
Error structure containing relevant errors in case tls error occurred.

typedef enum esp_tls_conn_state esp_tls_conn_state_t
ESP-TLS Connection State.

typedef enum esp_tls_role esp_tls_role_t

typedef struct psk_key_hint psk_hint_key_t
ESP-TLS preshared key and hint structure.

typedef struct esp_tls_cfg esp_tls_cfg_t
ESP-TLS configuration parameters.

Note Note about format of certificates:
• This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).

• Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format

• Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

typedef struct esp_tls esp_tls_t
ESP-TLS Connection Handle.

Enumerations

definition of esp_tls_conn_state
ESP-TLS Connection State.

Values:
ESP_TLS_INIT = 0
ESP_TLS_CONNECTING
ESP_TLS_HANDSHAKE
ESP_TLS_FAIL
ESP_TLS_DONE

definition of esp_tls_role
Values:
ESP_TLS_CLIENT = 0
ESP_TLS_SERVER

2.4.4 ESP HTTP Client

Overview

est_http_client provides an API for making HTTP/S requests from ESP-IDF programs. The steps to use this API for an HTTP request are:

• esp_http_client_init(): To use the HTTP client, the first thing we must do is create an esp_http_client by pass into this function with the esp_http_client_config_t configurations. Which configuration values we do not define, the library will use default.

• esp_http_client_perform(): The esp_http_client argument created from the init function is needed. This function performs all operations of the esp_http_client, from opening the connection, sending data, downloading data and closing the connection if necessary. All related events will be invoked in the event_handle (defined by esp_http_client_config_t). This function performs its job and blocks the current task until it’s done

• esp_http_client_cleanup(): After completing our esp_http_client’s task, this is the last function to be called. It will close the connection (if any) and free up all the memory allocated to the HTTP client
Application Example

esp_err_t _http_event_handle(esp_http_client_event_t *evt)
{
    switch(evt->event_id) {
    case HTTP_EVENT_ERROR:
        ESP_LOGI(TAG, "HTTP_EVENT_ERROR");
        break;
    case HTTP_EVENT_ON_CONNECTED:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_CONNECTED");
        break;
    case HTTP_EVENT_HEADER_SENT:
        ESP_LOGI(TAG, "HTTP_EVENT_HEADER_SENT");
        break;
    case HTTP_EVENT_ON_HEADER:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_HEADER");
        printf("%.s", evt->data_len, (char*)evt->data);
        break;
    case HTTP_EVENT_ON_DATA:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_DATA, len=%d", evt->data_len);
        if (!esp_http_client_is_chunked_response(evt->client)) {
            printf("%.s", evt->data_len, (char*)evt->data);
        }
        break;
    case HTTP_EVENT_ON_FINISH:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_FINISH");
        break;
    case HTTP_EVENT_DISCONNECTED:
        ESP_LOGI(TAG, "HTTP_EVENT_DISCONNECTED");
        break;
    }
    return ESP_OK;
}

esp_http_client_config_t config = {
    .url = "http://httpbin.org/redirect/2",
    .event_handler = _http_event_handle,
};
esp_http_client_handle_t client = esp_http_client_init(&config);
esp_err_t err = esp_http_client_perform(client);

if (err == ESP_OK) {
    ESP_LOGI(TAG, "Status = %d, content_length = %d",
        esp_http_client_get_status_code(client),
        esp_http_client_get_content_length(client));
}
esp_http_client_cleanup(client);

Persistent Connections

Persistent connections means that the HTTP client can re-use the same connection for several transfers. If the server does not request to close the connection with the Connection: close header, the new transfer with sample ip address, port, and protocol.

To allow the HTTP client to take full advantage of persistent connections, you should do as many of your file transfers as possible using the same handle.
Persistent Connections example

```c
esp_err_t err;
esp_http_client_config_t config = {
    .url = "http://httpbin.org/get",
};
esp_http_client_handle_t client = esp_http_client_init(&config);
// first request
err = esp_http_client_perform(client);

// second request
esp_http_client_set_url(client, "http://httpbin.org/anything")
esp_http_client_set_method(client, HTTP_METHOD_DELETE);
esp_http_client_set_header(client, "HeaderKey", "HeaderValue");
err = esp_http_client_perform(client);

esp_http_client_cleanup(client);
```

HTTPS

The HTTP client supports SSL connections using `mbedtls`, with the `url` configuration starting with `https` scheme (or `transport_type = HTTP_TRANSPORT_OVER_SSL`). HTTPS support can be configured via :ref:`CONFIG_ENABLE_HTTPS` (enabled by default).

**Note:** By providing information using HTTPS, the library will use the SSL transport type to connect to the server. If you want to verify server, then need to provide additional certificate in PEM format, and provide to `cert_pem` in `esp_http_client_config_t`.

HTTPS example

```c
static void https()
{
    esp_http_client_config_t config = {
        .url = "https://www.howsmyssl.com",
        .cert_pem = howsmyssl_com_root_cert_pem_start,
    };
    esp_http_client_handle_t client = esp_http_client_init(&config);
    esp_err_t err = esp_http_client_perform(client);

    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Status = %d, content_length = %d",
                esp_http_client_get_status_code(client),
                esp_http_client_get_content_length(client));
    }
    esp_http_client_cleanup(client);
}
```

HTTP Stream

Some applications need to open the connection and control the reading of the data in an active manner. The HTTP client supports some functions to make this easier, of course, once you use these functions you should not use the
**esp_http_client_perform()** function with that handle, and **esp_http_client_init()** always to called first to get the handle. Perform that functions in the order below:

- **esp_http_client_init()**: to create and handle
- **esp_http_client_set_*** or **esp_http_client_delete_***: to modify the http connection information (optional)
- **esp_http_client_open()**: Open the http connection with write_len parameter, write_len=0 if we only need read
- **esp_http_client_write()**: Upload data, max length equal to write_len of **esp_http_client_open()** function. We may not need to call it if write_len=0
- **esp_http_client_fetch_headers()**: After sending the headers and write data (if any) to the server, this function will read the HTTP Server response headers. Calling this function will return the content-length from the Server, and we can call **esp_http_client_get_status_code()** for the HTTP status of the connection.
- **esp_http_client_read()**: Now, we can read the HTTP stream by this function.
- **esp_http_client_close()**: We should the connection after finish
- **esp_http_client_cleanup()**: And release the resources

Perform HTTP request as Stream reader

Check the example function **http_perform_as_stream_reader** at protocols/esp_http_client.

**HTTP Authentication**

The HTTP client supports both **Basic** and **Digest** Authentication. By providing usernames and passwords in url or in the username, password of config entry. And with auth_type = HTTP_AUTH_TYPE_BASIC, the HTTP client takes only 1 perform to pass the authentication process. If auth_type = HTTP_AUTH_TYPE_NONE, but there are username and password in the configuration, the HTTP client takes 2 performs. The first time it connects to the server and receives the UNAUTHORIZED header. Based on this information, it will know which authentication method to choose, and perform it on the second.

**Config authentication example with URI**

```c
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

**Config authentication example with username, password entry**

```c
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```
HTTP Client example: `protocols/esp_http_client`.

**API Reference**

**Header File**

- `esp_http_client/include/esp_http_client.h`

**Functions**

`esp_http_client_handle_t esp_http_client_init(const esp_http_client_config_t *config)`

Start a HTTP session. This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

**Return**

- `esp_http_client_handle_t`
- NULL if any errors

**Parameters**

- `config`: The configurations, see `http_client_config_t`

`esp_err_t esp_http_client_perform(esp_http_client_handle_t client)`

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intensive and using less network resources. Just note that you will have to use `esp_http_client_set_**` between the invokes to set options for the following `esp_http_client_perform`.

**Note** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.

**Return**

- ESP_OK on successful
- ESP_FAIL on error

**Parameters**

- `client`: The `esp_http_client_handle`
esp_err_t esp_http_client_set_url (esp_http_client_handle_t client, const char *url)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

Return

• ESP_OK
• ESP_FAIL

Parameters

• client: The esp_http_client handle
• url: The url

esp_err_t esp_http_client_set_post_field (esp_http_client_handle_t client, const char *data, int len)

Set post data, this function must be called before esp_http_client_perform. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

Return

• ESP_OK
• ESP_FAIL

Parameters

• client: The esp_http_client handle
• data: post data pointer
• len: post length

int esp_http_client_get_post_field (esp_http_client_handle_t client, char **data)

Get current post field information.

Return  Size of post data

Parameters

• client: The client
• data: Point to post data pointer

esp_err_t esp_http_client_set_header (esp_http_client_handle_t client, const char *key, const char *value)

Set http request header, this function must be called after esp_http_client_init and before any perform function.

Return

• ESP_OK
• ESP_FAIL

Parameters

• client: The esp_http_client handle
• key: The header key
• value: The header value

2.4. Application Protocols 971
`esp_err_t esp_http_client_get_header(esp_http_client_handle_t client, const char *key, char **value)`

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

Return

- ESP_OK
- ESP_FAIL

Parameters

- `client`: The esp_http_client handle
- `key`: The header key
- `value`: The header value

`esp_err_t esp_http_client_get_username(esp_http_client_handle_t client, char **value)`

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

Return

- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters

- `client`: The esp_http_client handle
- `value`: The username value

`esp_err_t esp_http_client_set_username(esp_http_client_handle_t client, const char *username)`

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

Return

- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters

- `client`: The esp_http_client handle
- `username`: The username value

`esp_err_t esp_http_client_get_password(esp_http_client_handle_t client, char **value)`

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

Return

- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters
• client: The esp_http_client handle
• value: The password value

`esp_err_t esp_http_client_set_password(esp_http_client_handle_t client, char *password)`

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Return**

• ESP_OK
• ESP_ERR_INVALID_ARG

**Parameters**

• client: The esp_http_client handle
• password: The password value

`esp_err_t esp_http_client_set_auth_type(esp_http_client_handle_t client, esp_http_client_auth_type_t auth_type)`

Set http request auth_type.

**Return**

• ESP_OK
• ESP_ERR_INVALID_ARG

**Parameters**

• client: The esp_http_client handle
• auth_type: The esp_http_client auth type

`esp_err_t esp_http_client_set_method(esp_http_client_handle_t client, esp_http_client_method_t method)`

Set http request method.

**Return**

• ESP_OK
• ESP_ERR_INVALID_ARG

**Parameters**

• client: The esp_http_client handle
• method: The method

`esp_err_t esp_http_client_delete_header(esp_http_client_handle_t client, const char *key)`

Delete http request header.

**Return**

• ESP_OK
• ESP_FAIL

**Parameters**

• client: The esp_http_client handle
**esp_err_t esp_http_client_open**(esp_http_client_handle_t client, int write_len)

This function will open the connection, write all header strings and return.

**Return**

- ESP_OK
- ESP_FAIL

**Parameters**

- client: The esp_http_client handle
- write_len: HTTP Content length need to write to the server

**int esp_http_client_write**(esp_http_client_handle_t client, const char *buffer, int len)

This function will write data to the HTTP connection previously opened by esp_http_client_open()

**Return**

- (-1) if any errors
- Length of data written

**Parameters**

- client: The esp_http_client handle
- buffer: The buffer
- len: This value must not be larger than the write_len parameter provided to esp_http_client_open()

**int esp_http_client_fetch_headers**(esp_http_client_handle_t client)

This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.

**Return**

- (0) if stream doesn’t contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked_response)
- (-1: ESP_FAIL) if any errors
- Download data length defined by content-length header

**Parameters**

- client: The esp_http_client handle

**bool esp_http_client_is_chunked_response**(esp_http_client_handle_t client)

Check response data is chunked.

**Return** true or false

**Parameters**

- client: The esp_http_client handle

**int esp_http_client_read**(esp_http_client_handle_t client, char *buffer, int len)

Read data from http stream.

**Return**
• (-1) if any errors
• Length of data was read

**Parameters**

- `client`: The esp_http_client handle
- `buffer`: The buffer
- `len`: The length

```c
int esp_http_client_get_status_code(esp_http_client_handle_t client)
```

Get http response status code, the valid value if this function invoke after `esp_http_client_perform`.

**Return**

Status code

**Parameters**

- `client`: The esp_http_client handle

```c
int esp_http_client_get_content_length(esp_http_client_handle_t client)
```

Get http response content length (from header Content-Length) the valid value if this function invoke after `esp_http_client_perform`.

**Return**

• (-1) Chunked transfer
• Content-Length value as bytes

**Parameters**

- `client`: The esp_http_client handle

```c
esp_err_t esp_http_client_close(esp_http_client_handle_t client)
```

Close http connection, still kept all http request resources.

**Return**

• ESP_OK
• ESP_FAIL

**Parameters**

- `client`: The esp_http_client handle

```c
esp_err_t esp_http_clientCleanup(esp_http_client_handle_t client)
```

This function must be the last function to call for an session. It is the opposite of the `esp_http_client_init` function and must be called with the same handle as input that a `esp_http_client_init` call returned. This might close all connections this handle has used and possibly has kept open until now. Don’t call this function if you intend to transfer more files, re-using handles is a key to good performance with `esp_http_client`.

**Return**

• ESP_OK
• ESP_FAIL

**Parameters**

- `client`: The esp_http_client handle
**esp_http_client_transport_t**

`esp_http_client_get_transport_type(esp_http_client_handle_t client)`

Get transport type.

**Return**

- HTTP_TRANSPORT_UNKNOWN
- HTTP_TRANSPORT_OVER_TCP
- HTTP_TRANSPORT_OVER_SSL

**Parameters**

- `client`: The esp_http_client handle

**esp_err_t**

`esp_http_client_set_redirection(esp_http_client_handle_t client)`

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

**Return**

- ESP_OK
- ESP_FAIL

**Parameters**

- `client`: The esp_http_client handle

**void**

`esp_http_client_add_auth(esp_http_client_handle_t client)`

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

**Note** There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

**Parameters**

- `client`: The esp_http_client handle

**bool**

`esp_http_client_is_complete_data_received(esp_http_client_handle_t client)`

Checks if entire data in the response has been read without any error.

**Return**

- true
- false

**Parameters**

- `client`: The esp_http_client handle

**Structures**

**struct esp_http_client_event**

HTTP Client events data.
Public Members

*esp_http_client_event_id_t* **event_id**
- event_id, to know the cause of the event

*esp_http_client_handle_t* **client**
- esp_http_client_handle_t context

void **data**
- data of the event

int **data_len**
- data length of data

void **user_data**
- user_data context, from *esp_http_client_config_t* user_data

char **header_key**
- For HTTP_EVENT_ON_HEADER event_id, it’s store current http header key

char **header_value**
- For HTTP_EVENT_ON_HEADER event_id, it’s store current http header value

```c
struct esp_http_client_config_t
```
- HTTP configuration.

Public Members

```c
const char *url
```
- HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

```c
const char *host
```
- Domain or IP as string

int **port**
- Port to connect, default depend on esp_http_client_transport_t (80 or 443)

```c
const char *username
```
- Using for Http authentication

```c
const char *password
```
- Using for Http authentication

```c
const char *auth_type
```
- Http authentication type, see *esp_http_client_auth_type_t*

```c
const char *path
```
- HTTP Path, if not set, default is /

```c
const char *query
```
- HTTP query

```c
const char *cert_pem
```
- SSL server certification, PEM format as string, if the client requires to verify server

```c
const char *client_cert_pem
```
- SSL client certification, PEM format as string, if the server requires to verify client

```c
const char *client_key_pem
```
- SSL client key, PEM format as string, if the server requires to verify client
```c
#include "esp_http_client.h"

esp_http_client_method_t method
   HTTP Method

int timeout_ms
   Network timeout in milliseconds

bool disable_auto_redirect
   Disable HTTP automatic redirects

int max_redirection_count
   Max redirection number, using default value if zero

http_event_handle_cb event_handler
   HTTP Event Handle

esp_http_client_transport_t transport_type
   HTTP transport type, see esp_http_client_transport_t

int buffer_size
   HTTP receive buffer size

int buffer_size_tx
   HTTP transmit buffer size

void *user_data
   HTTP user_data context

bool is_async
   Set asynchronous mode, only supported with HTTPS for now

bool use_global_ca_store
   Use a global ca_store for all the connections in which this bool is set.

bool skip_cert_common_name_check
   Skip any validation of server certificate CN field

Macros

#define DEFAULT_HTTP_BUF_SIZE

#define ESP_ERR_HTTP_BASE
   Starting number of HTTP error codes

#define ESP_ERR_HTTP_MAX_REDIRECT
   The error exceeds the number of HTTP redirects

#define ESP_ERR_HTTP_CONNECT
   Error open the HTTP connection

#define ESP_ERR_HTTP_WRITE_DATA
   Error write HTTP data

#define ESP_ERR_HTTP_FOOT_HEADER
   Error read HTTP header from server

#define ESP_ERR_HTTP_INVALID_TRANSPORT
   There are no transport support for the input scheme

#define ESP_ERR_HTTP_CONNECTING
   HTTP connection hasn’t been established yet
```
**ESP_ERR_HTTP_EAGAIN**

Mapping of errno EAGAIN to esp_err_t

### Type Definitions

```c
typedef struct esp_http_client *esp_http_client_handle_t
typedef struct esp_http_client_event *esp_http_client_event_handle_t
typedef struct esp_http_client_event esp_http_client_event_t
HTTP Client events data.
typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)

### Enumerations

```c
enum esp_http_client_event_id_t
HTTP Client events id.

Values:

HTTP_EVENT_ERROR = 0
This event occurs when there are any errors during execution

HTTP_EVENT_ON_CONNECTED
Once the HTTP has been connected to the server, no data exchange has been performed

HTTP_EVENT_HEADERS_SENT
After sending all the headers to the server

HTTP_EVENT_HEADER_SENT = HTTP_EVENT_HEADERS_SENT
This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

HTTP_EVENT_ON_HEADER
Occurs when receiving each header sent from the server

HTTP_EVENT_ON_DATA
Occurs when receiving data from the server, possibly multiple portions of the packet

HTTP_EVENT_ON_FINISH
Occurs when finish a HTTP session

HTTP_EVENT_DISCONNECTED
The connection has been disconnected

enum esp_http_client_transport_t
HTTP Client transport.

Values:

HTTP_TRANSPORT_UNKNOWN = 0x0
Unknown

HTTP_TRANSPORT_OVER_TCP
Transport over tcp

HTTP_TRANSPORT_OVER_SSL
Transport over ssl

2.4. Application Protocols
enum esp_http_client_method_t
    HTTP method.
    Values:
    
    HTTP_METHOD_GET = 0
        HTTP GET Method
    HTTP_METHOD_POST
        HTTP POST Method
    HTTP_METHOD_PUT
        HTTP PUT Method
    HTTP_METHOD_PATCH
        HTTP PATCH Method
    HTTP_METHOD_DELETE
        HTTP DELETE Method
    HTTP_METHOD_HEAD
        HTTP HEAD Method
    HTTP_METHOD_NOTIFY
        HTTP NOTIFY Method
    HTTP_METHOD_SUBSCRIBE
        HTTP SUBSCRIBE Method
    HTTP_METHOD_UNSUBSCRIBE
        HTTP UNSUBSCRIBE Method
    HTTP_METHOD_OPTIONS
        HTTP OPTIONS Method
    HTTP_METHOD_MAX

enum esp_http_client_auth_type_t
    HTTP Authentication type.
    Values:
    
    HTTP_AUTH_TYPE_NONE = 0
        No authentication
    HTTP_AUTH_TYPE_BASIC
        HTTP Basic authentication
    HTTP_AUTH_TYPE_DIGEST
        HTTP Digest authentication

enum HttpStatus_Code
    Enum for the HTTP status codes.
    Values:
    
    HttpStatus_MovedPermanently = 301
    HttpStatus_Found = 302
    HttpStatus_TemporaryRedirect = 307
    HttpStatus_Unauthorized = 401
2.4.5 HTTP Server

Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32. Following are detailed steps to use the API exposed by HTTP Server:

- **httpd_start()**: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing httpd_config_t structure to httpd_start(). TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.

- **httpd_stop()**: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.

- **httpd_register_uri_handler()**: A URI handler is registered by passing object of type httpd_uri_t structure which has members including uri name, method type (eg. HTTPD_GET/HTTPD_POST/HTTPD_PUT etc.), function pointer of type esp_err_t *handler (httpd_req_t *req) and user_ctx pointer to user context data.

Application Example

```c
/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, strlen(resp));
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request. */
    /* httpd_req_recv() accepts char* only, but content could */
    /* as well be any binary data (needs type casting). */
    /* In case of string data, null termination will be absent, and */
    /* content length would give length of string */
    char[100] content;

    /* Truncate if content length larger than the buffer */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) { /* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling */
        }
    }
}
```

(continues on next page)
* httpd_req_recv(), but to keep it simple, here we
* respond with an HTTP 408 (Request Timeout) error */
    httpd_resp_send_408(req);
}
/* In case of error, returning ESP_FAIL will
* ensure that the underlying socket is closed */
    return ESP_FAIL;
}
/* Send a simple response */
    const char resp[] = "URI POST Response";
    httpd_resp_send(req, resp, strlen(resp));
    return ESP_OK;
}
/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri = "/uri",
    .method = HTTP_GET,
    .handler = get_handler,
    .user_ctx = NULL
};
/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri = "/uri",
    .method = HTTP_POST,
    .handler = post_handler,
    .user_ctx = NULL
};
/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    } /* If server failed to start, handle will be NULL */
    return server;
}
/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}
Simple HTTP server example

Check HTTP server example under protocols/http_server/simple where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

Persistent Connections Example

```c
/*@ Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /* Pointer to context data */
        req->free_ctx = free_ctx_func; /* Function to free context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;

    /* Respond */
    ...............
    ...............
    ...............
    return ESP_OK;
}
```

Check the example under protocols/http_server/persistent_sockets.

2.4. Application Protocols
Functions

`esp_err_t httpd_register_uri_handler(httpd_handle_t handle, const httpd_uri_t *uri_handler)`

Registers a URI handler.

Example usage:

```c
esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv, Process and Send
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri = "/my_uri/path/xyz",
    .method = HTTPD_GET,
    .handler = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}
```

**Note** URI handlers can be registered in real time as long as the server handle is valid.

**Return**

- ESP_OK: On successfully registering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_HANDLERS_FULL: If no slots left for new handler
- ESP_ERR_HTTPD_HANDLER_EXISTS: If handler with same URI and method is already registered

**Parameters**

- handle: handle to HTTPD server instance
- uri_handler: pointer to handler that needs to be registered

`esp_err_t httpd_unregister_uri_handler(httpd_handle_t handle, const char *uri, httpd_method_t method)`

Unregister a URI handler.
Return

• ESP_OK : On successfully deregistering the handler
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_NOT_FOUND : Handler with specified URI and method not found

Parameters

• handle: handle to HTTPD server instance
• uri: URI string
• method: HTTP method

\[
\text{esp_err_t } \text{httpd_unregister_uri}\left( \text{httpd_handle_t handle, const char } \ast \text{uri} \right)
\]
Unregister all URI handlers with the specified uri string.

Return

• ESP_OK : On successfully deregistering all such handlers
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_NOT_FOUND : No handler registered with specified uri string

Parameters

• handle: handle to HTTPD server instance
• uri: uri string specifying all handlers that need to be deregisterd

\[
\text{esp_err_t } \text{httpd_sess_set_recv_override}\left( \text{httpd_handle_t hd, int sockfd, httpd_recv_func_t recv_func} \right)
\]
Override web server’s receive function (by session FD)

This function overrides the web server’s receive function. This same function is used to read HTTP request packets.

Note This API is supposed to be called either from the context of
• an http session APIs where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Return

• ESP_OK : On successfully registering override
• ESP_ERR_INVALID_ARG : Null arguments

Parameters

• hd: HTTPD instance handle
• sockfd: Session socket FD
• recv_func: The receive function to be set for this session

\[
\text{esp_err_t } \text{httpd_sess_set_send_override}\left( \text{httpd_handle_t hd, int sockfd, httpd_send_func_t send_func} \right)
\]
Override web server’s send function (by session FD)

This function overrides the web server’s send function. This same function is used to send out any response to any HTTP request.
Note This API is supposed to be called either from the context of
• an http session APIs where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Return
• ESP_OK : On successfully registering override
• ESP_ERR_INVALID_ARG : Null arguments

Parameters
• hd: HTTPD instance handle
• sockfd: Session socket FD
• send_func: The send function to be set for this session

esp_err_t httpd_sess_set_pending_override (httpd_handle_t hd, int sockfd, httpd_pending_func_t pending_func)
Override web server's pending function (by session FD)
This function overrides the web server's pending function. This function is used to test for pending bytes in a
socket.

Note This API is supposed to be called either from the context of
• an http session APIs where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Return
• ESP_OK : On successfully registering override
• ESP_ERR_INVALID_ARG : Null arguments

Parameters
• hd: HTTPD instance handle
• sockfd: Session socket FD
• pending_func: The receive function to be set for this session

int httpd_req_to_sockfd (httpd_req_t *r)
Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of
HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI
handler, ie. : httpd_sess_get_ctx(), httpd_sess_trigger_close(), httpd_sess_update_lru_counter().

Note This API is supposed to be called only from the context of a URI handler where httpd_req_t* request
pointer is valid.

Return
• Socket descriptor : The socket descriptor for this request
• -1 : Invalid(NULL) request pointer

Parameters
• r: The request whose socket descriptor should be found
int `httpd_req_recv` (`httpd_req_t *r, char *buf, size_t buf_len`)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use `content_len` provided in `httpd_req_t` structure to know the length of data to be fetched. If `content_len` is too large for the buffer then user may have to make multiple calls to this function, each time fetching `buf_len` number of bytes, while the pointer to content data is incremented internally by the same number.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

**Return**

- Bytes: Number of bytes read into the buffer successfully
- 0: Buffer length parameter is zero / connection closed by peer
- `HTTPD_SOCK_ERR_INVALID`: Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT`: Timeout/interrupted while calling socket `recv()`
- `HTTPD_SOCK_ERR_FAIL`: Unrecoverable error while calling socket `recv()`

**Parameters**

- `r`: The request being responded to
- `buf`: Pointer to a buffer that the data will be read into
- `buf_len`: Length of the buffer

```c
size_t `httpd_req_get_hdr_value_len` (`httpd_req_t *r, const char *field`)  

Search for a field in request headers and return the string length of it's value.
```

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**

- Length: If field is found in the request URL
- Zero: Field not found / Invalid request / Null arguments

**Parameters**

- `r`: The request being responded to
- `field`: The header field to be searched in the request

```c
esp_err_t `httpd_req_get_hdr_value_str` (`httpd_req_t *r, const char *field`, char *val, size_t val_size`)  

Get the value string of a field from the request headers.
```
Note

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use httpd_req_get_hdr_value_len() to know the right buffer length

Return

- ESP_OK : Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

Parameters

- r: The request being responded to
- field: The field to be searched in the header
- val: Pointer to the buffer into which the value will be copied if the field is found
- val_size: Size of the user buffer “val”

size_t httpd_req_get_url_query_len(httpd_req_t*r)
Get Query string length from the request URL.

Note This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid

Return

- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

Parameters

- r: The request being responded to

esp_err_t httpd_req_get_url_query_str(httpd_req_t*r, char *buf, size_t buf_len)
Get Query string from the request URL.

Note

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using httpd_req_get_hdr_value_str() to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid
• If output size is greater than input, then the value is truncated, accompanied by truncation error as return value

• Prior to calling this function, one can use httpd_req_get_url_query_len() to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

Return

• ESP_OK : Query is found in the request URL and copied to buffer

• ESP_ERR_NOT_FOUND : Query not found

• ESP_ERR_INVALID_ARG : Null arguments

• ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer

• ESP_ERR_HTTPD_RESULT_TRUNC : Query string truncated

Parameters

• r: The request being responded to

• buf: Pointer to the buffer into which the query string will be copied (if found)

• buf_len: Length of output buffer

esp_err_t httpd_query_key_value(const char *qry, const char *key, char *val, size_t val_size)

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

Note

• The components of URL query string (keys and values) are not URLdecoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (UR-Lencoded or otherwise) apply the appropriate decoding algorithm.

• If actual value size is greater than val_size, then the value is truncated, accompanied by truncation error as return value.

Return

• ESP_OK : Key is found in the URL query string and copied to buffer

• ESP_ERR_NOT_FOUND : Key not found

• ESP_ERR_INVALID_ARG : Null arguments

• ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

Parameters

• qry: Pointer to query string

• key: The key to be searched in the query string

• val: Pointer to the buffer into which the value will be copied if the key is found

• val_size: Size of the user buffer “val”

bool httpd_uri_match_wildcard(const char *uri_template, const char *uri_to_match, size_t match_up_to)

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “*” for a wildcard match, and “*?” to make the previous character optional, and if present, allow anything to follow.

Example:
• * matches everything
• /foo/ matches /foo and /foo/
• /foo/* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
• /foo/*? or /foo/?? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “*” anywhere else in the template will be taken literally.

Return true if a match was found

Parameters
• uri_template: URI template (pattern)
• uri_to_match: URI to be matched
• match_upto: how many characters of the URI buffer to test (there may be trailing query string etc.)

esp_err_t httpd_resp_send(httpd_req_t *r, const char *buf, ssize_t buf_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use httpd_resp_send_chunk() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers: httpd_resp_set_status() - for setting the HTTP status string, httpd_resp_set_type() - for setting the Content Type, httpd_resp_set_hdr() - for appending any additional field value entries in the response header

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, the request has been responded to.
• No additional data can then be sent for the request.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request

Parameters
• r: The request being responded to
• buf: Buffer from where the content is to be fetched
• buf_len: Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()
esp_err_t httpd_resp_send_chunk (httpd_req_t *r, const char *buf, ssize_t buf_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use httpd_resp_send() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers httpd_resp_set_status() - for setting the HTTP status string, httpd_resp_set_type() - for setting the Content Type, httpd_resp_set_hdr() - for appending any additional field value entries in the response header.

Note

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- When you are finished sending all your chunks, you must call this function with buf_len as 0.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return

- ESP_OK : On successfully sending the response packet chunk
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters

- r: The request being responded to
- buf: Pointer to a buffer that stores the data
- buf_len: Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

static esp_err_t httpd_resp_sendstr (httpd_req_t *r, const char *str)

API to send a complete string as HTTP response.

This API simply calls http_resp_send with buffer length set to string length assuming the buffer contains a null terminated string.

Return

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

Parameters

- r: The request being responded to
- str: String to be sent as response body

2.4. Application Protocols
static esp_err_t httpd_resp_sendstr_chunk (httpd_req_t *r, const char *str)

API to send a string as an HTTP response chunk.

This API simply calls http_resp_send_chunk with buffer length set to string length assuming the buffer contains a null terminated string

Return

• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request

Parameters

• r : The request being responded to
• str : String to be sent as response body (NULL to finish response packet)

esp_err_t httpd_resp_set_status (httpd_req_t *r, const char *status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

Note

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
• Make sure that the lifetime of the status string is valid till send function is called.

Return

• ESP_OK : On success
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters

• r : The request being responded to
• status : The HTTP status code of this response

esp_err_t httpd_resp_set_type (httpd_req_t *r, const char *type)

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

Note

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
• Make sure that the lifetime of the type string is valid till send function is called.

Return
• ESP_OK : On success
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
• r: The request being responded to
• type: The Content Type of the response

```
esp_err_t httpd_resp_set_hdr (httpd_req_t *r, const char *field, const char *value)
```

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• The header isn’t sent out until any of the send APIs is executed.
• The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
• Make sure that the lifetime of the field value strings are valid till send function is called.

Return
• ESP_OK : On successfully appending new header
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_HDR : Total additional headers exceed max allowed
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
• r: The request being responded to
• field: The field name of the HTTP header
• value: The value of this HTTP header

```
esp_err_t httpd_resp_send_err (httpd_req_t *req, httpd_err_code_t error, const char *msg)
```

For sending out error code in response to HTTP request.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
• If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Return
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
• req : Pointer to the HTTP request for which the response needs to be sent
• error : Error type to send
• msg : Error message string (pass NULL for default message)

static esp_err_t httpd_resp_send_404 (httpd_req_t *r)
Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
• r : The request being responded to

static esp_err_t httpd_resp_send_408 (httpd_req_t *r)
Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters

• \texttt{r} : The request being responded to

\textbf{static} \texttt{esp_err_t httpd_resp_send_500 (httpd_req_t \*r)}

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

\textbf{Note}

• This API is supposed to be called only from the context of a URI handler where \texttt{httpd Req_t*} request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

\textbf{Return}

• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters

• \texttt{r} : The request being responded to

\textbf{int httpd_send (httpd Req_t \*r, const char \*buf, size_t buf_len)}

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

\textbf{Note}

• This API is supposed to be called only from the context of a URI handler where \texttt{httpd Req_t*} request pointer is valid.
• Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn’t have to call this API, but you would rather use either of : \texttt{httpd Resp_send()}, \texttt{httpd Resp_send_chunk()}

\textbf{Return}

• Bytes : Number of bytes that were sent successfully
• HTTPD.SOCK.ERR.INVALID : Invalid arguments
• HTTPD.SOCK.ERR.TIMEOUT : Timeout/interrupted while calling socket send()
• HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

Parameters
• r: The request being responded to
• buf: Buffer from where the fully constructed packet is to be read
• buf_len: Length of the buffer

\[ \text{esp_err_t} \text{httpd_register_err_handler} (\text{httpd_handle_t} \ handle, \ \text{httpd_err_code_t} \ error, \ \text{httpd_err_handler_func_t} \ \text{handler_fn}) \]

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by \text{httpd_err_code_t}. See prototype \text{httpd_err_handler_func_t} above for details.

Return
• ESP_OK : handler registered successfully
• ESP_ERR_INVALID_ARG : invalid error code or server handle

Parameters
• handle: HTTP server handle
• error: Error type
• handler_fn: User implemented handler function (Pass NULL to unset any previously set handler)

\[ \text{esp_err_t} \text{httpd_start} (\text{httpd_handle_t} *\text{handle}, \ \text{const} \ \text{httpd_config_t} *\text{config}) \]

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```c
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }

    // If server failed to start, handle will be NULL
    return server;
}
```

Return
• ESP_OK : Instance created successfully
• ESP_ERR_INVALID_ARG : Null argument(s)
- ESP_ERR_HTTPD_ALLOC_MEM: Failed to allocate memory for instance
- ESP_ERR_HTTPD_TASK: Failed to launch server task

**Parameters**

- `config`: Configuration for new instance of the server
- `handle`: Handle to newly created instance of the server. NULL on error

```c
void httpd_stop(httpd_handle_t handle)
```

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```c
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

**Return**

- ESP_OK: Server stopped successfully
- ESP_ERR_INVALID_ARG: Handle argument is Null

**Parameters**

- `handle`: Handle to server returned by httpd_start

```c
void httpd_queue_work(httpd_handle_t handle, httpd_work_fn_t work, void *arg)
```

Queue execution of a function in HTTPD’s context.

This API queues a work function for asynchronous execution

**Note** Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

**Return**

- ESP_OK: On successfully queueing the work
- ESP_FAIL: Failure in ctrl socket
- ESP_ERR_INVALID_ARG: Null arguments

**Parameters**

- `handle`: Handle to server returned by httpd_start
- `work`: Pointer to the function to be executed in the HTTPD’s context
- `arg`: Pointer to the arguments that should be passed to this function
void *httpd_sess_get_ctx(httpd_handle_t handle, int sockfd)
Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure. But, there are cases where the web server’s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

**Return**

- void*: Pointer to the context associated with this session
- NULL: Empty context / Invalid handle / Invalid socket fd

**Parameters**

- handle: Handle to server returned by httpd_start
- sockfd: The socket descriptor for which the context should be extracted.

void httpd_sess_set_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
Set session context by socket descriptor.

**Parameters**

- handle: Handle to server returned by httpd_start
- sockfd: The socket descriptor for which the context should be extracted.
- ctx: Context object to assign to the session
- free_fn: Function that should be called to free the context

void *httpd_sess_get_transport_ctx(httpd_handle_t handle, int sockfd)
Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

**See** httpd_sess_get_ctx()

**Return**

- void*: Pointer to the transport context associated with this session
- NULL: Empty context / Invalid handle / Invalid socket fd

**Parameters**

- handle: Handle to server returned by httpd_start
- sockfd: The socket descriptor for which the context should be extracted.

void httpd_sess_set_transport_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
Set session ‘transport’ context by socket descriptor.

**See** httpd_sess_set_ctx()

**Parameters**

- handle: Handle to server returned by httpd_start
- sockfd: The socket descriptor for which the context should be extracted.
- ctx: Transport context object to assign to the session
**free_fn**: Function that should be called to free the transport context

```c
void *httpd_get_global_user_ctx(httpd_handle_t handle)
```
Get HTTPD global user context (it was set in the server config struct)

**Return** global user context

**Parameters**
- `handle`: Handle to server returned by httpd_start

```c
void *httpd_get_global_transport_ctx(httpd_handle_t handle)
```
Get HTTPD global transport context (it was set in the server config struct)

**Return** global transport context

**Parameters**
- `handle`: Handle to server returned by httpd_start

```c
esp_err_t httpd_sess_trigger_close(httpd_handle_t handle, int sockfd)
```
Trigger an httpd session close externally.

**Note** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

**Return**
- `ESP_OK`: On successfully initiating closure
- `ESP_FAIL`: Failure to queue work
- `ESP_ERR_NOT_FOUND`: Socket fd not found
- `ESP_ERR_INVALID_ARG`: Null arguments

**Parameters**
- `handle`: Handle to server returned by httpd_start
- `sockfd`: The socket descriptor of the session to be closed

```c
esp_err_t httpd_sess_update_lru_counter(httpd_handle_t handle, int sockfd)
```
Update LRU counter for a given socket.

**Note** Calling this API is only necessary if the LRU Purge Enable option is enabled.

**Return**
- `ESP_OK`: Socket found and LRU counter updated
- `ESP_ERR_NOT_FOUND`: Socket not found
- `ESP_ERR_INVALID_ARG`: Null arguments

2.4. Application Protocols
Parameters

- **handle**: Handle to server returned by httpd_start
- **sockfd**: The socket descriptor of the session for which LRU counter is to be updated

Structures

```c
struct httpd_config
HTTP Server Configuration Structure.
```

**Note** Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

Public Members

unsigned **task_priority**
Priority of FreeRTOS task which runs the server

size_t **stack_size**
The maximum stack size allowed for the server task

BaseType_t **core_id**
The core the HTTP server task will run on

uint16_t **server_port**
TCP Port number for receiving and transmitting HTTP traffic

uint16_t **ctrl_port**
UDP Port number for asynchronously exchanging control signals between various components of the server

uint16_t **max_opensockets**
Max number of sockets/clients connected at any time

uint16_t **max_urihandlers**
Maximum allowed uri handlers

uint16_t **max_respheaders**
Maximum allowed additional headers in HTTP response

uint16_t **backlog_conn**
Number of backlog connections

bool **lru_purge_enable**
Purge “Least Recently Used” connection

uint16_t **recv_wait_timeout**
Timeout for recv function (in seconds)

uint16_t **send_wait_timeout**
Timeout for send function (in seconds)

void **global_user_ctx**
Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the httpd_req_t struct.
When shutting down, the server frees up the user context by calling free() on the global_user_ctx field. If you wish to use a custom function for freeing the global user context, please specify that here.

`httpd_free_ctx_fn_t global_user_ctx_free_fn`
Free function for global user context

`void *global_transport_ctx`
Global transport context.

Similar to global_user_ctx, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using free(), unless global_transport_ctx_free_fn is specified.

`httpd_free_ctx_fn_t global_transport_ctx_free_fn`
Free function for global transport context

`httpd_open_func_t open_fn`
Custom session opening callback.

Called on a new session socket just after accept(), but before reading any data.

This is an opportunity to set up e.g. SSL encryption using global_transport_ctx and the send/recv/pending session overrides.

If a context needs to be maintained between these functions, store it in the session using httpd_sess_set_transport_ctx() and retrieve it later with httpd_sess_get_transport_ctx()

Returning a value other than ESP_OK will immediately close the new socket.

`httpd_close_func_t close_fn`
Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket.

This is a place for custom de-init code common to all sockets.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

`httpd_uri_match_func_t uri_match_fn`
URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) NULL : Internally do basic matching using `strncmp()` 2) `httpd_uri_matchWildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the httpd_uri_match_func_t function prototype)

`struct httpd_req`
HTTP Request Data Structure.

**Public Members**

`httpd_handle_t handle`
Handle to server instance

`int method`
The type of HTTP request, -1 if unsupported method
const char uri[HTTPD_MAX_URI_LEN + 1]
   The URI of this request (1 byte extra for null termination)

size_t content_len
   Length of the request body

void *aux
   Internally used members

void *user_ctx
   User context pointer passed during URI registration.

void *sess_ctx
   Session Context Pointer
   A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One
   session could have multiple request responses. The web server will ensure that the context persists across
   all these request and responses.

   By default, this is NULL. URI Handlers can set this to any meaningful value.

   If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context
   by calling free(), unless free_ctx function is set.

httpd_free_ctx_fn_t free_ctx
   Pointer to free context hook
   Function to free session context
   If the web server’s socket closes, it frees up the session context by calling free() on the sess_ctx member.
   If you wish to use a custom function for freeing the session context, please specify that here.

bool ignore_sess_ctx_changes
   Flag indicating if Session Context changes should be ignored
   By default, if you change the sess_ctx in some URI handler, the http server will internally free the
   earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any
   checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets
   closed.

struct httpd_uri
   Structure for URI handler.

Public Members

const char *uri
   The URI to handle

httpd_method_t method
   Method supported by the URI

esp_err_t (*handler)(httpd_req_t *r)
   Handler to call for supported request method. This must return ESP_OK, or else the underlying socket
   will be closed.

void *user_ctx
   Pointer to user context data which will be available to handler
Macros

HTTPD_MAX_REQ_HDR_LEN
HTTPD_MAX_URI_LEN
HTTPD_SOCK_ERR_FAIL
HTTPD_SOCK_ERR_INVALID
HTTPD_SOCK_ERR_TIMEOUT
HTTPD_200
  HTTP Response 200
HTTPD_204
  HTTP Response 204
HTTPD_207
  HTTP Response 207
HTTPD_400
  HTTP Response 400
HTTPD_404
  HTTP Response 404
HTTPD_408
  HTTP Response 408
HTTPD_500
  HTTP Response 500
HTTPD_TYPE_JSON
  HTTP Content type JSON
HTTPD_TYPE_TEXT
  HTTP Content type text/HTML
HTTPD_TYPE_OCTET
  HTTP Content type octtext-stream
HTTPD_DEFAULT_CONFIG
  ()
ESP_ERR_HTTPD_BASE
  Starting number of HTTPD error codes
ESP_ERR_HTTPD_HANDLERS_FULL
  All slots for registering URI handlers have been consumed
ESP_ERR_HTTPD_HANDLER_EXISTS
  URI handler with same method and target URI already registered
ESP_ERR_HTTPD_INVALID_REQ
  Invalid request pointer
ESP_ERR_HTTPD_RESULT_TRUNC
  Result string truncated
ESP_ERR_HTTPD_RESP_HDR
  Response header field larger than supported
ESP_ERR_HTTPD_RESP_SEND
  Error occured while sending response packet

2.4. Application Protocols
ESP_ERR_HTTPD_ALLOC_MEM
Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK
Failed to launch server task/thread

HTTPD_RESP_USE_STRLEN

Type Definitions

typedef struct httpd_req httpd_req_t
HTTP Request Data Structure.

typedef struct httpd_uri httpd_uri_t
Structure for URI handler.

typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
Prototype for HTTPDs low-level send function.

Note User specified send function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_send() function

Return
• Bytes : The number of bytes sent successfully
• HTTPD_SOCK_ERR_INVALID : Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
• HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

Parameters
• hd: server instance
• sockfd: session socket file descriptor
• buf: buffer with bytes to send
• buf_len: data size
• flags: flags for the send() function

typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
Prototype for HTTPDs low-level recv function.

Note User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function

Return
• Bytes : The number of bytes received successfully
• 0 : Buffer length parameter is zero / connection closed by peer
• HTTPD_SOCK_ERR_INVALID : Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
• HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()
Parameters

- **hd**: server instance
- **sockfd**: session socket file descriptor
- **buf**: buffer with bytes to send
- **buf_len**: data size
- **flags**: flags for the send() function

```c
typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
```
Prototype for HTTPD's low-level "get pending bytes" function.

**Note** User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will be handled accordingly in the server task.

**Return**
- **Bytes**: The number of bytes waiting to be received
- **HTTPD_SOCK_ERR_INVALID**: Invalid arguments
- **HTTPD_SOCK_ERR_TIMEOUT**: Timeout/interrupted while calling socket pending()
- **HTTPD_SOCK_ERR_FAIL**: Unrecoverable error while calling socket pending()

Parameters

- **hd**: server instance
- **sockfd**: session socket file descriptor

```c
typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
```
Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

**Note**
- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd_resp_send_err() must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of *uri, method, content_len* and *user_ctx* fields of the *httpd_req_t* parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD_500_INTERNAL_SERVER_ERROR and the socket closed anyway.

**Return**
- **ESP_OK**: error handled successful
- **ESP_FAIL**: failure indicates that the underlying socket needs to be closed

Parameters

- **req**: HTTP request for which the error needs to be handled
- **error**: Error type
typedef void *httpd_handle_t
HTTP Server Instance Handle.
Every instance of the server will have a unique handle.

typedef enum http_method httpd_method_t
HTTP Method Type wrapper over “enum http_method” available in “http_parser” library.

typedef void (*httpd_free_ctx_fn_t)(void *ctx)
Prototype for freeing context data (if any)

Parameters

• ctx: object to free

typedef esp_err_t (*httpd_open_func_t)(httpd_handle_t hd, int sockfd)
Function prototype for opening a session.
Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

Return

• ESP_OK : On success
• Any value other than ESP_OK will signal the server to close the socket immediately

Parameters

• hd: server instance
• sockfd: session socket file descriptor

typedef void (*httpd_close_func_t)(httpd_handle_t hd, int sockfd)
Function prototype for closing a session.

Note It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

Parameters

• hd: server instance
• sockfd: session socket file descriptor

typedef bool (*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)
Function prototype for URI matching.

Return true on match

Parameters

• reference_uri: URI/template with respect to which the other URI is matched
• uri_to_match: URI/template being matched to the reference URI/template
• match_upto: For specifying the actual length of uri_to_match up to which the matching algorithm is to be applied (The maximum value is strlen(uri_to_match), independent of the length of reference_uri)

typedef struct httpd_config httpd_config_t
HTTP Server Configuration Structure.
Note Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

```
typedef void (*httpd_work_fn_t)(void *arg)
```
Prototype of the HTTPD work function Please refer to httpd_queue_work() for more details.

Parameters

- `arg`: The arguments for this work function

Enumerations

```
enum httpd_err_code_t
```
Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

Values:

HTTPD_500_INTERNAL_SERVER_ERROR = 0
HTTPD_501_METHOD_NOT_IMPLEMENTED
HTTPD_505_VERSION_NOT_SUPPORTED
HTTPD_400_BAD_REQUEST
HTTPD_404_NOT_FOUND
HTTPD_405_METHOD_NOT_ALLOWED
HTTPD_408_REQ_TIMEOUT
HTTPD_411_LENGTH_REQUIRED
HTTPD_414_URI_TOO_LONG
HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE
HTTPD_ERR_CODE_MAX

2.4.6 HTTPS server

Overview

This component is built on top of esp_http_server. The HTTPS server takes advantage of hooks and function overrides in the regular HTTP server to provide encryption using OpenSSL.

All documentation for esp_http_server applies also to a server you create this way.

Used APIs

The following API of esp_http_server should not be used with esp_https_server, as they are used internally to handle secure sessions and to maintain internal state:

- “send”, “receive” and “pending” function overrides - secure socket handling
  - `httpd_sess_set_send_override()`
  - `httpd_sess_set_recv_override()`
  - `httpd_sess_set_pending_override()`
• “transport context” - both global and session
  – `httpd_sess_get_transport_ctx()` - returns SSL used for the session
  – `httpd_sess_set_transport_ctx()`
  – `httpd_get_global_transport_ctx()` - returns the shared SSL context
    - `httpd_config_t.global_transport_ctx`
    - `httpd_config_t.global_transport_ctx_free_fn`
    - `httpd_config_t.open_fn` - used to set up secure sockets

Everything else can be used without limitations.

Usage

Please see the example protocols/https_server to learn how to set up a secure server.

Basically all you need is to generate a certificate, embed it in the firmware, and provide its pointers and lengths to the start function via the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config.transport_mode`. This could be used e.g. for testing or in trusted environments where you prefer speed over security.

Performance

The initial session setup can take about two seconds, or more with slower clock speeds or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

API Reference

Header File

• esp_https_server/include/esp_https_server.h

Functions

`esp_err_t httpd_ssl_start(httpd_handle_t *handle, httpd_ssl_config_t *config)`

Create a SSL capable HTTP server (secure mode may be disabled in config)

Return  success

Parameters

  • `config`: - server config, must not be const. Does not have to stay valid after calling this function.
  • `handle`: - storage for the server handle, must be a valid pointer

void `httpd_ssl_stop(httpd_handle_t handle)`

Stop the server. Blocks until the server is shut down.

Parameters

  • `handle`:
Structures

struct httpd_ssl_config
  HTTPS server config struct
  Please use HTTPD_SSL_CONFIG_DEFAULT() to initialize it.

Public Members

httpd_config_t httpd
  Underlying HTTPD server config
  Parameters like task stack size and priority can be adjusted here.

const uint8_t * cacert_pem
  CA certificate

size_t cacert_len
  CA certificate byte length

const uint8_t * prvtkey_pem
  Private key

size_t prvtkey_len
  Private key byte length

httpd_ssl_transport_mode_t transport_mode
  Transport Mode (default secure)

uint16_t port_secure
  Port used when transport mode is secure (default 443)

uint16_t port_insecure
  Port used when transport mode is insecure (default 80)

Macros

HTTPD_SSL_CONFIG_DEFAULT()
  Default config struct init
  (http_server default config had to be copied for customization)

Notes:
  • port is set when starting the server, according to 'transport_mode'
  • one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
  • SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
  • Stack size may need adjustments depending on the user application

Type Definitions

typedef struct httpd_ssl_config httpd_ssl_config_t
Enumerations

```c
enum httpd_ssl_transport_mode_t {
    HTTPD_SSL_TRANSPORT_SECURE,
    HTTPD_SSL_TRANSPORT_INSECURE,
};
```

2.4.7 ICMP Echo

Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network utility ping is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

Create a new ping session

To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```c
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
           recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}
```

```c
static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
```

```c
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;
    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    getaddrinfo("www.espressif.com", NULL, &hint, &res) == 0);
    struct in_addr addr4 = (((struct sockaddr_in *) (res->ai_addr))->sin_addr)
        inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);
    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr; // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE; // ping in infinite mode, esp_ping_stop can stop it
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo"; // arguments that will feed to all callback functions, can be NULL
    cbs.cb_args = eth_event_group;
    esp_ping_new_session(&ping, &cbs, &ping);
}
```

### Start and Stop ping session

You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won’t start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

---

2.4. Application Protocols 1011
Delete a ping session

If a ping session won’t be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

Get runtime statistics

As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: `protocols/icmp_echo`

API Reference

Header File

- `lwip/include/apps/ping/ping_sock.h`

Functions

```c
esp_err_t esp_ping_new_session(const esp_ping_config_t *config, const esp_ping_callbacks_t *cbs, esp_ping_handle_t *hdl_out)
```

Create a ping session.

Return

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP_ERR_NO_MEM: out of memory
- ESP_FAIL: other internal error (e.g. socket error)
- ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

Parameters

- `config`: ping configuration
- `cbs`: a bunch of callback functions invoked by internal ping task
- `hdl_out`: handle of ping session

```c
esp_err_t esp_ping_delete_session(esp_ping_handle_t hdl)
```

Delete a ping session.

Return

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully

Parameters
• hdl: handle of ping session

\texttt{esp_err_t esp_ping_start(esp_ping_handle_t hdl)}
\begin{quote}
Start the ping session.
\end{quote}

\textbf{Return}
\begin{itemize}
  \item ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
  \item ESP\_OK: start ping session successfully
\end{itemize}

\textbf{Parameters}
\begin{itemize}
  \item hdl: handle of ping session
\end{itemize}

\texttt{esp_err_t esp_ping_stop(esp_ping_handle_t hdl)}
\begin{quote}
Stop the ping session.
\end{quote}

\textbf{Return}
\begin{itemize}
  \item ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
  \item ESP\_OK: stop ping session successfully
\end{itemize}

\textbf{Parameters}
\begin{itemize}
  \item hdl: handle of ping session
\end{itemize}

\texttt{esp_err_t esp_ping_get_profile(esp_ping_handle_t hdl, esp_ping_profile_t profile, void *data, uint32_t size)}
\begin{quote}
Get runtime profile of ping session.
\end{quote}

\textbf{Return}
\begin{itemize}
  \item ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
  \item ESP\_ERR\_INVALID\_SIZE: the actual profile data size doesn’t match the “size” parameter
  \item ESP\_OK: get profile successfully
\end{itemize}

\textbf{Parameters}
\begin{itemize}
  \item hdl: handle of ping session
  \item profile: type of profile
  \item data: profile data
  \item size: profile data size
\end{itemize}

\textbf{Structures}

\textbf{struct esp_ping_callbacks_t}
\begin{quote}
Type of “ping” callback functions.
\end{quote}

\textbf{Public Members}

void *\textbf{cb_args}
\begin{quote}
arguments for callback functions
\end{quote}

\section{Application Protocols}
void (*on_ping_success)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when received ICMP echo reply packet.

void (*on_ping_timeout)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (*on_ping_end)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when a ping session is finished.

struct esp_ping_config_t
Type of “ping” configuration.

**Public Members**

uint32_t count
A “ping” session contains count procedures

uint32_t interval_ms
Milliseconds between each ping procedure

uint32_t timeout_ms
Timeout value (in milliseconds) of each ping procedure

uint32_t data_size
Size of the data next to ICMP packet header

uint8_t tos
Type of Service, a field specified in the IP header

ip_addr_t target_addr
Target IP address, either IPv4 or IPv6

uint32_t task_stack_size
Stack size of internal ping task

uint32_t task_prio
Priority of internal ping task

**Macros**

**ESP_PING_DEFAULT_CONFIG**
Default ping configuration.

**ESP_PING_COUNT_INFINITE**
Set ping count to zero will ping target infinitely

**Type Definitions**

typedef void *esp_ping_handle_t
Type of “ping” session handle.

**Enumerations**

typedef void *esp_ping_profile_t
Profile of ping session.
Values:

**ESP_PING_PROF_SEQNO**
Sequence number of a ping procedure

**ESP_PING_PROF_TTL**
Time to live of a ping procedure

**ESP_PING_PROF_REQUEST**
Number of request packets sent out

**ESP_PING_PROF_REPLY**
Number of reply packets received

**ESP_PING_PROF_IPADDR**
IP address of replied target

**ESP_PING_PROF_SIZE**
Size of received packet

**ESP_PING_PROF_TIMEGAP**
Elapsed time between request and reply packet

**ESP_PING_PROF_DURATION**
Elapsed time of the whole ping session

### 2.4.8 ESP Local Control

#### Overview

ESP Local Control (**esp_local_ctrl**) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined properties that are available for reading / writing via a set of configurable handlers.

Initialization of the **esp_local_ctrl** service over BLE transport is performed as follows:

```c
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <---------------------------------------*/
                /* ----------------------------------------> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        },
        .handlers = {
            /* User defined handler functions */
            .get_prop_values = get_property_values,
            .set_prop_values = set_property_values,
            .usr_ctx = NULL,
            .usr_ctx_free_fn = NULL
        },
        /* Maximum number of properties that may be set */
        .max_properties = 10
    }
};
```

(continues on next page)
Creating a property

Now that we know how to start the esp_local_ctrl service, let's add a property to it. Each property must have a unique name (string), a type (e.g. enum), flags (bit fields) and size.

The size is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the size field to the right value, helps esp_local_ctrl to perform internal checks on arguments received with write requests.

The interpretation of type and flags fields is totally upto the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use type values to classify properties, while flags to specify characteristics of a property.
Here is an example property which is to function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and `READONLY`, which are used for setting the type and flags fields here.

```c
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
  .name = "timestamp",
  .type = TYPE_TIMESTAMP,
  .size = sizeof(int32_t),
  .flags = READONLY,
  .ctx = func_get_time,
  .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a ctx field, which is set to point to some custom `func_get_time()`. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of `get_property_values()` handler, which is used for retrieving the timestamp.

```c
static esp_err_t get_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, esp_local_ctrl_prop_val_t *prop_values, void *usr_ctx)
{
  for (uint32_t i = 0; i < props_count; i++) {
    ESP_LOGI(TAG, "Reading %s", props[i].name);
    if (props[i].type == TYPE_TIMESTAMP) {
      /* Obtain the timer function from ctx */
      int32_t (*func_get_time)(void) = props[i].ctx;

      /* Use static variable for saving the value. 
       * This is essential because the value has to be 
       * valid even after this function returns. 
       * Alternative is to use dynamic allocation 
       * and set the free_fn field */
      static int32_t ts = func_get_time();
      prop_values[i].data = &ts;
    }
  }
  return ESP_OK;
}
```

Here is an example of `set_property_values()` handler. Notice how we restrict from writing to read-only properties.

```c
static esp_err_t set_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, const esp_local_ctrl_prop_val_t *prop_values, void *usr_ctx)
{
  for (uint32_t i = 0; i < props_count; i++) {
    if (props[i].flags & READONLY) {
      ESP_LOGE(TAG, "Cannot write to read-only property %s", props[i].name);
      return ESP_ERR_INVALID_ARG;
    } else {
      // (continues on next page)
    }
    return ESP_OK;
}
```

(continues on next page)
/* For keeping it simple, lets only log the incoming data */
ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                         prop_values[i].size, ESP_LOG_INFO);
}
}
return ESP_OK;
}

For complete example see protocols/esp_local_ctrl

**Client Side Implementation**

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the `esp_local_ctrl` service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the `esp_local_ctrl` service:

1. `get_prop_count` : This should simply return the total number of properties supported by the service
2. `get_prop_values` : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. `set_prop_values` : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call `get_prop_count` and then `get_prop_values`, hence form an index to name mapping for all properties. Now when calling `set_prop_values` for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by `esp_local_ctrl` are listed below:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (HTTPS Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_local_ctrl/version</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</td>
<td>Endpoint used for retrieving version string</td>
</tr>
<tr>
<td>esp_local_ctrl/control</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</td>
<td>Endpoint used for sending / receiving control messages</td>
</tr>
</tbody>
</table>

**API Reference**

**Header File**

- `esp_local_ctrl/include/esp_local_ctrl.h`
## Functions

**const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_ble (void)**
Function for obtaining BLE transport mode.

**const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_httpd (void)**
Function for obtaining HTTPD transport mode.

**esp_err_t esp_local_ctrl_start (const esp_local_ctrl_config_t *config)**
Start local control service.

- **Return**
  - ESP_OK : Success
  - ESP_FAIL : Failure

- **Parameters**
  - config: Pointer to configuration structure

**esp_err_t esp_local_ctrl_stop (void)**
Stop local control service.

**esp_err_t esp_local_ctrl_add_property (const esp_local_ctrl_prop_t *prop)**
Add a new property.

  This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

- **Return**
  - ESP_OK : Success
  - ESP_FAIL : Failure

- **Parameters**
  - prop: Property description structure

**esp_err_t esp_local_ctrl_remove_property (const char *name)**
Remove a property.

  This finds a property by name, and releases the internal resources which are associated with it.

- **Return**
  - ESP_OK : Success
  - ESP_ERR_NOT_FOUND : Failure

- **Parameters**
  - name: Name of the property to remove

**const esp_local_ctrl_prop_t *esp_local_ctrl_get_property (const char *name)**
Get property description structure by name.

  This API may be used to get a property’s context structure `esp_local_ctrl_prop_t` when its name is known

- **Return**

### 2.4. Application Protocols
• Pointer to property
• NULL if not found

Parameters
• name: Name of the property to find

`esp_err_t esp_local_ctrl_set_handler(const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)`

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

**Note** In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the `protocomm_ble_config_t` structure set in `esp_local_ctrl_config_t`, and passed to `esp_local_ctrl_start()`.

Return
• ESP_OK : Success
• ESP_FAIL : Failure

Parameters
• ep_name: Name of the endpoint
• handler: Endpoint handler function
• user_ctx: User data

Unions

```c
union esp_local_ctrl_transport_config_t
```

`#include <esp_local_ctrl.h>` Transport mode (BLE / HTTPD) configuration.

Public Members

```c
esp_local_ctrl_transport_config_ble_t *ble
```

This is same as `protocomm_ble_config_t`. See `protocomm_ble.h` for available configuration parameters.

```c
esp_local_ctrl_transport_config_httpd_t *httpd
```

This is same as `httpd_ssl_config_t`. See `esp_https_server.h` for available configuration parameters.

Structures

```c
struct esp_local_ctrl_prop
```

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.
Public Members

char *name
Unique name of property

uint32_t type
Type of property. This may be set to application defined enums

size_t size
Size of the property value, which:
  • if zero, the property can have values of variable size
  • if non-zero, the property can have values of fixed size only, therefore, checks are performed internally
    by esp_local_ctrl when setting the value of such a property

uint32_t flags
Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void *ctx
Pointer to some context data relevant for this property. This will be available for use inside the
get_prop_values and set_prop_values handlers as a part of this property structure. When set,
this is valid throughout the lifetime of a property, till either the property is removed or the esp_local_ctrl
service is stopped.

void (*ctx_free_fn)(void *ctx)
Function used by esp_local_ctrl to internally free the property context when
esp_local_ctrl_remove_property() or esp_local_ctrl_stop() is called.

struct esp_local_ctrl_prop_val
Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.

Public Members

void *data
Pointer to memory holding property value

size_t size
Size of property value

void (*free_fn)(void *data)
This may be set by the application in get_prop_values() handler to tell esp_local_ctrl to call
this function on the data pointer above, for freeing its resources after sending the get_prop_values
response.

struct esp_local_ctrl_handlers
Handlers for receiving and responding to local control commands for getting and setting properties.

Public Members

esp_err_t (*get_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[],
esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
Handler function to be implemented for retrieving current values of properties.

Note If any of the properties have fixed sizes, the size field of corresponding element in prop_values
need to be set
**Return** Returning different error codes will convey the corresponding protocol level errors to the client:

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

**Parameters**

- `props_count`: Total elements in the props array
- `props`: Array of properties, the current values for which have been requested by the client
- `prop_values`: Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument
- `usr_ctx`: This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

```c
esp_err_t (*set_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[], const esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
```

Handler function to be implemented for changing values of properties.

**Note** If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

**Return** Returning different error codes will convey the corresponding protocol level errors to the client:

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

**Parameters**

- `props_count`: Total elements in the props array
- `props`: Array of properties, the values for which the client requests to change
- `prop_values`: Array of property values, the elements of which need to be used for updating those properties specified by props argument
- `usr_ctx`: This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

```c
void *usr_ctx
```

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

```c
void (*usr_ctx_free_fn)(void *usr_ctx)
```

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

**struct esp_local_ctrl_config**

Configuration structure to pass to `esp_local_ctrl_start()`
Public Members

```c
const esp_local_ctrl_transport_t *transport
   Transport layer over which service will be provided
```

```c
esp_local_ctrl_transport_config_t *transport_config
   Transport layer over which service will be provided
```

```c
esp_local_ctrl_handlers_t *handlers
   Register handlers for responding to get/set requests on properties
```

```c
size_t max_properties
   This limits the number of properties that are available at a time
```

Macros

```c
ESP_LOCAL_CTRL_TRANSPORT_BLE
```

```c
ESP_LOCAL_CTRL_TRANSPORT_HTTPD
```

Type Definitions

```c
typedef struct esp_local_ctrl_prop esp_local_ctrl_prop_t
   Property description data structure, which is to be populated and passed to the esp_local_ctrl_add_property() function.
```

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

```c
typedef struct esp_local_ctrl_prop_val esp_local_ctrl_prop_val_t
   Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.
```

```c
typedef struct esp_local_ctrl_handlers esp_local_ctrl_handlers_t
   Handlers for receiving and responding to local control commands for getting and setting properties.
```

```c
typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t
   Transport mode (BLE / HTTPD) over which the service will be provided.
```

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

```c
typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t
   Configuration for transport mode BLE.
```

This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set `CONFIG_BT_BLUEDROID_ENABLED` and include `protocomm_ble.h`.

```c
typedef struct httpd_ssl_config esp_local_ctrl_transport_config_httpd_t
   Configuration for transport mode HTTPD.
```

This is a forward declaration for `httpd_ssl_config_t`. To use this, application must set `CONFIG_ESP_HTTPS_SERVER_ENABLE` and include `esp_https_server.h`.

```c
typedef struct esp_local_ctrl_config esp_local_ctrl_config_t
   Configuration structure to pass to `esp_local_ctrl_start()`
```

2.4. Application Protocols
2.4.9 mDNS Service

Overview

mDNS is a multicast UDP service that is used to provide local network service and host discovery.
mDNS is installed by default on most operating systems or is available as separate package. On Mac OS it is installed by default and is called Bonjour. Apple releases an installer for Windows that can be found on Apple’s support page. On Linux, mDNS is provided by avahi and is usually installed by default.

mDNS Properties

- **hostname**: the hostname that the device will respond to. If not set, the hostname will be read from the interface. Example: my-esp32 will resolve to my-esp32.local
- **default_instance**: friendly name for your device, like Jhon’s ESP32 Thing. If not set, hostname will be used.

Example method to start mDNS for the STA interface and set hostname and default_instance:

```c
void start_mdns_service()
{
    //initialize mDNS service
    esp_err_t err = mdns_init();
    if (err) {
        printf("MDNS Init failed: %d\n", err);
        return;
    }

    //set hostname
    mdns_hostname_set("my-esp32");
    //set default instance
    mdns_instance_name_set("Jhon’s ESP32 Thing");
}
```

mDNS Services

mDNS can advertise information about network services that your device offers. Each service is defined by a few properties.

- **instance_name**: friendly name for your service, like Jhon’s ESP32 Web Server. If not defined, default_instance will be used.
- **service_type**: (required) service type, prepended with underscore. Some common types can be found [here](#).
- **proto**: (required) protocol that the service runs on, prepended with underscore. Example: _tcp or _udp
- **port**: (required) network port that the service runs on
- **txt**: {var, val} array of strings, used to define properties for your service

Example method to add a few services and different properties:
```c
void add_mdns_services()
{
    //add our services
    mdns_service_add(NULL, "_http", "_tcp", 80, NULL, 0);
    mdns_service_add(NULL, "_arduino", "_tcp", 3232, NULL, 0);
    mdns_service_add(NULL, "_myservice", "_udp", 1234, NULL, 0);

    //NOTE: services must be added before their properties can be set
    //use custom instance for the web server
    mdns_service_instance_name_set("_http", "_tcp", "Jhon's ESP32 Web Server");

    mdns_txt_item_t serviceTxtData[3] = {
        {"board","esp32"},
        {"u","user"},
        {"p","password"}
    };
    //set txt data for service (will free and replace current data)
    mdns_service_txt_set("_http", "_tcp", serviceTxtData, 3);

    //change service port
    mdns_service_port_set("_myservice", "_udp", 4321);
}
```

**mDNS Query**

mDNS provides methods for browsing for services and resolving host’s IP/IPv6 addresses.

Results for services are returned as a linked list of `mdns_result_t` objects.

Example method to resolve host IPs:

```c
void resolve_mdns_host(const char * host_name)
{
    printf("Query A: %s.local", host_name);

    struct ip4_addr addr;
    addr.addr = 0;

    esp_err_t err = mdns_query_a(host_name, 2000, &addr);
    if(err){
        if(err == ESP_ERR_NOT_FOUND){
            printf("Host was not found!");
            return;
        }
        printf("Query Failed");
        return;
    }

    printf(IPSTR, IP2STR(&addr));
}
```

Example method to resolve local services:

```c
static const char * if_str[] = {"STA", "AP", "ETH", "MAX"};
static const char * ip_protocol_str[] = {"V4", "V6", "MAX"};
```

(continues on next page)
void mdns_print_results(mdns_result_t * results) {
    mdns_result_t * r = results;
    mdns_ip_addr_t * a = NULL;
    int i = 1, t;
    while (r) {
        printf("%d: Interface: %s, Type: %s\n", i++, if_str[r->tcpip_if],
               ip_protocol_str[r->ip_protocol]);
        if (r->instance_name) {
            printf(" PTR : %s\n", r->instance_name);
        }
        if (r->hostname) {
            printf(" SRV : %s.%s\n", r->hostname, r->port);
        }
        if (r->txt_count) {
            printf(" TXT : [%u] ", r->txt_count);
            for (t=0; t<r->txt_count; t++) {
                printf("%s=%s; ", r->txt[t].key, r->txt[t].value);
            }
            printf("\n");
        }
        a = r->addr;
        while (a) {
            if (a->addr.type == IPADDR_TYPE_V6) {
                printf(" AAAA: " IPV6STR "\n", IPV62STR((a->addr.u_addr.ip6));
            } else {
                printf(" A : " IPSTR "\n", IP2STR((a->addr.u_addr.ip4)));
            }
            a = a->next;
        }
    }
}

void find_mdns_service(const char * service_name, const char * proto) {
    ESP_LOGI(TAG, "Query PTR: %s.%s\n", service_name, proto);

    mdns_result_t * results = NULL;
    esp_err_t err = mdns_query_ptr(service_name, proto, 3000, 20, &results);
    if (err) {
        ESP_LOGE(TAG, "Query Failed");
        return;
    }
    if (!results) {
        ESP_LOGW(TAG, "No results found!");
        return;
    }
    mdns_print_results(results);
    mdns_query_results_free(results);
}

Example of using the methods above:

void my_app_some_method() {
    //search for esp32-mdns.local
}
resolve_mdns_host("esp32-mdns");

//search for HTTP servers
find_mdns_service("_http", "_tcp");
//or file servers
find_mdns_service("_smb", "_tcp"); //windows sharing
find_mdns_service("_afpovertcp", "_tcp"); //apple sharing
find_mdns_service("_nfs", "_tcp"); //NFS server
find_mdns_service("_ftp", "_tcp"); //FTP server
//or networked printer
find_mdns_service("_printer", "_tcp");
find_mdns_service("_ipp", "_tcp");
}

Application Example

mDNS server/scanner example: protocols/mdns.

API Reference

Header File

- mdns/include/mdns.h

Functions

`void mdns_free(void)`
Stop and free mDNS server.

`esp_err_t mdns_hostname_set(const char *hostname)`
Set the hostname for mDNS server required if you want to advertise services.

Parameters

- `hostname`: Hostname to set

2.4. Application Protocols
`esp_err_t mdns_instance_name_set(const char *instance_name)`
Set the default instance name for mDNS server.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

**Parameters**
- instance_name: Instance name to set

`esp_err_t mdns_service_add(const char *instance_name, const char *service_type, const char *proto, uint16_t port, mdns_txt_item_t txt[], size_t num_items)`
Add service to mDNS server.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error
- ESP_FAIL failed to add service

**Parameters**
- instance_name: instance name to set. If NULL, global instance name or hostname will be used
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- port: service port
- txt: string array of TXT data (eg. {{“var”,”val”},{“other”,”2”}})
- num_items: number of items in TXT data

`esp_err_t mdns_service_remove(const char *service_type, const char *proto)`
Remove service from mDNS server.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)

`esp_err_t mdns_service_instance_name_set(const char *service_type, const char *proto, const char *instance_name)`
Set instance name for service.
Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- instance_name: instance name to set

```c
esp_err_t mdns_service_port_set(const char *service_type, const char *proto, uint16_t port)
```
Set service port.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- port: service port

```c
esp_err_t mdns_service_txt_set(const char *service_type, const char *proto, mdns_txt_item_t txt[], uint8_t num_items)
```
Replace all TXT items for service.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- txt: array of TXT data (eg. {{“var”,”val”},{“other”,”2”}})
- num_items: number of items in TXT data

```c
esp_err_t mdns_service_txt_item_set(const char *service_type, const char *proto, const char *key, const char *value)
```
Set/Add TXT item for service TXT record.

2.4. Application Protocols
Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- service_type: service type (http, ftp, etc)
- proto: service protocol (tcp, udp)
- key: the key that you want to add/update
- value: the new value of the key

```c
esp_err_t mdns_service_txt_item_remove(const char *service_type, const char *proto, const char *key)
```

Remove TXT item for service TXT record.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- service_type: service type (http, ftp, etc)
- proto: service protocol (tcp, udp)
- key: the key that you want to remove

```c
esp_err_t mdns_service_remove_all()
```

Remove and free all services from mDNS server.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mdns_query(const char *name, const char *service_type, const char *proto, uint16_t type, uint32_t timeout, size_t max_results, mdns_result_t **results)
```

Query mDNS for host or service All following query methods are derived from this one.

Return

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG timeout was not given

Parameters
- name: service instance or host name (NULL for PTR queries)
- service_type: service type (_http, _arduino, _ftp etc.) (NULL for host queries)
- proto: service protocol (_tcp, _udp, etc.) (NULL for host queries)
- type: type of query (MDNS_TYPE_*)
- timeout: time in milliseconds to wait for answers.
- max_results: maximum results to be collected
- results: pointer to the results of the query results must be freed using mdns_query_results_free below

```c
void mdns_query_results_free (mdns_result_t *results)
```
Free query results.

**Parameters**
- results: linked list of results to be freed

```c
esp_err_t mdns_query_ptr (const char *service_type, const char *proto, uint32_t timeout, size_t max_results, mdns_result_t **results)
```
Query mDNS for service.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- service_type: service type (_http, _arduino, _ftp etc.)
- proto: service protocol (_tcp, _udp, etc.)
- timeout: time in milliseconds to wait for answer.
- max_results: maximum results to be collected
- results: pointer to the results of the query

```c
esp_err_t mdns_query_srv (const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, mdns_result_t **result)
```
Query mDNS for SRV record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- instance_name: service instance name
• service_type: service type (_http, _arduino, _ftp etc.)
• proto: service protocol (_tcp, _udp, etc.)
• timeout: time in milliseconds to wait for answer.
• result: pointer to the result of the query

`esp_err_t mdns_query_txt(const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, mdns_result_t **result)`

Query mDNS for TXT record.

Return

• ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG parameter error

Parameters

• instance_name: service instance name
• service_type: service type (_http, _arduino, _ftp etc.)
• proto: service protocol (_tcp, _udp, etc.)
• timeout: time in milliseconds to wait for answer.
• result: pointer to the result of the query

`esp_err_t mdns_query_a(const char *host_name, uint32_t timeout, esp_ip4_addr_t *addr)`

Query mDNS for A record.

Return

• ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG parameter error

Parameters

• host_name: host name to look for
• timeout: time in milliseconds to wait for answer.
• addr: pointer to the resulting IP4 address

`esp_err_t mdns_query_aaaa(const char *host_name, uint32_t timeout, esp_ip6_addr_t *addr)`

Query mDNS for A record.

Return

• ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG parameter error
Parameters

- `host_name`: host name to look for
- `timeout`: time in milliseconds to wait for answer. If 0, `max_results` needs to be defined
- `addr`: pointer to the resulting IP6 address

```c
esp_err_t mdns_handle_system_event(void *ctx, system_event_t *event)
```

System event handler This method controls the service state on all active interfaces and applications are required to call it from the system event handler for normal operation of mDNS service.

Parameters

- `ctx`: The system event context
- `event`: The system event

Structures

```c
struct mdns_txt_item_t
```

mDNS basic text item structure Used in `mdns_service_add()`

Public Members

- `const char *key`: item key name
- `const char *value`: item value string

```c
struct mdns_ip_addr_s
```

mDNS query linked list IP item

Public Members

- `esp_ip_addr_t addr`: IP address
- `struct mdns_ip_addr_s *next`: next IP, or NULL for the last IP in the list

```c
struct mdns_result_s
```

mDNS query result structure

Public Members

- `struct mdns_result_s *next`: next result, or NULL for the last result in the list

`mdns_if_t tcpip_if`

interface index

`mdns_ip_protocol_t ip_protocol`

ip_protocol type of the interface (v4/v6)
char *instance_name
    instance name

char *hostname
    hostname

uint16_t port
    service port

mdns_txt_item_t *txt
    txt record

size_t txt_count
    number of txt items

mdns_ip_addr_t *addr
    linked list of IP addresses found

Macros

MDNS_TYPE_A
MDNS_TYPE_PTR
MDNS_TYPE_TXT
MDNS_TYPE_AAAA
MDNS_TYPE_SRV
MDNS_TYPE_OPT
MDNS_TYPE_NSEC
MDNS_TYPE_ANY

Type Definitions

typedef struct mdns_ip_addr_s mdns_ip_addr_t
    mDNS query linked list IP item

typedef enum mdns_if_internal mdns_if_t

typedef struct mdns_result_s mdns_result_t
    mDNS query result structure

Enumerations

enum mdns_ip_protocol_t
    mDNS enum to specify the ip_protocol type

Values:

    MDNS_IP_PROTOCOL_V4
    MDNS_IP_PROTOCOL_V6
    MDNS_IP_PROTOCOL_MAX
enum mdns_if_internal
Values:
    MDNS_IF_STA = 0
    MDNS_IF_AP = 1
    MDNS_IF_ETH = 2
    MDNS_IF_MAX

2.4.10 ESP-Modbus

Overview

The Modbus serial communication protocol is de facto standard protocol widely used to connect industrial electronic devices. Modbus allows communication among many devices connected to the same network, for example, a system that measures temperature and humidity and communicates the results to a computer. The Modbus protocol uses several types of data: Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs. Versions of the Modbus protocol exist for serial port and for Ethernet and other protocols that support the Internet protocol suite. There are many variants of Modbus protocols, some of them are:

- **Modbus RTU** — This is used in serial communication and makes use of a compact, binary representation of the data for protocol communication. The RTU format follows the commands/data with a cyclic redundancy check checksum as an error check mechanism to ensure the reliability of data. Modbus RTU is the most common implementation available for Modbus. A Modbus RTU message must be transmitted continuously without inter-character hesitations. Modbus messages are framed (separated) by idle (silent) periods. The RS-485 interface communication is usually used for this type.

- **Modbus ASCII** — This is used in serial communication and makes use of ASCII characters for protocol communication. The ASCII format uses a longitudinal redundancy check checksum. Modbus ASCII messages are framed by leading colon (":") and trailing newline (CR/LF).

- **Modbus TCP/IP or Modbus TCP** — This is a Modbus variant used for communications over TCP/IP networks, connecting over port 502. It does not require a checksum calculation, as lower layers already provide checksum protection.

Modbus common interface API overview

The API functions below provide common functionality to setup Modbus stack for slave and master implementation accordingly. ISP-IDF supports Modbus serial slave and master protocol stacks and provides modbus_controller interface API to interact with user application.

```c
esp_err_t mbc_slave_init(mb_port_type_t port_type, void **handler)
```

Initialize Modbus controller and stack.

Return

- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error

Parameters

- `handler`: handler(pointer) to master data structure
- `port_type`: type of stack

2.4. Application Protocols
esp_err_t mbc_master_init (mb_port_type_t port_type, void **handler)
    Initialize Modbus controller and stack.

    Return
    • ESP_OK Success
    • ESP_ERR_NO_MEM Parameter error

    Parameters
    • handler: handler(pointer) to master data structure
    • port_type: the type of port

The function initializes the Modbus controller interface and its active context (tasks, RTOS objects and other resources).

esp_err_t mbc_slave_setup (void *comm_info)
    Set Modbus communication parameters for the controller.

    Return
    • ESP_OK Success
    • ESP_ERR_INVALID_ARG Incorrect parameter data

    Parameters
    • comm_info: Communication parameters structure.

esp_err_t mbc_master_setup (void *comm_info)
    Set Modbus communication parameters for the controller.

    Return
    • ESP_OK Success
    • ESP_ERR_INVALID_ARG Incorrect parameter data

    Parameters
    • comm_info: Communication parameters structure.

The function is used to setup communication parameters of the Modbus stack. See the Modbus controller API documentation for more information.

mbc_slave_set_descriptor(): Initialization of slave descriptor.
mbc_master_set_descriptor(): Initialization of master descriptor.

The Modbus stack uses parameter description tables (descriptors) for communication. These are different for master and slave implementation of stack and should be assigned by the API call before start of communication.

esp_err_t mbc_slave_start (void)
    Start Modbus communication stack.

    Return
    • ESP_OK Success
    • ESP_ERR_INVALID_ARG Modbus stack start error
esp_err_t mbc_master_start (void)
Start Modbus communication stack.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Modbus stack start error

Modbus controller start function. Starts stack and interface and allows communication.

esp_err_t mbc_slave_destroy (void)
Destroy Modbus controller and stack.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Parameter error

esp_err_t mbc_master_destroy (void)
Destroy Modbus controller and stack.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Parameter error

This function stops Modbus communication stack and destroys controller interface.

There are some configurable parameters of modbus_controller interface and Modbus stack that can be configured using KConfig values in “Modbus configuration” menu. The most important option in KConfig menu is “Selection of Modbus stack support mode” that allows to select master or slave stack for implementation. See the examples for more information about how to use these API functions.

Modbus serial slave interface API overview

The slave stack requires the user defined structures which represent Modbus parameters accessed by stack. These structures should be prepared by user and be assigned to the modbus_controller interface using mbc_slave_set_descriptor() API call before start of communication. The interface API functions below are used for Modbus slave application:

esp_err_t mbc_slave_set_descriptor (mb_register_area_descriptor_t descr_data)
Set Modbus area descriptor.

Return
• ESP_OK: The appropriate descriptor is set
• ESP_ERR_INVALID_ARG: The argument is incorrect

Parameters
• descr_data: Modbus registers area descriptor structure

The function initializes Modbus communication descriptors for each type of Modbus register area (Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs). Once areas are initialized and the mbc_slave_start()
API is called the Modbus stack can access the data in user data structures by request from master. See the mb_register_area_descriptor_t and example for more information.

`mb_event_group_t mbc_slave_check_event(mb_event_group_t group)`
Wait for specific event on parameter change.

**Return**
- `mb_event_group_t` event bits triggered

**Parameters**
- `group`: Group event bit mask to wait for change

The blocking call to function waits for event specified in the input parameter as event mask. Once master access the parameter and event mask matches the parameter the application task will be unblocked and function will return ESP_OK. See the mb_event_group_t for more information about Modbus event masks.

`esp_err_t mbc_slave_get_param_info(mb_param_info_t *reg_info, uint32_t timeout)`
Get parameter information.

**Return**
- ESP_OK Success
- ESP_ERR_TIMEOUT Can not get data from parameter queue or queue overflow

**Parameters**
- `reg_info`: parameter info structure
- `timeout`: Timeout in milliseconds to read information from parameter queue

The function gets information about accessed parameters from modbus controller event queue. The KConfig ‘CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE’ key can be used to configure the notification queue size. The timeout parameter allows to specify timeout for waiting notification. The mb_param_info_t structure contain information about accessed parameter.

### Modbus serial master interface API overview

The Modbus master implementation requires parameter description table be defined before start of stack. This table describes characteristics (physical parameters like temperature, humidity, etc.) and links them to Modbus registers in specific slave device in the Modbus segment. The table has to be assigned to the modbus_controller interface using mbc_master_set_descriptor() API call before start of communication.

Below are the interface API functions that are used to setup and use Modbus master stack from user application and can be executed in next order:

`esp_err_t mbc_master_set_descriptor(const mb_parameter_descriptor_t *descriptor, const uint16_t num_elements)`
Assign parameter description table for Modbus controller interface.

**Return**
- `esp_err_t` ESP_OK - set descriptor successfully
- `esp_err_t` ESP_ERR_INVALID_ARG - invalid argument in function call

**Parameters**
- `descriptor`: pointer to parameter description table
Assigns parameter description table for Modbus controller interface. The table has to be prepared by user according to particular

```c
esp_err_t mbc_master_send_request (mb_param_request_t *request, void *data_ptr)
```

Send data request as defined in parameter request, waits response from slave and returns status of command execution. This function provides standard way for read/write access to Modbus devices in the network.

**Return**

- esp_err_t ESP_OK - request was successful
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
- esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave
- esp_err_t ESP_ERR_TIMEOUT - operation timeout or no response from slave
- esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
- esp_err_t ESP_FAIL - slave returned an exception or other failure

**Parameters**

- `request`: pointer to request structure of type mb_param_request_t
- `data_ptr`: pointer to data buffer to send or received data (dependent of command field in request)

This function sends data request as defined in parameter request, waits response from corresponded slave and returns status of command execution. This function provides a standard way for read/write access to Modbus devices in the network.

```c
esp_err_t mbc_master_get_cid_info (uint16_t cid, const mb_parameter_descriptor_t **param_info)
```

Get information about supported characteristic defined as cid. Uses parameter description table to get this information. The function will check if characteristic defined as a cid parameter is supported and returns its description in param_info. Returns ESP_ERR_NOT_FOUND if characteristic is not supported.

**Return**

- esp_err_t ESP_OK - request was successful and buffer contains the supported characteristic name
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
- esp_err_t ESP_ERR_NOT_FOUND - the characteristic (cid) not found
- esp_err_t ESP_FAIL - unknown error during lookup table processing

**Parameters**

- `cid`: characteristic id
- `param_info`: pointer to pointer of characteristic data.

The function gets information about supported characteristic defined as cid. It will check if characteristic is supported and returns its description.

```c
esp_err_t mbc_master_get_parameter (uint16_t cid, char *name, uint8_t *value, uint8_t *type)
```

Read parameter from modbus slave device whose name is defined by name and has cid. The additional data for request is taken from parameter description (lookup) table.

**Return**
• esp_err_t ESP_OK - request was successful and value buffer contains representation of actual parameter data from slave
• esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
• esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave
• esp_err_t ESP_ERR_INVALID_STATE - invalid state during data processing or allocation failure
• esp_err_t ESP_ERR_TIMEOUT - operation timed out and no response from slave
• esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
• esp_err_t ESP_ERR_NOT_FOUND - the parameter is not found in the parameter description table
• esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters

• cid: id of the characteristic for parameter
• name: pointer into string name (key) of parameter (null terminated)
• value: pointer to data buffer of parameter
• type: parameter type associated with the name returned from parameter description table.

The function reads data of characteristic defined in parameters from Modbus slave device and returns its data. The additional data for request is taken from parameter description table.

```c
esp_err_t mbc_master_set_parameter(uint16_t cid, char *name, uint8_t *value, uint8_t *type)
```

Set characteristic’s value defined as a name and cid parameter. The additional data for cid parameter request is taken from master parameter lookup table.

Return

• esp_err_t ESP_OK - request was successful and value was saved in the slave device registers
• esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
• esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave during processing of parameter
• esp_err_t ESP_ERR_INVALID_STATE - invalid state during data processing or allocation failure
• esp_err_t ESP_ERR_TIMEOUT - operation timed out and no response from slave
• esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
• esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters

• cid: id of the characteristic for parameter
• name: pointer into string name (key) of parameter (null terminated)
• value: pointer to data buffer of parameter (actual representation of json value field in binary form)
• type: pointer to parameter type associated with the name returned from parameter lookup table.

The function writes characteristic’s value defined as a name and cid parameter in corresponded slave device. The additional data for parameter request is taken from master parameter description table.
Application Example

The examples below use the FreeModbus library port for serial slave and master implementation accordingly. The selection of stack is performed through KConfig menu “Selection of Modbus stack support mode” and related configuration keys.

protocols/modbus/serial/mb_slave
protocols/modbus/serial/mb_master

Please refer to the specific example README.md for details.

2.4.11 ESP WebSocket Client

Overview

The ESP WebSocket client is an implementation of WebSocket protocol client for ESP32

Features

- supports WebSocket over TCP, SSL with mbedtls
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)

Configuration

URI

- Supports ws, wss schemes
- WebSocket samples:
  - ws://websocket.org: WebSocket over TCP, default port 80
  - wss://websocket.org: WebSocket over SSL, default port 443
- Minimal configurations:

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org",
};
```

- If there are any options related to the URI in esp_websocket_client_config_t, the option defined by the URI will be overridden. Sample:

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org:123",
    .port = 4567,
};
//WebSocket client will connect to websocket.org using port 4567
```
SSL

- Get certificate from server, example:
  ```sh
  websocket.org openssl s_client -showcerts -connect websocket.org:443</dev/null 2>/dev/null|openssl x509 -outform PEM >websocket_org.pem
  ```
- Configuration:
  ```c
  const esp_websocket_client_config_t ws_cfg = {
    .uri = "wss://websocket.org",
    .cert_pem = (const char *)websocket_org_pem_start,
  };
  ```

For more options on `esp_websocket_client_config_t`, please refer to API reference below

**Application Example**

Simple WebSocket example that uses `esp_websocket_client` to establish a websocket connection and send/receive data with the `websocket.org` Server: `protocols/websocket`.

**API Reference**

**Header File**

- `esp_websocket_client/include/esp_websocket_client.h`

**Functions**

`esp_websocket_client_handle_t esp_websocket_client_init(const esp_websocket_client_config_t *config)`

Start a Websocket session This function must be the first function to call, and it returns a `esp_websocket_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_websocket_client_destroy` when the operation is complete.

**Return**

- `esp_websocket_client_handle_t`
- `NULL` if any errors

**Parameters**

- `config`: The configuration

`esp_err_t esp_websocket_client_set_uri(esp_websocket_client_handle_t client, const char *uri)`

Set URL for client, when performing this behavior, the options in the URL will replace the old ones Must stop the WebSocket client before set URI if the client has been connected.

**Return** `esp_err_t`

**Parameters**

- `client`: The client
- `uri`: The uri
**esp_err_t esp_websocket_client_start** *(esp_websocket_client_handle_t client)*  
Open the WebSocket connection.

**Return** esp_err_t  
**Parameters**  
• client: The client

**esp_err_t esp_websocket_client_stop** *(esp_websocket_client_handle_t client)*  
Close the WebSocket connection.

**Return** esp_err_t  
**Parameters**  
• client: The client

**esp_err_t esp_websocket_client_destroy** *(esp_websocket_client_handle_t client)*  
Destroy the WebSocket connection and free all resources. This function must be the last function to call for an session. It is the opposite of the esp_websocket_client_init function and must be called with the same handle as input that a esp_websocket_client_init call returned. This might close all connections this handle has used.

**Return** esp_err_t  
**Parameters**  
• client: The client

**int esp_websocket_client_send** *(esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)*  
Generic write data to the WebSocket connection; defaults to binary send.

**Return**  
• Number of data was sent  
• (-1) if any errors  
**Parameters**  
• client: The client  
• data: The data  
• len: The length  
• timeout: Write data timeout in RTOS ticks

**int esp_websocket_client_send_bin** *(esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)*  
Write binary data to the WebSocket connection (data send with WS OPCODE=02, i.e. binary)

**Return**  
• Number of data was sent  
• (-1) if any errors  
**Parameters**  
• client: The client

2.4. Application Protocols
• \textbf{data}: The data
• \textbf{len}: The length
• \textbf{timeout}: Write data timeout in RTOS ticks

\textbf{int \texttt{esp_websocket_client_send_text} (\texttt{esp_websocket_client_handle_t client, \texttt{const char *data, int len, TickType_t timeout})}

Write textual data to the WebSocket connection (data send with WS OPCODE=01, i.e. text)

\textbf{Return}
• Number of data was sent
• (-1) if any errors

\textbf{Parameters}
• \textbf{client}: The client
• \textbf{data}: The data
• \textbf{len}: The length
• \textbf{timeout}: Write data timeout in RTOS ticks

\textbf{bool \texttt{esp_websocket_client_is_connected} (\texttt{esp_websocket_client_handle_t client})}

Check the WebSocket connection status.

\textbf{Return}
• \textbf{true}
• \textbf{false}

\textbf{Parameters}
• \textbf{client}: The client handle

\textbf{esp_err_t \texttt{esp_websocket_register_events} (\texttt{esp_websocket_client_handle_t client, esp_websocket_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg})}

Register the Websocket Events.

\textbf{Return} \textbf{esp_err_t}

\textbf{Parameters}
• \textbf{client}: The client handle
• \textbf{event}: The event id
• \textbf{event_handler}: The callback function
• \textbf{event_handler_arg}: User context

\textbf{Structures}

\textbf{struct \texttt{esp_websocket_event_data_t}}

Websocket event data.
Public Members

`const char *data_ptr`  
Data pointer

`int data_len`  
Data length

`uint8_t op_code`  
Received opcode

`esp_websocket_client_handle_t client`  
`esp_websocket_client_handle_t context`

`void *user_context`  
user_data context, from `esp_websocket_client_config_t user_data`

`int payload_len`  
Total payload length, payloads exceeding buffer will be posted through multiple events

`int payload_offset`  
Actual offset for the data associated with this event

`struct esp_websocket_client_config_t`  
Websocket client setup configuration.

Public Members

`const char *uri`  
Websocket URI, the information on the URI can be overrides the other fields below, if any

`const char *host`  
Domain or IP as string

`int port`  
Port to connect, default depend on `esp_websocket_transport_t` (80 or 443)

`const char *username`  
Using for Http authentication - Not supported for now

`const char *password`  
Using for Http authentication - Not supported for now

`const char *path`  
HTTP Path, if not set, default is `/`

`bool disable_auto_reconnect`  
Disable the automatic reconnect function when disconnected

`void *user_context`  
HTTP user data context

`int task_prio`  
Websocket task priority

`int task_stack`  
Websocket task stack

`int buffer_size`  
Websocket buffer size
const char *cert_pem
    SSL Certification, PEM format as string, if the client requires to verify server

esp_websocket_transport_t transport
    Websocket transport type, see `esp_websocket_transport_t`

char *subprotocol
    Websocket subprotocol

char *user_agent
    Websocket user-agent

char *headers
    Websocket additional headers

Type Definitions

typedef struct esp_websocket_client *esp_websocket_client_handle_t

Enumerations

enum esp_websocket_event_id_t
    Websocket Client events id.
    
    Values:
    
    WEBSOCKET_EVENT_ANY = -1
    WEBSOCKET_EVENT_ERROR = 0
        This event occurs when there are any errors during execution
    WEBSOCKET_EVENT_CONNECTED
        Once the Websocket has been connected to the server, no data exchange has been performed
    WEBSOCKET_EVENT_DISCONNECTED
        The connection has been disconnected
    WEBSOCKET_EVENT_DATA
        When receiving data from the server, possibly multiple portions of the packet
    WEBSOCKET_EVENT_MAX

enum esp_websocket_transport_t
    Websocket Client transport.
    
    Values:
    
    WEBSOCKET_TRANSPORT_UNKNOWN = 0x0
        Transport unknown
    WEBSOCKET_TRANSPORT_OVER_TCP
        Transport over tcp
    WEBSOCKET_TRANSPORT_OVER_SSL
        Transport over ssl
2.4.12 ESP Serial Slave Link

Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The `esp_serial_slave_link` component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an `esp_serial_slave_link` device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

For more details about ESP32 SDIO slave protocol, see document *Communication with ESP SDIO Slave*.

Terminology

- **ESSL**: Abbreviation for ESP Serial Slave Link, the component described by this document.
- **Master**: The device running the `esp_serial_slave_link` component.
- **ESSL device**: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- **ESSL device handle**: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.

  The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- **ESP slave**: the slave device connected to the bus, which ESSL component is designed to communicate with.
- **Bus**: The bus over which the master and the slave communicate with each other.
- **Slave protocol**: The special communication protocol specified by Espressif HW/SW over the bus.
- **TX buffer num**: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- **RX data size**: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. **Tohost Interrupts**: The slave can inform the master about certain events by the interrupt line.
2. **Frhost Interrupts**: The master can inform the slave about certain events.
3. **Tx FIFO (master to slave)**: the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.

   The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. **Rx FIFO (slave to master)**: the slave can receive data from the master in units of receiving buffers.

   The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

**Initialization of ESP SDIO Slave Link**

The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see :doc:`Document of SDMMC driver </api-reference/storage/sdmmc>` structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

**APIs**

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

**Interrupts**

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.
5. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

**TX FIFO**

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_paket()` to send data to the slave.

**RX FIFO**

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.
Reset counters (Optional)

Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

Application Example

The example below shows how ESP32 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

Please refer to the specific example README.md for details.

API Reference

Header File

- `esp_serial_slave_link/include/esp_serial_slave_link/essl.h`

Functions

```c
esp_err_t essl_init (essl_handle_t handle, uint32_t wait_ms)
```

Initialize the slave.

**Return** ESP_OK if success, or other value returned from lower layer `init`.

**Parameters**

- `handle`: Handle of a `essl` device.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_wait_for_ready (essl_handle_t handle, uint32_t wait_ms)
```

Wait for interrupt of a ESP32 slave device.

**Return**

- ESP_OK if success
- One of the error codes from SDMMC host controller

**Parameters**

- `handle`: Handle of a `essl` device.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_get_tx_buffer_num (essl_handle_t handle, uint32_t *out_tx_num, uint32_t wait_ms)
```

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

**Return**

- ESP_OK Success
- One of the error codes from SDMMC host controller

**Parameters**

2.4. Application Protocols
• **handle**: Handle of a essl device.
• **out_tx_num**: Output of buffer num that host can send data to ESP32 slave.
• **wait_ms**: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t essl_get_rx_data_size (essl_handle_t handle, uint32_t *out_rx_size, uint32_t wait_ms)**

Get amount of data the ESP32 slave preparing to send to host.

**Return**

• ESP_OK Success
• One of the error codes from SDMMC host controller

**Parameters**

• **handle**: Handle of a essl device.
• **out_rx_size**: Output of data size to read from slave.
• **wait_ms**: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t essl_reset_cnt (essl_handle_t handle)**

Reset the counters of this component. Usually you don’t need to do this unless you know the slave is reset.

**Parameters**

• **handle**: Handle of a essl device.

**esp_err_t essl_send_packet (essl_handle_t handle, const void *start, size_t length, uint32_t wait_ms)**

Send a packet to the ESP32 slave. The slave receive the packet into buffers whose size is `buffer_size` (configured during initialization).

**Return**

• ESP_OK Success
• ESP_ERR_TIMEOUT No buffer to use, or error from SDMMC host controller
• One of the error codes from SDMMC host controller

**Parameters**

• **handle**: Handle of a essl device.
• **start**: Start address of the packet to send
• **length**: Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
• **wait_ms**: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t essl_get_packet (essl_handle_t handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)**

Get a packet from ESP32 slave.

**Return**

• ESP_OK Success, all the data are read from the slave.
• ESP_ERR_NOT_FINISHED Read success, while there’re data remaining.
• One of the error codes from SDMMC host controller
Parameters

• handle: Handle of a essl device.
• out_data: Data output address
• size: The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns ESP_ERR_NOT_FINISHED
• out_length: Output of length the data actually received from slave.
• wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

\texttt{esp_err_t essl_write_reg (essl_handle_t handle, uint8_t addr, uint8_t value, uint8_t *value_o, uint32_t wait_ms)}

Write general purpose R/W registers (8-bit) of ESP32 slave.

\textbf{Note} sdio 28-31 are reserved, the lower API helps to skip.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Address not valid.
• One of the error codes from SDMMC host controller

Parameters

• handle: Handle of a essl device.
• addr: Address of register to write. Valid address: 0-59.
• value: Value to write to the register.
• value_o: Output of the returned written value.
• wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

\texttt{esp_err_t essl_read_reg (essl_handle_t handle, uint8_t add, uint8_t *value_o, uint32_t wait_ms)}

Read general purpose R/W registers (8-bit) of ESP32 slave.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Address not valid.
• One of the error codes from SDMMC host controller

Parameters

• handle: Handle of a essl device.
• add: Address of register to read. Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read).
• value_o: Output value read from the register.
• wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

\texttt{esp_err_t essl_wait_int (essl_handle_t handle, uint32_t wait_ms)}

wait for an interrupt of the slave

Return
• ESP_ERR_NOT_SUPPORTED Currently our driver does not support SDIO with SPI interface.
• ESP_OK If interrupt triggered.
• ESP_ERR_TIMEOUT No interrupts before timeout.

**Parameters**

- **handle:** Handle of a essl device.
- **wait_ms:** Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
int32_t essl_clear_intr(essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```

Clear interrupt bits of ESP32 slave. All the bits set in the mask will be cleared, while other bits will stay the same.

**Return**

- ESP_OK Success
- One of the error codes from SDMMC host controller

**Parameters**

- **handle:** Handle of a essl device.
- **intr_mask:** Mask of interrupt bits to clear.
- **wait_ms:** Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
int32_t essl_get_intr(essl_handle_t handle, uint32_t *intr_raw, uint32_t *intr_st, uint32_t wait_ms)
```

Get interrupt bits of ESP32 slave.

**Return**

- ESP_OK Success
- ESP_INVALID_ARG if both intr_raw and intr_st are NULL.
- One of the error codes from SDMMC host controller

**Parameters**

- **handle:** Handle of a essl device.
- **intr_raw:** Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- **intr_st:** Output of the masked interrupt bits. Set to NULL if only raw bits are read.
- **wait_ms:** Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
int32_t essl_set_intr_ena(essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)
```

Set interrupt enable bits of ESP32 slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

**Return**

- ESP_OK Success
- One of the error codes from SDMMC host controller

**Parameters**

- **handle:** Handle of a essl device.
- **ena_mask:** Mask of the interrupt bits to enable.
• wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_get_intr_ena (essl_handle_t handle, uint32_t *ena_mask_o, uint32_t wait_ms)
```
Get interrupt enable bits of ESP32 slave.

Return
- ESP_OK Success
- One of the error codes from SDMMC host controller

Parameters
- handle: Handle of an essl device.
- ena_mask_o: Output of interrupt bit enable mask.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_send_slave_intr (essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```
Send interrupts to slave. Each bit of the interrupt will be triggered.

Return
- ESP_OK Success
- One of the error codes from SDMMC host controller

Parameters
- handle: Handle of an essl device.
- intr_mask: Mask of interrupt bits to send to slave.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

Macros

```c
ESP_ERR_NOT_FINISHED
```
There is still remaining data.

Type Definitions

```c
typedef struct essl_dev_t *essl_handle_t
```
Handle of an ESSL device.

Header File

- esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h

Functions

```c
esp_err_t essl_sdio_init_dev (essl_handle_t *out_handle, const essl_sdio_config_t *config)
```
Initialize the ESSL SDIO device and get its handle.

Return
• ESP_OK: on success
• ESP_ERR_NO_MEM: memory exhausted.

Parameters
• out_handle: Output of the handle.
• config: Configuration for the ESSL SDIO device.

\texttt{esp_err_t} essl_{sdio} \_deinit_{dev}(\texttt{essl}\_handle\_t handle)

Deinitialize and free the space used by the ESSL SDIO device.

Return
• ESP_OK: on success
• ESP_ERR_INVALID_ARG: wrong handle passed

Parameters
• handle: Handle of the ESSL SDIO device to deinit.

Structures

\texttt{struct essl\_sdio\_config\_t}

Configuration for the essl SDIO device.

Public Members

\texttt{sdmmc\_card\_t} *\texttt{card}

The initialized sdmmc card pointer of the slave.

\texttt{int} recv_buffer_size

The pre-negotiated recv buffer size used by both the host and the slave.

Code examples for this API section are provided in the protocols directory of ESP-IDF examples.

2.4.13 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in Networking APIs.

2.5 Provisioning API

[]

2.5.1 Protocol Communication

Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.
Following features are available for provisioning:

- Communication security at application level -
  - protocomm_security0 (no security)
  - protocomm_security1 (curve25519 key exchange + AES-CTR encryption)
- Proof-of-possession (support with protocomm_security1 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Though users can implement their own security (even without using protobuf). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).

Note that the client still needs to establish session (only for protocomm_security1) by performing the two way handshake. See *Unified Provisioning* for more details about the secure handshake logic.

### Transport Example (SoftAP + HTTP) with Security 1

For complete example see provisioning/softap_prov

```c
/* Endpoint handler to be registered with protocomm.
* This simply echoes back the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
   const uint8_t *inbuf, ssize_t inlen,
   uint8_t **outbuf, ssize_t *outlen,
   void *priv_data)
{
    /* Session ID may be used for persistence */
    printf("Session ID : %d", session_id);

    /* Echo back the received data */
    *outlen = inlen; /* Output data length updated */
    *outbuf = malloc(inlen); /* This will be deallocated outside */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;
}

/* Example function for launching a protocomm instance over HTTP */
protocomm_t *start_pc(const char *pop_string)
{
    protocomm_t *pc = protocomm_new();

    /* Config for protocomm_httpd_start() */
    protocomm_httpd_config_t pc_config = {
        .data = {
            .config = PROTOCOMM_HTTPD_DEFAULT_CONFIG()
        }
    };
}
```

(continues on next page)
/* Start protocomm server on top of HTTP */
protocomm_httpd_start(pc, &pc_config);

/* Create Proof of Possession object from pop_string. It must be valid */
/* throughout the scope of protocomm endpoint. This need not be static, */
/* i.e. could be dynamically allocated and freed at the time of endpoint */
/* removal */
const static protocomm_security_pop_t pop_obj = {
    .data = (const uint8_t *) strdup(pop_string),
    .len = strlen(pop_string)
};

/* Set security for communication at application level. Just like for */
/* request handlers, setting security creates an endpoint and registers */
/* the handler provided by protocomm_security1. One can similarly use */
/* protocomm_security0. Only one type of security can be set for a */
/* protocomm instance at a time. */
protocomm_set_security(pc, "security_endpoint", &protocomm_security1, &
    pop_obj);

/* Private data passed to the endpoint must be valid throughout the scope */
/* of protocomm endpoint. This need not be static, i.e. could be */
/* dynamically */
static uint32_t priv_data = 1234;

/* Add a new endpoint for the protocomm instance, identified by a unique */
/* name */
/* and register a handler function along with private data to be passed */
/* at the */
/* time of handler execution. Multiple endpoints can be added as long as */
/* they */
/* are identified by unique names */
protocomm_add_endpoint(pc, "echo_req_endpoint",
    echo_req_handler, (void *) &priv_data);

return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    /* Remove endpoint identified by it's unique name */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* Remove security endpoint identified by it's name */
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop HTTP server */
    protocomm_httpd_stop(pc);

    /* Delete (deallocate) the protocomm instance */
    protocomm_delete(pc);
}
Transport Example (BLE) with Security 0

For complete example see `provisioning/ble_prov`

```c
/* Example function for launching a secure protocomm instance over BLE */
protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();

    /* Endpoint UUIDs */
    protocomm_ble_name_uuid_t nu_lookup_table[] = {
        "security_endpoint", 0xFF51,
        "echo_req_endpoint", 0xFF52
    };

    /* Config for protocomm_ble_start() */
    protocomm_ble_config_t config = {
        .service_uuid = {
            /* LSB <---------------------------------------
             * ---------------------------------------> MSB */
            0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x00, 0x80,
            0x00, 0x10, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
        },
        .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_table[0]),
        .nu_lookup = nu_lookup_table
    };

    /* Start protocomm layer on top of BLE */
    protocomm_ble_start(pc, &config);

    /* For protocomm_security0, Proof of Possession is not used, and can be kept NULL */
    protocomm_set_security(pc, "security_endpoint", NULL);
    protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler, NULL);
    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop BLE protocomm service */
    protocomm_ble_stop(pc);

    protocomm_delete(pc);
}
```

API Reference

Header File

- protocomm/include/common/protocomm.h

2.5. Provisioning API
Functions

protocomm_t *protocomm_new (void)
Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the protocomm_t structure initialized to NULL.

Return

• protocomm_t* : On success
• NULL : No memory for allocating new instance

void protocomm_delete (protocomm_t *pc)
Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using protocomm_new().

Parameters

• pc: Pointer to the protocomm instance to be deleted

esp_err_t protocomm_add_endpoint (protocomm_t *pc, const char *ep_name, protocomm_req_handler_t h, void *priv_data)
Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

Note

• An endpoint must be bound to a valid protocomm instance, created using protocomm_new().
• This function internally calls the registered add_endpoint() function of the selected transport which is a member of the protocomm_t instance structure.

Return

• ESP_OK : Success
• ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
• ESP_ERR_NO_MEM : Error allocating endpoint resource
• ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

Parameters

• pc: Pointer to the protocomm instance
• ep_name: Endpoint identifier(name) string
• h: Endpoint handler function
• priv_data: Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

esp_err_t protocomm_remove_endpoint (protocomm_t *pc, const char *ep_name)
Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.
Note
• This function internally calls the registered `remove_endpoint()` function which is a member of
  the `protocomm_t` instance structure.

Return
• ESP_OK : Success
• ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
• ESP_ERR_INVALID_ARG : Null instance/name arguments

Parameters
• `pc`: Pointer to the `protocomm` instance
• `ep_name`: Endpoint identifier(name) string

`esp_err_t protocomm_open_session(protocomm_t *pc, uint32_t session_id)`
Allocates internal resources for new transport session.

Note
• An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.

Return
• ESP_OK : Request handled successfully
• ESP_ERR_NO_MEM : Error allocating internal resource
• ESP_ERR_INVALID_ARG : Null instance/name arguments

Parameters
• `pc`: Pointer to the `protocomm` instance
• `session_id`: Unique ID for a communication session

`esp_err_t protocomm_close_session(protocomm_t *pc, uint32_t session_id)`
Frees internal resources used by a transport session.

Note
• An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.

Return
• ESP_OK : Request handled successfully
• ESP_ERR_INVALID_ARG : Null instance/name arguments

Parameters
• `pc`: Pointer to the `protocomm` instance
• `session_id`: Unique ID for a communication session

`esp_err_t protocomm_req_handle(protocomm_t *pc, const char *ep_name, uint32_t session_id,
  const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)`
Calls the registered handler of an endpoint session for processing incoming data and generating the response.

Note
• An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
• Resulting output buffer must be deallocated by the caller.

**Return**
- ESP_OK : Request handled successfully
- ESP_FAIL : Internal error in execution of registered handler
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

**Parameters**
- `pc` : Pointer to the protocomm instance
- `ep_name` : Endpoint identifier(name) string
- `session_id` : Unique ID for a communication session
- `inbuf` : Input buffer contains input request data which is to be processed by the registered handler
- `inlen` : Length of the input buffer
- `outbuf` : Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- `outlen` : Buffer length of the allocated output buffer

```c
esp_err_t protocomm_set_security(protocomm_t *pc, const char *ep_name, const protocomm_security_t *sec, const protocomm_security_pop_t *pop)
```

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` are readily available.

**Return**
- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE : Security endpoint already set
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

**Parameters**
- `pc` : Pointer to the protocomm instance
- `ep_name` : Endpoint identifier(name) string
- `sec` : Pointer to endpoint security instance
- `pop` : Pointer to proof of possession for authenticating a client
esp_err_t protocomm_unset_security (protocomm_t *pc, const char *ep_name)
Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

Return

• ESP_OK : Success
• ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
• ESP_ERR_INVALID_ARG : Null instance/name arguments

Parameters

• pc: Pointer to the protocomm instance
• ep_name: Endpoint identifier(name) string

esp_err_t protocomm_set_version (protocomm_t *pc, const char *ep_name, const char *version)
Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

Note

• An endpoint must be bound to a valid protocomm instance, created using protocomm_new().

Return

• ESP_OK : Success
• ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
• ESP_ERR_INVALID_STATE : Version endpoint already set
• ESP_ERR_NO_MEM : Error allocating endpoint resource
• ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

Parameters

• pc: Pointer to the protocomm instance
• ep_name: Endpoint identifier(name) string
• version: Version identifier(name) string

esp_err_t protocomm_unset_version (protocomm_t *pc, const char *ep_name)
Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

Return

• ESP_OK : Success
• ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
• ESP_ERR_INVALID_ARG : Null instance/name arguments

Parameters

• pc: Pointer to the protocomm instance
• ep_name: Endpoint identifier(name) string

2.5. Provisioning API
Type Definitions

typedef esp_err_t (*protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Function prototype for protocomm endpoint handler.

typedef struct protocomm protocomm_t

This structure corresponds to a unique instance of protocomm returned when the API protocomm_new() is called. The remaining Protocomm APIs require this object as the first parameter.

Note Structure of the protocomm object is kept private

Header File

- protocomm/include/security/protocomm_security.h

Structures

struct protocomm_security_pop
Proof Of Possession for authenticating a secure session.

Public Members

const uint8_t *data
Pointer to buffer containing the proof of possession data

uint16_t len
Length (in bytes) of the proof of possession data

struct protocomm_security
Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

Note This structure should not have any dynamic members to allow re-entrancy

Public Members

int ver
Unique version number of security implementation

esp_err_t (*init)(protocomm_security_handle_t *handle)
Function for initializing/allocating security infrastructure

esp_err_t (*cleanup)(protocomm_security_handle_t handle)
Function for deallocating security infrastructure

esp_err_t (*new_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
Starts new secure transport session with specified ID

esp_err_t (*close_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
Closes a secure transport session with specified ID
Handler function for authenticating connection request and establishing secure session

Function which implements the encryption algorithm

Function which implements the decryption algorithm

Type Definitions

typedef struct protocomm_security_pop protocomm_security_pop_t
Proof Of Possession for authenticating a secure session.

typedef void *protocomm_security_handle_t

typedef struct protocomm_security protocomm_security_t
Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

Note This structure should not have any dynamic members to allow re-entrancy

Header File

- protocomm/include/security/protocomm_security0.h

Header File

- protocomm/include/security/protocomm_security1.h

Header File

- protocomm/include/transports/protocomm_httpd.h

Functions

esp_err_t protocomm_httpd_start (protocomm_t *pc, const protocomm_httpd_config_t *config)
Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

Note This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

Return

- ESP_OK : Success
Read the Docs Template Documentation, Release v4.1

- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_NOT_SUPPORTED: Transport layer bound to another protocomm instance
- ESP_ERR_INVALID_STATE: Transport layer already bound to this protocomm instance
- ESP_ERR_NO_MEM: Memory allocation for server resource failed
- ESP_ERR_HTTPD_*: HTTP server error on start

### Parameters
- `pc`: Protocomm instance pointer obtained from protocomm_new()
- `config`: Pointer to config structure for initializing HTTP server

```c
esp_err_t protocomm_httpd_stop(protocomm_t *pc)
```

Stop HTTPD protocomm transport.
This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

### Return
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Null / incorrect protocomm instance pointer

### Parameters
- `pc`: Same protocomm instance that was passed to protocomm_httpd_start()

### Unions

```c
union protocomm_httpd_config_data_t
```

**include <protocomm_httpd.h>** Protocomm HTTPD Configuration Data

### Public Members

- **void** `handle`
  HTTP Server Handle, if ext_handle_provided is set to true

```c
protocomm_http_server_config_t config
```

HTTP Server Configuration, if a server is not already active

### Structures

```c
struct protocomm_http_server_config_t
```

Config parameters for protocomm HTTP server.

### Public Members

- **uint16_t** `port`
  Port on which the HTTP server will listen

- **size_t** `stack_size`
  Stack size of server task, adjusted depending upon stack usage of endpoint handler
unsigned \textbf{task\_priority}
\begin{itemize}
\item Priority of server task
\end{itemize}

\textbf{struct protocomm\_httpd\_config\_t}
\begin{itemize}
\item Config parameters for protocomm HTTP server.
\end{itemize}

\textbf{Public Members}

\begin{itemize}
\item \textbf{bool ext\_handle\_provided}
\item Flag to indicate of an external HTTP Server Handle has been provided. In such a case, protocomm will use the same HTTP Server and not start a new one internally.
\item \textbf{protocomm\_httpd\_config\_data\_t data}
\item Protocomm HTTPD Configuration Data
\end{itemize}

\textbf{Macros}

\begin{itemize}
\item \textbf{PROTOCOMM\_HTTPD\_DEFAULT\_CONFIG()}
\end{itemize}

\textbf{Header File}

\begin{itemize}
\item protocomm/include/transports/protocomm\_ble\_h
\end{itemize}

\textbf{Functions}

\begin{itemize}
\item \textbf{esp\_err\_t protocomm\_ble\_start (protocomm\_t *pc, const protocomm\_ble\_config\_t *config)}
\item Start Bluetooth Low Energy based transport layer for provisioning.
\item Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.
\item \textbf{Return}
\begin{itemize}
\item ESP\_OK : Success
\item ESP\_FAIL : Simple BLE start error
\item ESP\_ERR\_NO\_MEM : Error allocating memory for internal resources
\item ESP\_ERR\_INVALID\_STATE : Error in ble config
\item ESP\_ERR\_INVALID\_ARG : Null arguments
\end{itemize}
\item \textbf{Parameters}
\begin{itemize}
\item \textbf{pc}: Protocomm instance pointer obtained from protocomm\_new()
\item \textbf{config}: Pointer to config structure for initializing BLE
\end{itemize}
\end{itemize}

\begin{itemize}
\item \textbf{esp\_err\_t protocomm\_ble\_stop (protocomm\_t *pc)}
\item Stop Bluetooth Low Energy based transport layer for provisioning.
\item Stops service/task responsible for BLE based interactions for provisioning
\item \textbf{Note} You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of \texttt{esp\_bt\_mem\_release} in that case.
\end{itemize}
Return

- ESP_OK : Success
- ESP_FAIL : Simple BLE stop error
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance

Parameters

- pc: Same protocomm instance that was passed to protocomm_ble_start()

Structures

struct name_uuid
This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

Public Members

const char *name
Name of the handler, which is passed to protocomm layer

uint16_t uuid
UUID to be assigned to the BLE characteristic which is mapped to the handler

struct protocomm_ble_config
Config parameters for protocomm BLE service.

Public Members

char device_name[MAX_BLE_DEVNAME_LEN]
BLE device name being broadcast at the time of provisioning

uint8_t service_uuid[BLE_UUID128_VAL_LENGTH]
128 bit UUID of the provisioning service

ssize_t nu_lookup_count
Number of entries in the Name-UUID lookup table

protocomm_ble_name_uuid_t *nu_lookup
Pointer to the Name-UUID lookup table

Macros

MAX_BLE_DEVNAME_LEN
BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

BLE_UUID128_VAL_LENGTH
Type Definitions

typedef struct name_uuid protocomm_ble_name_uuid_t
This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

typedef struct protocomm_ble_config protocomm_ble_config_t
Config parameters for protocomm BLE service.

2.5.2 Unified Provisioning

Overview

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. Extensible Protocol: The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.

2. Transport Flexibility: The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.

3. Security Scheme Flexibility: It’s understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that’s WPA2 protected or BLE with “just-works” security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.

4. Compact Data Representation: The protocol uses Google Protobufs as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.

Typical Provisioning Process

Deciding on Transport

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.

2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app

3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.
Fig. 23: Typical Provisioning Process

1. Transport specific discovery and connection
   - Some form of beaconing
   - Client connects

2. Session Establishment
   - Get Version Request → Get Version Response
   - Session Setup Request → Session Setup Response
   - One or multiple steps as per protocol

3. Configuration
   - App specific Set Config (optional) → Set Config Response (optional)
   - Wi-Fi SetConfig(SSID, Passphrase...)
   - Wi-Fi SetConfig response
   - Wi-Fi ApplyConfig cmd → Wi-Fi ApplyConfig resp
   - Wi-Fi GetStatus cmd (repeated) → Wi-Fi GetStatus resp (repeated)

4. Close connection
4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.

5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases

6. SoftAP based provisioning requires the phone app user to go to “System Settings” to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

Deciding on Security

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be entered on the provisioning client as a security measure to make sure that the user can provisions the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

1. **Transport Security**: SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, “just-works” security can be used as a transport level security after understanding the level of security it provides.

2. **Application Security**: The unified provisioning subsystem provides application level security (security1) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

Architecture

The below diagram shows architecture of unified provisioning.

It relies on the base layer called *Protocol Communication* (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.

Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.
Security Schemes

At present unified provisioning supports two security schemes: 1. Security0 - No security (No encryption) 2. Security1 - Curve25519 based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes:

a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key
b. No Auth (Null PoP) - Shared key derived through key exchange only

Security1 scheme details are shown in the below sequence diagram

Sample Code

Please refer to Protocol Communication and Wi-Fi Provisioning for API guides and code snippets on example usage. Various use case implementations can be found as examples under provisioning.

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- Android: esp-idf-provisioning-android
- iOS: esp-idf-provisioning-ios
- Linux/MacOS/Windows: tools/esp_prov (a python based command line tool for provisioning)
The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

### 2.5.3 Wi-Fi Provisioning

#### Overview

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure Protocol Communication (protocomm) sessions. The set of wifi_prov_mgr APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

#### Initialization

`wifi_prov_mgr_init()` is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other wifi_prov_mgr APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

```c
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};
ESP_ERR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the behavior desired of the manager:

- **`scheme`**: This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, we have three options:
  - `wifi_prov_scheme_ble`: BLE transport and GATT Server for handling provisioning commands
  - `wifi_prov_scheme_softap`: Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
  - `wifi_prov_scheme_console`: Serial transport and console for handling provisioning commands

- **`scheme_event_handler`**: An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - Free both classic BT and BLE (BTDM) memory. Used when main application doesn’t require Bluetooth at all.
- WiFi_prov_scheme_ble_event_handler_free_ble - Free only BLE memory. Used when main application requires classic BT.
- WiFi_prov_scheme_ble_event_handler_free_bt - Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
- WiFi_prov_event_handler_none - Don’t use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.

- \textit{app_event_handler} (Deprecated): It is now recommended to catch WiFi_prov_event\textapos;s that are emitted to the default event loop handler. See definition of \texttt{wifi_prov_cb_event_t} for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data){
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
        case WIFI_PROV_START:
            ESP_LOGI(TAG, "Provisioning started");
            break;
        case WIFI_PROV_CRED_RECV:
            wifi_sta_config_t* wifi_sta_cfg = (wifi_sta_config_t*)event_data;
            ESP_LOGI(TAG, "Received Wi-Fi credentials
                    SSID : %s
                    Password : %s",
                    wifi_sta_cfg->ssid,
                    wifi_sta_cfg->password);
            break;
        case WIFI_PROV_CRED_FAIL:
            wifi_prov_sta_fail_reason_t* reason = (wifi_prov_sta_fail_reason_t*)event_data;
            ESP_LOGE(TAG, "Provisioning failed!
                    Reason : %s",
                    (*reason == WIFI_PROV_STA_AUTH_ERROR) ? "Wi-Fi station authentication failed" : "Wi-Fi access-point not found");
            break;
        case WIFI_PROV_CRED_SUCCESS:
            ESP_LOGI(TAG, "Provisioning successful");
            break;
        case WIFI_PROV_END:
            /* De-initialize manager once provisioning is finished */
            wifi_prov_mgr_deinit();
            break;
        default:
            break;
        }
    }
}
```

The manager can be de-initialized at any moment by making a call to \texttt{wifi_prov_mgr_deinit()}.
Check Provisioning State

Whether device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi_` APIs to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken:

- the associated part of NVS partition has to be erased manually
- main application must implement some logic to call `esp_wifi_` APIs for erasing the credentials at runtime
- main application must implement some logic to force start the provisioning irrespective of the provisioning state

```c
bool provisioned = false;
ESP_ERR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
```

Start Provisioning Service

At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to:

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is `wifi_prov_scheme_softap`
- BLE Device name (service key is ignored) when scheme is `wifi_prov_scheme_ble`

Also, since internally the manager uses `protocomm`, we have the option of choosing one of the security features provided by it:

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (pop), followed by AES-CTR for encryption/decryption of subsequent messages
- Security 0 is simply plain text communication. In this case the pop is simply ignored

See `Provisioning` for details about the security features.

```c
const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";
ESP_ERR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );
```

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successfully connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

**Note:** If the device fails to connect with the provided credentials, it won’t accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become
Waiting For Completion

Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```c
// Start provisioning service
ESP_ERR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, →service_key) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch `WIFI_PROV_EVENT`'s and call :cpp:func:`wifi_prov_mgr_deinit()` when event ID is `WIFI_PROV_END`:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

User Side Implementation

When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to `_esp_wifi_prov`.

When using BLE transport, a custom 128 bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID will be included in the BLE advertisement and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn’t be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to `55cc035e-fb27-4f80-be02-3c60828b7451`, each endpoint characteristic will be assigned a UUID like `55cc____-fb27-4f80-be02-3c60828b7451`, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related protocomm endpoints can be identified as follows:
Table 5: Endpoints provided by Provisioning Service

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (SoftAP + HTTP Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov-session</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-session</td>
<td>Security endpoint used for session establishment</td>
</tr>
<tr>
<td>prov-scan</td>
<td>http://wifi_prov.local/prov-scan</td>
<td>Endpoint used for starting Wi-Fi scan and receiving scan results</td>
</tr>
<tr>
<td>prov-config</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-config</td>
<td>Endpoint used for configuring Wi-Fi credentials on device</td>
</tr>
<tr>
<td>proto-ver</td>
<td>http://&lt;mdns-hostname&gt;.local/proto-ver</td>
<td>Endpoint for retrieving version info</td>
</tr>
</tbody>
</table>

Immediately after connecting, the client application may fetch the version / capabilities information from the `proto-ver` endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like: `prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] },.....` Here label `prov` provides provisioning service version (`ver`) and capabilities (`cap`). For now, only `no_pop` capability is supported, which indicates that the service doesn’t require proof of possession for authentication. Any application related version / capabilities will be given by other labels (like `my_app` in this example). These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the `.proto` files found under `protocomm/proto`, which define the Protobuf message structures supported by `prov-session` endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of `wifi_config` commands, serialized as Protobuf messages (the corresponding `.proto` files can be found under `wifi_provisioning/proto`):

- `get_status` - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- `set_config` - For setting the Wi-Fi connection credentials
- `apply_config` - For applying the credentials saved during `set_config` and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the `wifi_config` commands described above. The `wifi_scan` endpoint supports the following protobuf commands:

- `scan_start` - For starting Wi-Fi scan with various options:
  - `blocking` (input) - If true, the command returns only when the scanning is finished
  - `passive` (input) - If true scan is started in passive mode (this may be slower) instead of active mode
  - `group_channels` (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and
hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for at least 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting group_channels to 4, will create 5 groups, with each group having 3 channels, except the last one which will have \( 14 \% 3 = 2 \) channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only a few channels in a group may slow down the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and hence achieve the fastest overall scanning time.

- **period_ms** (input) - Scan parameter specifying how long to wait on each channel

**scan_status** - Gives the status of scanning process:

- **scan_finished** (output) - When scan has finished this returns true
- **result_count** (output) - This gives the total number of results obtained till now. If scan is yet happening this number will keep on updating

**scan_result** - For fetching scan results. This can be called even if scan is still on going

- **start_index** (input) - Starting index from where to fetch the entries from the results list
- **count** (input) - Number of entries to fetch from the starting index
- **entries** (output) - List of entries returned. Each entry consists of ssid, channel and rssi information

**Additional Endpoints**

In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See protocomm for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```c
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler, custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call **wifi_prov_mgr_endpoint_unregister()** to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

**When / How To Stop Provisioning Service?**

The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the apply_config command, the provisioning service will be stopped (and BLE / SoftAP turned off) automatically after responding to the next get_status command. If get_status command is not received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / passphrase, the service will keep running, and get_status will keep responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials will be preserved, unless the provisioning service is force started, or NVS erased.
If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service will only be stopped after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and WIFI_PROV_END event gets emitted. This delay is specified by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange this credentials over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling `wifi_prov_mgr_stop_provisioning()` inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

**Application Examples**

For complete example implementation see provisioning/manager

**API Reference**

**Header File**

- `wifi_provisioning/include/wifi_provisioning/manager.h`

**Functions**

```c
esp_err_t wifi_prov_mgr_init (wifi_prov_mgr_config_t config)
```

Initialize provisioning manager instance.

- Configures the manager and allocates internal resources
- Configuration specifies the provisioning scheme (transport) and event handlers
- Event WIFI_PROV_INIT is emitted right after initialization is complete

**Return**

- ESP_OK: Success
- ESP_FAIL: Fail

**Parameters**

- `config`: Configuration structure

```c
void wifi_prov_mgr_deinit (void)
```

Stop provisioning (if running) and release resource used by the manager.

- Event WIFI_PROV_DEINIT is emitted right after de-initialization is finished
- If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI_PROV_END, and then performs the de-initialization

```c
esp_err_t wifi_prov_mgr_is_provisioned (bool *provisioned)
```

Checks if device is provisioned.

- This checks if Wi-Fi credentials are present on the NVS
The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component.

If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned).

**Note** Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

**Return**

- ESP_OK : Retrieved provision state successfully
- ESP_FAIL : Wi-Fi not initialized
- ESP_ERR_INVALID_ARG : Null argument supplied
- ESP_ERR_INVALID_STATE : Manager not initialized

**Parameters**

- provisioned: True if provisioned, else false

```c
esp_err_t wifi_prov_mgr_start_provisioning(wifi_prov_security_t security, const char *pop, const char *service_name, const char *service_key)
```

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :

- wifi_prov_scheme_ble : This starts protocomm_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- wifi_prov_scheme_softap : This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type _esp_wifi_prov._tcp)

Event WIFI_PROV_START is emitted right after provisioning starts without failure.

**Note** This API will start provisioning service even if device is found to be already provisioned, i.e. wifi_prov_mgr_is_provisioned() yields true

**Return**

- ESP_OK : Provisioning started successfully
- ESP_FAIL : Failed to start provisioning service
- ESP_ERR_INVALID_STATE : Provisioning manager not initialized or already started

**Parameters**

- security: Specify which protocomm security scheme to use:
  - WIFI_PROV_SECURITY_0 : For no security
  - WIFI_PROV_SECURITY_1 : x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
- pop: Pointer to proof of possession string (NULL if not needed). This is relevant only for protocomm security 1, in which case it is used for authenticating secure session
- service_name: Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
- Device name when provisioning mode is BLE
  - service_key: Key required by client to access the service (NULL if not needed). This translates to:
    - Wi-Fi password when provisioning mode is softAP
    - ignored when provisioning mode is BLE

```c
void wifi_prov_mgr_stop_provisioning (void)
```

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event WIFI_PROV_END will be emitted.

If wifi_prov_mgr_deinit() is called without calling this API first, it will automatically stop the provisioning service and emit the WIFI_PROV_END, followed by WIFI_PROV_DEINIT, before returning.

This API will generally be used along with wifi_prov_mgr_disable_auto_stop() in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient cleanup_delay, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

Cleanup_delay is set when calling wifi_prov_mgr_disable_auto_stop(). If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once WIFI_PROV_CRED_SUCCESS is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending `Wi-Fi state connected` response the service is stopped immediately.

```c
void wifi_prov_mgr_wait (void)
```

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event WIFI_PROV_END is emitted.

This will not block if provisioning is not started or not initialized.

```c
esp_err_t wifi_prov_mgr_disable_auto_stop (uint32_t cleanup_delay)
```

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call wifi_prov_mgr_stop_provisioning() later when the device is fully configured and the provisioning service is no longer required.

**Note** This must be called before executing wifi_prov_mgr_start_provisioning()

**Return**

- ESP_OK : Success
- ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started

**Parameters**

- cleanup_delay: Sets the delay after which the actual cleanup of transport related resources is done after a call to wifi_prov_mgr_stop_provisioning() returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.
esp_err_t wifi_prov_mgr_set_app_info(const char *label, const char *version, const char **capabilities, size_t total_capabilities)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

**Note** This must be called before executing wifi_prov_mgr_start_provisioning()

**Return**

- ESP_OK : Success
- ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started
- ESP_ERR_NO_MEM : Failed to allocate memory for version string
- ESP_ERR_INVALID_ARG : Null argument

**Parameters**

- label: String indicating the application name.
- version: String indicating the application version. There is no constraint on format.
- capabilities: Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- total_capabilities: Size of capabilities array

esp_err_t wifi_prov_mgr_endpoint_create(const char *ep_name)

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using wifi_prov_mgr_endpoint_register() after provisioning has started.

**Note** This API can only be called BEFORE provisioning is started

**Note** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

**Return**

- ESP_OK : Success
- ESP_FAIL : Failure

**Parameters**

- ep_name: unique name of the endpoint
```c
esp_err_t wifi_prov_mgr_endpoint_register (const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)
```

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using wifi_prov_mgr_endpoint_create().

**Note** This API can only be called AFTER provisioning has started

**Note** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

**Return**

- ESP_OK : Success
- ESP_FAIL : Failure

**Parameters**

- ep_name: Name of the endpoint
- handler: Endpoint handler function
- user_ctx: User data

```c
void wifi_prov_mgr_endpoint_unregister (const char *ep_name)
```

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

**Parameters**

- ep_name: Name of the endpoint

```c
esp_err_t wifi_prov_mgr_event_handler (void *ctx, system_event_t *event)
```

Event handler for provisioning manager.

This is called from the main event handler and controls the provisioning manager’s internal state machine depending on incoming Wi-Fi events

**Note**: This function is DEPRECATED, because events are now handled internally using the event loop library, esp_event. Calling this will do nothing and simply return ESP_OK.

**Return**

- ESP_OK : Event handled successfully

**Parameters**

- ctx: Event context data
- event: Event info

```c
esp_err_t wifi_prov_mgr_get_wifi_state (wifi_prov_sta_state_t *state)
```

Get state of Wi-Fi Station during provisioning.
Return

- ESP_OK : Successfully retrieved Wi-Fi state
- ESP_FAIL : Provisioning app not running

Parameters

- state: Pointer to wifi_prov_sta_state_t variable to be filled

\[ \text{esp_err_t wifi_prov_mgr_get_wifi_disconnect_reason (wifi_prov_sta_fail_reason_t *reason) } \]
Get reason code in case of Wi-Fi station disconnection during provisioning.

Return

- ESP_OK : Successfully retrieved Wi-Fi disconnect reason
- ESP_FAIL : Provisioning app not running

Parameters

- reason: Pointer to wifi_prov_sta_fail_reason_t variable to be filled

\[ \text{esp_err_t wifi_prov_mgr_configure_sta (wifi_config_t *wifi_cfg) } \]
Runs Wi-Fi as Station with the supplied configuration.
Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.
This is automatically called by provisioning service upon receiving new credentials.
If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.
Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started

Return

- ESP_OK : Wi-Fi configured and started successfully
- ESP_FAIL : Failed to set configuration

Parameters

- wifi_cfg: Pointer to Wi-Fi configuration structure

Structures

struct wifi_prov_event_handler_t
Event handler that is used by the manager while provisioning service is active.

Public Members

wifi_prov_cb_func_t event_cb
Callback function to be executed on provisioning events

void *user_data
User context data to pass as parameter to callback function

struct wifi_prov_scheme
Structure for specifying the provisioning scheme to be followed by the manager.
Note: Ready to use schemes are available:

- wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

Public Members

```c
esp_err_t (*prov_start) (protocomm_t *pc, void *config)
```
Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

```c
esp_err_t (*prov_stop) (protocomm_t *pc)
```
Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance

```c
void (*new_config) (void)
```
Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to prov_start()

```c
void (*delete_config) (void *config)
```
Function which is to be called by the manager to delete a configuration generated using new_config()

```c
esp_err_t (*set_config_service) (void *config, const char *service_name, const char *service_key)
```
Function which is to be called by the manager to set the service name and key values in the configuration structure

```c
esp_err_t (*set_config_endpoint) (void *config, const char *endpoint_name, uint16_t uuid)
```
Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure

```c
wifi_mode_t wifi_mode
```
Sets mode of operation of Wi-Fi during provisioning. This is set to:

- WIFI_MODE_APSTA for SoftAP transport
- WIFI_MODE_STA for BLE transport

```c
struct wifi_prov_mgr_config_t
```
Structure for specifying the manager configuration.

Public Members

```c
wifi_prov_scheme_t scheme
```
Provisioning scheme to use. Following schemes are already available:

- wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

```c
wifi_prov_event_handler_t scheme_event_handler
```
Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use WIFI_PROV_EVENT_HANDLER_NONE when not used. When using scheme wifi_prov_scheme_ble, the following options are available:
• WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
• WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
• WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

**wifi_prov_event_handler_t** app_event_handler
Event handler that can be set for the purpose of incorporating application specific behavior. Use WIFI_PROV_EVENT_HANDLER_NONE when not used.

### Macros

**WIFI_PROV_EVENT_HANDLER_NONE**
Event handler can be set to none if not used.

### Type Definitions

**typedef** void (*wifi_prov_cb_func_t)(void *user_data, wifi_prov_cb_event_t event, void *event_data)

**typedef struct wifi_prov_scheme wifi_prov_scheme_t**
Structure for specifying the provisioning scheme to be followed by the manager.

**Note** Ready to use schemes are available:
- wifi_prov_scheme_ble : for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap : for provisioning over SoftAP transport + HTTP server
- wifi_prov_scheme_console : for provisioning over Serial UART transport + Console (for debugging)

**typedef enum wifi_prov_security wifi_prov_security_t**
Security modes supported by the Provisioning Manager.
These are same as the security modes provided by protocomm

### Enumerations

**enum wifi_prov_cb_event_t**
Events generated by manager.
These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

**Values:**

**WIFI_PROV_INIT**
Emitted when the manager is initialized

**WIFI_PROV_START**
Indicates that provisioning has started

**WIFI_PROV_CRED_RECV**
Emitted when Wi-Fi AP credentials are received via protocomm endpoint wifi_config. The event data in this case is a pointer to the corresponding wifi_sta_config_t structure
**WIFI_PROV_CRED_FAIL**
Emitted when device fails to connect to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV. The event data in this case is a pointer to the disconnection reason code with type wifi_prov_sta_fail_reason_t.

**WIFI_PROV_CRED_SUCCESS**
Emitted when device successfully connects to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV.

**WIFI_PROV_END**
Signals that provisioning service has stopped.

**WIFI_PROV_DEINIT**
Signals that manager has been de-initialized.

**enum wifi_prov_security**
Security modes supported by the Provisioning Manager.
These are same as the security modes provided by protocomm.

**Values:**

**WIFI_PROV_SECURITY_0 = 0**
No security (plain-text communication)

**WIFI_PROV_SECURITY_1**
This secure communication mode consists of X25519 key exchange
- proof of possession (pop) based authentication
- AES-CTR encryption

**Header File**

- wifi_provisioning/include/wifi_provisioning/scheme_ble.h

**Functions**

void **wifi_prov_scheme_ble_event_cb_free_btdm**(void *user_data, wifi_prov_cb_event_t event, void *event_data)
void **wifi_prov_scheme_ble_event_cb_free_ble**(void *user_data, wifi_prov_cb_event_t event, void *event_data)
void **wifi_prov_scheme_ble_event_cb_free_bt**(void *user_data, wifi_prov_cb_event_t event, void *event_data)

esp_err_t **wifi_prov_scheme_ble_set_service_uuid**(uint8_t *uuid128)
Set the 128 bit GATT service UUID used for provisioning.
This API is used to override the default 128 bit provisioning service UUID, which is 0000ffff-0000-1000-8000-00805f9b34fb.
This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning(), otherwise the default UUID will be used.

**Note** The data being pointed to by the argument must be valid atleast till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwards.

**Return**
• ESP_OK : Success
• ESP_ERR_INVALID_ARG : Null argument

Parameters
• uuid128: A custom 128 bit UUID

Macros

WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

Header File

• wifi_provisioning/include/wifi_provisioning/scheme_softap.h

Functions

void wifi_prov_scheme_softap_set_httpd_handle (void *handle)
Provide HTTPD Server handle externally.
Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

Note This API should be called before wifi_prov_mgr_start_provisioning()

Parameters
• handle: Handle to HTTPD server instance

Header File

• wifi_provisioning/include/wifi_provisioning/scheme_console.h

Header File

• wifi_provisioning/include/wifi_provisioning/wifi_config.h

Functions

esp_err_t wifi_prov_config_data_handler (uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
Handler for receiving and responding to requests from master.
This is to be registered as the wifi_config endpoint handler (protocomm protocomm_req_handler_t) using protocomm_add_endpoint()
Structures

```c
struct wifi_prov_sta_conn_info_t
	WiFi STA connected status information.
```

**Public Members**

- `char ip_addr[IP4ADDR_STRLEN_MAX]`
  IP Address received by station
- `char bssid[6]`
  BSSID of the AP to which connection was established
- `char ssid[33]`
  SSID of the to which connection was established
- `uint8_t channel`
  Channel of the AP
- `uint8_t auth_mode`
  Authorization mode of the AP

```c
struct wifi_prov_config_get_data_t
	WiFi status data to be sent in response to get_status request from master.
```

**Public Members**

- `wifi_prov_sta_state_t wifi_state`
  WiFi state of the station
- `wifi_prov_sta_fail_reason_t fail_reason`
  Reason for disconnection (valid only when wifi_state is WIFI_STATION_DISCONNECTED)
- `wifi_prov_sta_conn_info_t conn_info`
  Connection information (valid only when wifi_state is WIFI_STATION_CONNECTED)

```c
struct wifi_prov_config_set_data_t
	WiFi config data received by slave during set_config request from master.
```

**Public Members**

- `char ssid[33]`
  SSID of the AP to which the slave is to be connected
- `char password[64]`
  Password of the AP
- `char bssid[6]`
  BSSID of the AP
- `uint8_t channel`
  Channel of the AP

```c
struct wifi_prov_config_handlers
	Internal handlers for receiving and responding to protocomm requests from master.
```

This is to be passed as priv_data for protocomm request handler (refer to wifi_prov_config_data_handler() when calling protocomm_add_endpoint()).
**Public Members**

`esp_err_t (*get_status_handler)(wifi_prov_config_get_data_t *resp_data, wifi_prov_ctx_t **ctx)`  
Handler function called when connection status of the slave (in WiFi station mode) is requested

`esp_err_t (*set_config_handler)(const wifi_prov_config_set_data_t *req_data, wifiProv_ctx_t **ctx)`  
Handler function called when WiFi connection configuration (e.g., AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

`esp_err_t (*apply_config_handler)(wifiProv_ctx_t **ctx)`  
Handler function for applying the configuration that was set in `set_config_handler`. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when `get_status_handler` is invoked again by the master.

`wifiProv_ctx_t *ctx`  
Context pointer to be passed to above handler functions upon invocation

**Type Definitions**

```c
typedef struct wifiProv_ctx wifiProv_ctx_t
```
Type of context data passed to each get/set/apply handler function set in `wifiProv_config_handlers` structure.

This is passed as an opaque pointer, thereby allowing it to be defined later in application code as per requirements.

```c
typedef struct wifiProv_config_handlers wifiProv_config_handlers_t
```
Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as priv_data for protocomm request handler (refer to `wifiProv_config_data_handler()`) when calling `protocomm_add_endpoint()`.

**Enumerations**

```c
enum wifiProv_sta_state_t
```
WiFi STA status for conveying back to the provisioning master.

Values:

- `WIFI_PROV_STA_CONNECTING`
- `WIFI_PROV_STA_CONNECTED`
- `WIFI_PROV_STA_DISCONNECTED`

```c
enum wifiProv_sta_fail_reason_t
```
WiFi STA connection fail reason.

Values:

- `WIFI_PROV_STA_AUTH_ERROR`
- `WIFI_PROV_STA_AP_NOT_FOUND`

Code examples for this API section are provided in the `provisioning` directory of ESP-IDF examples.
2.6 Storage API

2.6.1 FAT Filesystem Support

ESP-IDF uses the FatFs library to work with FAT filesystems. FatFs resides in the fatfs component. Although the library can be used directly, many of its features can be accessed via VFS, using the C standard library and POSIX API functions.

Additionally, FatFs has been modified to support the runtime pluggable disk I/O layer. This allows mapping of FatFs drives to physical disks at runtime.

Using FatFs with VFS

The header file fatfs/vfs/esp_vfs_fat.h defines the functions for connecting FatFs and VFS.

The function esp_vfs_fat_register() allocates a FATFS structure and registers a given path prefix in VFS. Subsequent operations on files starting with this prefix are forwarded to FatFs APIs. The function esp_vfs_fat_unregister_path() deletes the registration with VFS, and frees the FATFS structure.

Most applications use the following workflow when working with esp_vfs_fat_ functions:

1. Call esp_vfs_fat_register() to specify:
   - Path prefix where to mount the filesystem (e.g. "/sdcard", "/spiflash")
   - FatFs drive number
   - A variable which will receive the pointer to the FATFS structure

2. Call ff_diskio_register() to register the disk I/O driver for the drive number used in Step 1.

3. Call the FatFs function f_mount, and optionally f_fdisk, f_mkfs, to mount the filesystem using the same drive number which was passed to esp_vfs_fat_register(). For more information, see FatFs documentation <http://www.elm-chan.org/fsw/fj/doc/mount.html>.

4. Call the C standard library and POSIX API functions to perform such actions on files as open, read, write, erase, copy, etc. Use paths starting with the path prefix passed to esp_vfs_register() (for example, "/sdcard/hello.txt").

5. Optionally, call the FatFs library functions directly. In this case, use paths without a VFS prefix (for example, "/hello.txt").

6. Close all open files.

7. Call the FatFs function f_mount for the same drive number, with NULL FATFS* argument, to unmount the filesystem.

8. Call the FatFs function ff_diskio_register() with NULL ff_diskio_impl_t* argument and the same drive number to unregister the disk I/O driver.

9. Call esp_vfs_fat_unregister_path() with the path where the file system is mounted to remove FatFs from VFS, and free the FATFS structure allocated in Step 1.

The convenience functions esp_vfs_fat_sdmmc_mount and esp_vfs_fat_sdmmc_unmount wrap the steps described above and also handle SD card initialization. These two functions are described in the next section.
**esp_err_t esp_vfs_fat_register**(const char *base_path, const char *fat_drive, size_t max_files, FATFS **out_fs)

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, fat_drive argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for f_mount call.

**Note** This function doesn’t mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_register was already called
- ESP_ERR_NO_MEM if not enough memory or too many VFSes already registered

**Parameters**

- **base_path**: path prefix where FATFS should be registered
- **fat_drive**: FATFS drive specification; if only one drive is used, can be an empty string
- **max_files**: maximum number of files which can be open at the same time
- **out_fs**: pointer to FATFS structure which can be used for FATFS f_mount call is returned via this argument.

**esp_err_t esp_vfs_fat_unregister_path**(const char *base_path)

Un-register FATFS from VFS.

**Note** FATFS structure returned by esp_vfs_fat_register is destroyed after this call. Make sure to call f_mount function to unmount it before calling esp_vfs_fat_unregister_ctx. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

**Parameters**

- **base_path**: path prefix where FATFS is registered. This is the same used when esp_vfs_fat_register was called

### Using FatFs with VFS and SD cards

The header file `fatfs/vfs/esp_vfs_fat.h` defines convenience functions `esp_vfs_fat_sdmmc_mount()` and `esp_vfs_fat_sdmmc_unmount()`. These function perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function `esp_vfs_fat_sdmmc_unmount()` unmounts the filesystem and releases the resources acquired by `esp_vfs_fat_sdmmc_mount()`.
Esp_err_t esp_vfs_fat_sdmmc_mount(const char *base_path, const sdmmc_host_t *host_config, const void *slot_config, const esp_vfs_fat_mount_config_t *mount_config, sdmmc_card_t **out_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in host_config
- initializes SD card with configuration in slot_config
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

Parameters

- base_path: path where partition should be registered (e.g. “/sdcard”)
- host_config: Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using SDMMC_HOST_DEFAULT() macro. When using SPI peripheral, this structure can be initialized using SDSPI_HOST_DEFAULT() macro.
- slot_config: Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to sdmmc_slot_config_t structure initialized using SDMMC_SLOT_CONFIG_DEFAULT. For SPI peripheral, pass a pointer to sdspi_slot_config_t structure initialized using SD-SPI_SLOT_CONFIG_DEFAULT.
- mount_config: pointer to structure with extra parameters for mounting FATFS
- out_card: if not NULL, pointer to the card information structure will be returned via this argument

struct esp_vfs_fat_mount_config_t

Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount functions.

Public Members

bool format_if_mount_failed

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int max_files

Max number of open files.

size_t allocation_unit_size

If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be
a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For
wear_levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when
storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

```
esp_err_t esp_vfs_fat_sdmmcUnmount (void)
Unmount FAT filesystem and release resources acquired using esp_vfs_fat_sdmmc_mount.
```

Return

• ESP_OK on success
• ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount hasn’t been called

Using FatFs with VFS in read-only mode

The header file fatfs/vfs/esp_vfs_fat.h also defines the convenience functions
esp_vfs_fat_rawflash_mount() and esp_vfs_fat_rawflashUnmount(). These functions
perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for data partitions
written only once during factory provisioning which will not be changed by production application throughout the
lifetime of the hardware.

```
esp_err_t esp_vfs_fat_rawflash_mount (const char *base_path, const char *partition_label,
const esp_vfs_fat_mount_config_t *mount_config)
Convenience function to initialize read-only FAT filesystem and register it in VFS.
```

This is an all-in-one function which does the following:

• finds the partition with defined partition_label. Partition label should be configured in the partition table.
• mounts FAT partition using FATFS library
• registers FATFS library with VFS, with prefix given by base_prefix variable

Note Wear levelling is not used when FAT is mounted in read-only mode using this function.

Return

• ESP_OK on success
• ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
• ESP_ERR_INVALID_STATE if esp_vfs_fat_rawflash_mount was already called for the same parti-
tion
• ESP_ERR_NO_MEM if memory can not be allocated
• ESP_FAIL if partition can not be mounted
• other error codes from SPI flash driver, or FATFS drivers

Parameters

• base_path: path where FATFS partition should be mounted (e.g. “/spiflash”)
• partition_label: label of the partition which should be used
• mount_config: pointer to structure with extra parameters for mounting FATFS
esp_err_t esp_vfs_fat_rawflash_unmount(const char *base_path, const char *partition_label)

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_rawflash_mount.

Return

• ESP_OK on success
• ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount hasn’t been called

Parameters

• base_path: path where partition should be registered (e.g. “/spiflash”)
• partition_label: label of partition to be unmounted

FatFS disk IO layer

FatFs has been extended with API functions that register the disk I/O driver at runtime.

They provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function ff_diskio_register_sdmmc().

void ff_diskio_register (BYTE pdrv, const ff_diskio_impl_t *discio_impl)

Register or unregister diskio driver for given drive number.

When FATFS library calls one of disk_xxx functions for driver number pdrv, corresponding function in discio_impl for given pdrv will be called.

Parameters

• pdrv: drive number
• discio_impl: pointer to ff_diskio_impl_t structure with diskio functions or NULL to unregister and free previously registered drive

struct ff_diskio_impl_t

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

Public Members

DSTATUS (*init)(unsigned char pdrv)
disk initialization function

DSTATUS (*status)(unsigned char pdrv)
disk status check function

DRESULT (*read)(unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)
sector read function

DRESULT (*write)(unsigned char pdrv, const unsigned char *buff, uint32_t sector, unsigned count)
sector write function

DRESULT (*ioctl)(unsigned char pdrv, unsigned char cmd, void *buff)
function to get info about disk and do some misc operations

void ff_diskio_register_sdmmc (unsigned char pdrv, sdmmc_card_t *card)
Register SD/MMC diskio driver

Parameters
• `pdrv`: drive number
• `card`: pointer to `sdmmc_card_t` structure describing a card; card should be initialized before calling `f_mount`.

`esp_err_t ff_diskio_register_wl_partition(unsigned char pdrv, wl_handle_t flash_handle)`
Register spi flash partition

**Parameters**
- `pdrv`: drive number
- `flash_handle`: handle of the wear levelling partition.

`esp_err_t ff_diskio_register_raw_partition(unsigned char pdrv, const esp_partition_t *part_handle)`
Register spi flash partition

**Parameters**
- `pdrv`: drive number
- `part_handle`: pointer to raw flash partition.

### 2.6.2 Manufacturing Utility

[]

**Introduction**

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufacturing purposes. The NVS partition images are created from CSV files containing user-provided configurations and values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices using:

- `esptool.py`
- Flash Download tool (available on Windows only)
- Direct flash programming

**Prerequisites**

This utility is dependent on esp-idf’s NVS partition utility.

- **Operating System requirements:**
  - Linux / MacOS / Windows (standard distributions)
- **The following packages are needed to use this utility:**
  - Python: &lt;https://www.python.org/downloads/&gt;

**Note:**

Before using this utility, please make sure that:
• The path to Python is added to the PATH environment variable.
• You have installed the packages from requirement.txt, the file in the root of the esp-idf directory.

Workflow

CSV Configuration file → Master Value CSV file → Binary files

CSV Configuration File

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the REPEAT tag is optional):

```
name1,namespace,  <-- First entry should be of type "namespace"
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

Note: The first line in this file should always be the namespace entry.

Each line should have three parameters: key, type, encoding, separated by a comma. If the REPEAT tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

*Please refer to README of the NVS Partition Generator utility for detailed description of each parameter.*

Below is a sample example of such a configuration file:

```
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

Note:

Make sure there are no spaces:
• before and after ','
• at the end of each line in a CSV file
Master Value CSV File

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

The data in the master value CSV file has the following format:

```
key1,key2,key3,......
value1,value2,value3,......
```

**Note:** The first line in the file should always contain the *key* names. All the keys from the configuration file should be present here in the *same order*. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.

Each line should contain the *value* of the corresponding keys, separated by a comma. If the key has the `REPEAT` tag, its corresponding value *must* be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:

**value**  Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

```
id,firmware_key,serial_no,device_no
1,la2b3c4d5e6faabb,A1,101
2,la2b3c4d5e6fccdd,,102
3,la2b3c4d5e6feeff,,103
```

**Note:** *If the ‘REPEAT’ tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the ‘REPEAT’ tag.*

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:

```
key,type,encoding,value
key,namespace, ,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

An instance of an intermediate CSV file will be created for each device on an individual basis.

**Running the utility**

**Usage:**

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

Optional Arguments:

```
+------------------+
<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-----</td>
<td>--------------</td>
<td>-------------</td>
</tr>
<tr>
<td>-----</td>
<td>--------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
```

(continues on next page)
To generate factory images for each device (Default):

Usage:

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen] [--keyfile KEYFILE] [--inputkey INPUTKEY] [--outdir OUTDIR] conf values prefix size
```

Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conf</td>
<td>Path to configuration csv file to parse</td>
</tr>
<tr>
<td>values</td>
<td>Path to values csv file to parse</td>
</tr>
<tr>
<td>prefix</td>
<td>Unique name for each output filename prefix</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes</td>
</tr>
</tbody>
</table>

Optional Arguments:

(continues on next page)
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td>--fileid FILEID</td>
<td>Unique file identifier (any key in values file) for each filename suffix (Default: numeric value 1, 2, 3...)</td>
</tr>
<tr>
<td>--keygen</td>
<td>Generates key for encrypting NVS partition</td>
</tr>
<tr>
<td>--inputkey INPUTKEY</td>
<td>File having key for encrypting NVS partition</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_singlepage_blob.csv Sample 0x3000
```

The master value CSV file should have the path in the file type relative to the directory from which you are running the utility.

**To generate encrypted factory images for each device:**

You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_singlepage_blob.csv Sample 0x3000 --keygen
```
Note: Encryption key of the following format `<outdir>/keys/keys-<prefix>-<fileid>.bin` is created.

Note: This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to [NVS key partition](#) for more details.

- Encrypt by providing the encryption keys as input binary file:

```bash
generate samples/sample_config.csv samples/sample_values_singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

**To generate only encryption keys: Usage:**

```bash
generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

<table>
<thead>
<tr>
<th>Optional Arguments:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>-h, --help</td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
</tr>
</tbody>
</table>

You can run the utility to generate only encryption keys using the command below:

```bash
generate-key
```

Note: Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created. Timestamp format is: %m-%d_%H-%M.

Note: To provide custom target filename use the --keyfile argument.

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis. The default numeric value: 1,2,3... of the fileid argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified `outdir` directory:

- `bin/` for storing the generated binary files
• csv/ for storing the generated intermediate CSV files
• keys/ for storing encryption keys (when generating encrypted factory images)

2.6.3 Non-volatile storage library

Introduction

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.

Underlying storage

Currently, NVS uses a portion of main flash memory through `spi_flash_{read|write|erase}` APIs. The library uses all the partitions with `data` type and `nvs` subtype. The application can choose to use the partition with the label `nvs` through the `nvs_open` API function or any other partition by specifying its name using the `nvs_open_from_part` API function.

Future versions of this library may have other storage backends to keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

Note: if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides a `idf.py erase_flash` target to erase all contents of the flash chip.

Note: NVS works best for storing many small values, rather than a few large values of the type ‘string’ and ‘blob’. If you need to store large blobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.

Keys and values

NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

• integer types: `uint8_t`, `int8_t`, `uint16_t`, `int16_t`, `uint32_t`, `int32_t`, `uint64_t`, `int64_t`
• zero-terminated string
• variable length binary data (blob)

Note: String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.

Additional types, such as `float` and `double` might be added later.

Keys are required to be unique. Assigning a new value to an existing key works as follows:

• if the new value is of the same type as the old one, value is updated
• if the new value has a different data type, an error is returned

Data type check is also performed when reading a value. An error is returned if the data type of the read operation does not match the data type of the value.

Namespaces

To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Namespace name is specified in the `nvs_open` or `nvs_open_from_part` call. This call returns an opaque handle, which is used in subsequent calls to the `nvs_get_*`, `nvs_set_*`, and `nvs_commit` functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.

Security, tampering, and robustness

NVS is not directly compatible with the ESP32 flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with ESP32 flash encryption. Please refer to NVS Encryption for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against the erase operation.

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one should be able to power off the device at any point and time and then power it back on. This should not result in loss of data, except for the new key-value pair if it was being written at the moment of powering off. The library should also be able to initialize properly with any random data present in flash memory.

Internals

Log of key-value pairs

NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.

Pages and entries

NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a sequence number associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

- **Empty/uninitialized** Flash storage for the page is empty (all bytes are 0xff). Page is not used to store any data at this point and does not have a sequence number.
- **Active** Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.
- **Full** Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.
Erasing  Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.

Corrupted Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in uninitialized state for later use. This may be useful for debugging.

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

Structure of a page

For now, we assume that flash sector size is 4096 bytes and that ESP32 flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via menuconfig) to accommodate flash chips with different sector sizes (although it is not clear if other components in the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).

Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with ESP32 flash encryption, entry size is 32 bytes. For integer types, entry holds one key-value pair. For strings and blobs, an entry holds part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.

Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption feature of ESP32 is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore it is not necessary to erase the page to change its state unless that is a change to the erased state.
The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xfe for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

### Entry and entry state bitmap

Each entry can be in one of the following three states represented with two bits in the entry state bitmap. The final four bits in the bitmap (256 - 2 * 126) are not used.

- **Empty (2'b11)** Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).
- **Written (2'b10)** A key-value pair (or part of key-value pair which spans multiple entries) has been written into the entry.
- **Erased (2'b00)** A key-value pair in this entry has been discarded. Contents of this entry will not be parsed anymore.

### Structure of entry

For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is stored called “blob index”. Earlier formats of blobs are still supported (can be read and modified). However, once the blobs are modified, they are stored using the new format.

</tbody>
</table>

Individual fields in entry structure have the following meanings:

- **NS** Namespace index for this entry. For more information on this value, see the section on namespaces implementation.
- **Type** One byte indicating the value data type. See the ItemType enumeration in nvs_types.h for possible values.
Span Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this depends on value length.

ChunkIndex Used to store the index of a blob-data chunk for blob types. For other types, this should be 0xff.

CRC32 Checksum calculated over all the bytes in this entry, except for the CRC32 field itself.

Key Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero terminator.

Data For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to the right, with unused bytes filled with 0xff.

For “blob index” entry, these 8 bytes hold the following information about data-chunks:

- **Size** (Only for blob index.) Size, in bytes, of complete blob data.
- **ChunkCount** (Only for blob index.) Total number of blob-data chunks into which the blob was divided during storage.
- **ChunkStart** (Only for blob index.) ChunkIndex of the first blob-data chunk of this blob. Subsequent chunks have chunkIndex incrementally allocated (step of 1).

For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:

- **Size** (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.
- **CRC32** (Only for strings and blobs.) Checksum calculated over all bytes of data.

Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The Span field of the first entry indicates how many entries are used.

### Namespaces

As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers (strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are indexes of these namespaces.

| NS=0 Type=uint8_t Key="wifi" Value=1 | Entry describing namespace "wifi" |
| NS=1 Type=uint32_t Key="channel" Value=6 | Key "channel" in namespace "wifi" |
| NS=0 Type=uint8_t Key="pwm" Value=2 | Entry describing namespace "pwm" |
| NS=2 Type=uint16_t Key="channel" Value=20 | Key "channel" in namespace "pwm" |

### Item hash list

To reduce the number of reads from flash memory, each member of the Page class maintains a list of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading them from flash one at a time, Page::findItem first performs a search for the item hash in the hash list. This gives the item index within the page if such an item exists. Due to a hash collision, it is possible that a different item will be found. This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace, key name, and ChunkIndex. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds 29
entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

**NVS Encryption**

Data stored in NVS partitions can be encrypted using AES-XTS in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one sector and relative address of the entry (w.r.t. partition-start) is fed to the encryption algorithm as sector-number. The keys required for NVS encryption are stored in yet another partition, which is protected using *Flash Encryption*. Therefore, enabling *Flash Encryption* is a prerequisite for NVS encryption.

**NVS key partition**

An application requiring NVS encryption support needs to be compiled with a key-partition of the type *data* and subtype *key*. This partition should be marked as encrypted. Refer to *Partition Tables* for more details. The size of the partition should be 4096 bytes (minimum partition size). The structure of this partition is depicted below.

```
+---------------------------------------------+            +---------------------------------------------+
| XTS encryption key (32)                   |            | XTS tweak key (32)                          |
+---------------------------------------------+            +---------------------------------------------+
| CRC32 (4)                                  |
```

This partition can be generated using *nvs partition generator* utility and flashed onto the device. Since the partition is marked encrypted and *Flash Encryption* is enabled, bootloader will encrypt this partition using flash encryption key on the first boot. Alternatively, the keys can be generated after startup using the *nvs_flash_generate_keys* API function provided by *nvs_flash.h*, which will then write those keys onto the key-partition in encrypted form.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-partitions. However, it is a responsibility of the application to provide correct key-partition/keys for the purpose of encryption/decryption.

**Encrypted Read/Write**

The same NVS API functions *nvs_get_* or *nvs_set_* can be used for reading of, and writing to an encrypted nvs partition as well. However, the API functions for initialising NVS partitions are different: *nvs_flash_secure_init* and *nvs_flash_secure_init_partition* instead of *nvs_flash_init* and *nvs_flash_init_partition* respectively. The *nvs_sec_cfg_t* structure required for these API functions can be populated using *nvs_flash_read_security_cfg* or *nvs_flash_generate_keys*.

Applications are expected to follow the steps below in order to perform NVS read/write operations with encryption enabled.

1. Find key partition and NVS data partition using *esp_partition_find_* API functions.
2. Populate the *nvs_sec_cfg_t* struct using the *nvs_flash_read_security_cfg* or *nvs_flash_generate_keys* API functions.
3. Initialise NVS flash partition using the *nvs_flash_secure_init* or *nvs_flash_secure_init_partition* API functions.
4. Open a namespace using the *nvs_open* or *nvs_open_from_part* API functions.
5. Perform NVS read/write operations using *nvs_get_* or *nvs_set_*.
6. De initialise an NVS partition using `nvs_flash_deinit`.

**NVS iterators**

Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type.

There are the following functions available:

- `nvs_entry_find` returns an opaque handle, which is used in subsequent calls to the `nvs_entry_next` and `nvs_entry_info` functions.
- `nvs_entry_next` returns iterator to the next key-value pair.
- `nvs_entry_info` returns information about each key-value pair.

If none or no other key-value pair was found for given criteria, `nvs_entry_find` and `nvs_entry_next` return NULL. In that case, the iterator does not have to be released. If the iterator is no longer needed, you can release it by using the function `nvs_release_iterator`.

**NVS Partition Generator Utility**

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details, please refer to *NVS Partition Generator Utility*.

**Application Example**

You can find two code examples in the `storage` directory of ESP-IDF examples:

- `storage/nvs_rw_value`
  
  Demonstrates how to read a single integer value from, and write it to NVS.
  
  The value checked in this example holds the number of the ESP32 module restarts. The value’s function as a counter is only possible due to its storing in NVS.
  
  The example also shows how to check if a read / write operation was successful, or if a certain value has not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the program flow and capture any issues on the way.

- `storage/nvs_rw_blob`
  
  Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32 module restarts.
  
  - value - tracks the number of the ESP32 module soft and hard restarts.
  
  - blob - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.
  
  The example also shows how to implement the diagnostic procedure to check if the read / write operation was successful.
API Reference

Header File

- nvs_flash/include/nvs_flash.h

Functions

`esp_err_t nvs_flash_init (void)`

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**Return**

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- one of the error codes from the underlying flash storage driver

`esp_err_t nvs_flash_init_partition (const char *partition_label)`

Initialize NVS flash storage for the specified partition.

**Return**

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- one of the error codes from the underlying flash storage driver

**Parameters**

- `partition_label`: Label of the partition. Must be no longer than 16 characters.

`esp_err_t nvs_flash_deinit (void)`

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

**Return**

- ESP_OK on success (storage was deinitialized)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call

`esp_err_t nvs_flash_deinit_partition (const char *partition_label)`

Deinitialize NVS storage for the given NVS partition.

**Return**

- ESP_OK on success
• ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

Parameters

• partition_label: Label of the partition

```c
esp_err_t nvs_flash_erase(void)
```

Erase the default NVS partition.

This function erases all contents of the default NVS partition (one with label “nvs”)

Return

• ESP_OK on success
• ESP_ERR_NOT_FOUND if there is no NVS partition labeled “nvs” in the partition table

```c
esp_err_t nvs_flash_erase_partition(const char *part_name)
```

Erase specified NVS partition.

This function erases all contents of specified NVS partition

Return

• ESP_OK on success
• ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table

Parameters

• part_name: Name (label) of the partition to be erased

```c
esp_err_t nvs_flash_secure_init(nvs_sec_cfg_t *cfg)
```

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

Return

• ESP_OK if storage was successfully initialized.
• ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
• ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
• one of the error codes from the underlying flash storage driver

Parameters

• cfg: Security configuration (keys) to be used for NVS encryption/decryption. If cfg is NULL, no encryption is used.

```c
esp_err_t nvs_flash_secure_init_partition(const char *partition_label, nvs_sec_cfg_t *cfg)
```

Initialize NVS flash storage for the specified partition.

Return

• ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- one of the error codes from the underlying flash storage driver

Parameters

- `partition_label`: Label of the partition. Note that internally a reference to passed value is kept and it should be accessible for future operations
- `cfg`: Security configuration (keys) to be used for NVS encryption/decryption. If `cfg` is null, no encryption/decryption is used.

```c
esp_err_t nvs_flash_generate_keys(const esp_partition_t *partition, nvs_sec_cfg_t *cfg)
```
Generate and store NVS keys in the provided esp partition.

Return
-ESP_OK, if `cfg` was read successfully; -or error codes from `esp_partition_write/erase` APIs.

Parameters

- `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `cfg`: Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

```c
esp_err_t nvs_flash_read_security_cfg(const esp_partition_t *partition, nvs_sec_cfg_t *cfg)
```
Read NVS security configuration from a partition.

Note
Provided partition is assumed to be marked ‘encrypted’.

Return
-ESP_OK, if `cfg` was read successfully; -ESP_ERR_NVS_KEYS_NOT_INITIALIZED, if the partition is not yet written with keys. -ESP_ERR_NVS_CORRUPT_KEY_PART, if the partition containing keys is found to be corrupt -or error codes from `esp_partition_read` API.

Parameters

- `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `cfg`: Pointer to nvs security configuration structure. Pointer must be non-NULL.

Structures

```c

Functions

```c
esp_err_t nvs_set_i8(nvs_handle_t handle, const char *key, int8_t value)
```

set value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until nvs_commit function is called.

Return

- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the string value is too long

Parameters

- handle: Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- key: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn’t be empty.
- value: The value to set. For strings, the maximum length (including null character) is 4000 bytes.

```c
esp_err_t nvs_set_u8(nvs_handle_t handle, const char *key, uint8_t value)
esp_err_t nvs_set_i16(nvs_handle_t handle, const char *key, int16_t value)
esp_err_t nvs_set_u16(nvs_handle_t handle, const char *key, uint16_t value)
esp_err_t nvs_set_i32(nvs_handle_t handle, const char *key, int32_t value)
esp_err_t nvs_set_u32(nvs_handle_t handle, const char *key, uint32_t value)
esp_err_t nvs_set_i64(nvs_handle_t handle, const char *key, int64_t value)
esp_err_t nvs_set_u64(nvs_handle_t handle, const char *key, uint64_t value)
esp_err_t nvs_set_str(nvs_handle_t handle, const char *key, const char *value)
```
esp_err_t nvs_get_i8 (nvs_handle_t handle, const char *key, int8_t *out_value)

get value for given key

These functions retrieve value for the key, given its name. If key does not exist, or the requested variable type
doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, out_value is not modified.

All functions expect out_value to be a pointer to an already allocated variable of the given type.

// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert (err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.

Return

• ESP_OK if the value was retrieved successfully
• ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
• ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
• ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

Parameters

• handle: Handle obtained from nvs_open function.
• key: Key name. Maximal length is determined by the underlying implementation, but is guaranteed
to be at least 15 characters. Shouldn’t be empty.
• out_value: Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this
case required length will be returned in length argument.

esp_err_t nvs_get_u8 (nvs_handle_t handle, const char *key, uint8_t *out_value)
esp_err_t nvs_get_i16 (nvs_handle_t handle, const char *key, int16_t *out_value)
esp_err_t nvs_get_u16 (nvs_handle_t handle, const char *key, uint16_t *out_value)
esp_err_t nvs_get_i32 (nvs_handle_t handle, const char *key, int32_t *out_value)
esp_err_t nvs_get_u32 (nvs_handle_t handle, const char *key, uint32_t *out_value)
esp_err_t nvs_get_i64 (nvs_handle_t handle, const char *key, int64_t *out_value)
esp_err_t nvs_get_u64 (nvs_handle_t handle, const char *key, uint64_t *out_value)
esp_err_t nvs_get_str (nvs_handle_t handle, const char *key, char *out_value, size_t *length)

get value for given key

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type
doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, out_value is not modified.

All functions expect out_value to be a pointer to an already allocated variable of the given type.

nvs_get_str and nvs_get_blob functions support WinAPI-style length queries. To get the size necessary to store
the value, call nvs_get_str or nvs_get_blob with zero out_value and non-zero pointer to length. Variable pointed
to by length argument will be set to the required length. For nvs_get_str, this length includes the zero terminator.
When calling `nvs_get_str` and `nvs_get_blob` with non-zero `out_value`, length has to be non-zero and has to point to the length available in `out_value`. It is suggested that `nvs_get_str` is used for zero-terminated C strings, and `nvs_get/set_blob` used for arbitrary data structures.

```c
// Example (without error checking) of using nvs_get_str to get a string into a dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

Return

- ESP_OK if the value was retrieved successfully
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

Parameters

- `handle`: Handle obtained from `nvs_open` function.
- `key`: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn’t be empty.
- `out_value`: Pointer to the output value. May be NULL for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.
- `length`: A non-zero pointer to the variable holding the length of `out_value`. In case `out_value` is zero, will be set to the length required to hold the value. In case `out_value` is not zero, will be set to the actual length of the value written. For `nvs_get_str` this includes zero terminator.

```c
esp_err_t nvs_get_blob(nvs_handle_t handle, const char *key, void *out_value, size_t *length)
esp_err_t nvs_open(const char *name, nvs_open_mode_t open_mode, nvs_handle_t *out_handle)
```

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled “nvs” in the partition table.

Return

- ESP_OK if storage handle was opened successfully
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “nvs” is not found
- ESP_ERR_NVS_NOT_FOUND if namespace doesn’t exist yet and mode is `NVS_READONLY`
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
• other error codes from the underlying storage driver

Parameters

• name: Namespace name. Maximal length is determined by the underlying implementation, but is
guaranteed to be at least 15 characters. Shouldn’t be empty.

• open_mode: NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle
for reading only. All write requests will be rejected for this handle.

• out_handle: If successful (return code is zero), handle will be returned in this argument.

`esp_err_t nvs_open_from_partition(const char *part_name, const char *name, nvs_open_mode_t open_mode, nvs_handle_t *out_handle)`

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as nvs_open() API. However this API can operate on a specified NVS partition
instead of default NVS partition. Note that the specified partition must be registered with NVS using
nvs_flash_init_partition() API.

Return

• ESP_OK if storage handle was opened successfully

• ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized

• ESP_ERR_NVS_PART_NOT_FOUND if the partition with specified name is not found

• ESP_ERR_NVS_NOT_FOUND id namespace doesn’t exist yet and mode is NVS_READONLY

• ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints

• other error codes from the underlying storage driver

Parameters

• part_name: Label (name) of the partition of interest for object read/write/erase

• name: Namespace name. Maximal length is determined by the underlying implementation, but is
guaranteed to be at least 15 characters. Shouldn’t be empty.

• open_mode: NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle
for reading only. All write requests will be rejected for this handle.

• out_handle: If successful (return code is zero), handle will be returned in this argument.

`esp_err_t nvs_set_blob(nvs_handle_t handle, const char *key, const void *value, size_t length)`

set variable length binary value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until
nvs_commit function is called.

Return

• ESP_OK if value was set successfully

• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL

• ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only

• ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints

• ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to
save the value
• ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

• ESP_ERR_NVS_VALUE_TOO_LONG if the value is too long

Parameters

• handle: Handle obtained from nvs_open function. Handles that were opened read only cannot be used.

• key: Key name. Maximal length is 15 characters. Shouldn’t be empty.

• value: The value to set.

• length: length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

`esp_err_t nvs_erase_key(nvs_handle_t handle, const char *key)`
Erase key-value pair with given key name.
Note that actual storage may not be updated until nvs_commit function is called.

Return

• ESP_OK if erase operation was successful

• ESP.ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL

• ESP.ERR_NVS_READ_ONLY if handle was opened as read only

• ESP.ERR_NVS_NOT_FOUND if the requested key doesn’t exist

• other error codes from the underlying storage driver

Parameters

• handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

• key: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn’t be empty.

`esp_err_t nvs_erase_all(nvs_handle_t handle)`
Erase all key-value pairs in a namespace.
Note that actual storage may not be updated until nvs_commit function is called.

Return

• ESP_OK if erase operation was successful

• ESP.ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL

• ESP.ERR_NVS_READ_ONLY if handle was opened as read only

• other error codes from the underlying storage driver

Parameters

• handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.
**esp_err_t nvs_commit (nvs_handle_t handle)**

Write any pending changes to non-volatile storage.

After setting any values, nvs_commit() must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

**Return**

- ESP_OK if the changes have been written successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- other error codes from the underlying storage driver

**Parameters**

- **handle**: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

**void nvs_close (nvs_handle_t handle)**

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with nvs_open once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using nvs_commit function. Once this function is called on a handle, the handle should no longer be used.

**Parameters**

- **handle**: Storage handle to close

**esp_err_t nvs_get_stats (const char *part_name, nvs_stats_t *nvs_stats)**

Fill structure nvs_stats_t. It provides info about used memory the partition.

This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

```c
// Example of nvs_get_stats() to get the number of used entries and free entries:
nvs_stats_t nvs_stats;
void nvs_get_stats(esp_err_t handle)
void nvs_close (nvs_handle_t handle)

nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%d), FreeEntries = (%d), AllEntries = (%d)\n",
        nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.total_entries);
```

**Return**

- ESP_OK if the changes have been written successfully. Return param nvs_stats will be filled.
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “name” is not found. Return param nvs_stats will be filled 0.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param nvs_stats will be filled 0.
- ESP_ERR_INVALID_ARG if nvs_stats equal to NULL.
- ESP_ERR_INVALID_STATE if there is page with the status of INVALID. Return param nvs_stats will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first INVALID page.

**Parameters**

- **part_name**: Partition name NVS in the partition table. If pass a NULL than will use NVS_DEFAULT_PART_NAME (“nvs”).
• **nvs_stats**: Returns filled structure *nvs_states_t*. It provides info about used memory the partition.

\[ \text{esp_err_t} \text{nvs_get_used_entry_count}(\text{nvs_handle_t handle}, \text{size_t *used_entries}) \]

Calculate all entries in a namespace.

Note that to find out the total number of records occupied by the namespace, add one to the returned value used_entries (if err is equal to ESP_OK). Because the name space entry takes one entry.

// Example of nvs_get_used_entry_count() to get amount of all key-value pairs in one namespace:
\[ \text{nvs_handle_t handle;} \]
\[ \text{nvs_open("namespace1", NVS_READWRITE, &handle);} \]
\[ ... \]
\[ \text{size_t used_entries;} \]
\[ \text{size_t total_entries_namespace;} \]
\[ \text{if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){} } \]
\[ // the total number of records occupied by the namespace \]
\[ \text{total_entries_namespace = used_entries + 1;} \]

Return

• ESP_OK if the changes have been written successfully. Return param used_entries will be filled valid value.

• ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param used_entries will be filled 0.

• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL. Return param used_entries will be filled 0.

• ESP_ERR_INVALID_ARG if used_entries equal to NULL.

• Other error codes from the underlying storage driver. Return param used_entries will be filled 0.

Parameters

• handle: Handle obtained from nvs_open function.

• used_entries: Returns amount of used entries from a namespace.

\[ \text{nvs_iterator_t nvs_entry_find(const char *part_name, const char *namespace_name, nvs_type_t type)} \]

Create an iterator to enumerate NVS entries based on one or more parameters.

// Example of listing all the key-value pairs of any type under specified partition and namespace
\[ \text{nvs_iterator_t it = nvs_entry_find(partition, namespace, NVS_TYPE_ANY);} \]
\[ \text{while (it != NULL) { } } \]
\[ \text{nvs_entry_info_t info;} \]
\[ \text{nvs_entry_info(it, &info);} \]
\[ \text{it = nvs_entry_next(it);} \]
\[ \text{printf("key \'$s', type \'$d' \n", info.key, info.type);} \]

// Note: no need to release iterator obtained from nvs_entry_find function when
// nvs_entry_find or nvs_entry_next function return NULL, indicating no
// other
// element for specified criteria was found.
Return Iterator used to enumerate all the entries found, or NULL if no entry satisfying criteria was found. Iterator obtained through this function has to be released using `nvs_release_iterator` when not used anymore.

Parameters

- **part_name**: Partition name
- **namespace_name**: Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- **type**: One of `nvs_type_t` values.

`nvs_iterator_t nvs_entry_next (nvs_iterator_t iterator)`

Retuns next item matching the iterator criteria, NULL if no such item exists.

Note that any copies of the iterator will be invalid after this call.

Return NULL if no entry was found, valid `nvs_iterator_t` otherwise.

Parameters

- **iterator**: Iterator obtained from `nvs_entry_find` function. Must be non-NULL.

`void nvs_entry_info (nvs_iterator_t iterator, nvs_entry_info_t *out_info)`

Fills `nvs_entry_info_t` structure with information about entry pointed to by the iterator.

Parameters

- **iterator**: Iterator obtained from `nvs_entry_find` or `nvs_entry_next` function. Must be non-NULL.
- **out_info**: Structure to which entry information is copied.

`void nvs_release_iterator (nvs_iterator_t iterator)`

Release iterator.

Parameters

- **iterator**: Release iterator obtained from `nvs_entry_find` function. NULL argument is allowed.

Structures

`struct nvs_entry_info_t`

- Information about entry obtained from `nvs_entry_info` function

Public Members

- `char namespace_name[16]`
  - Namespace to which key-value belong
- `char key[16]`
  - Key of stored key-value pair
- `nvs_type_t type`
  - Type of stored key-value pair

`struct nvs_stats_t`

- Note Info about storage space NVS.
Public Members

size_t \texttt{used\_entries}
Amount of used entries.

size_t \texttt{free\_entries}
Amount of free entries.

size_t \texttt{total\_entries}
Amount all available entries.

size_t \texttt{namespace\_count}
Amount name space.

Macros

\texttt{ESP\_ERR\_NVS\_BASE}
Starting number of error codes

\texttt{ESP\_ERR\_NVS\_NOT\_INITIALIZED}
The storage driver is not initialized

\texttt{ESP\_ERR\_NVS\_NOT\_FOUND}
Id namespace doesn’t exist yet and mode is NVS\_READONLY

\texttt{ESP\_ERR\_NVS\_TYPE\_MISMATCH}
The type of set or get operation doesn’t match the type of value stored in NVS

\texttt{ESP\_ERR\_NVS\_READ\_ONLY}
Storage handle was opened as read only

\texttt{ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE}
There is not enough space in the underlying storage to save the value

\texttt{ESP\_ERR\_NVS\_INVALID\_NAME}
Namespace name doesn’t satisfy constraints

\texttt{ESP\_ERR\_NVS\_INVALID\_HANDLE}
Handle has been closed or is NULL

\texttt{ESP\_ERR\_NVS\_REMOVE\_FAILED}
The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

\texttt{ESP\_ERR\_NVS\_KEY\_TOO\_LONG}
Key name is too long

\texttt{ESP\_ERR\_NVS\_PAGE\_FULL}
Internal error; never returned by nvs API functions

\texttt{ESP\_ERR\_NVS\_INVALID\_STATE}
NVS is in an inconsistent state due to a previous error. Call nvs\_flash\_init and nvs\_open again, then retry.

\texttt{ESP\_ERR\_NVS\_INVALID\_LENGTH}
String or blob length is not sufficient to store data

\texttt{ESP\_ERR\_NVS\_NO\_FREE\_PAGES}
NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs\_flash\_init again.
ESP_ERR_NVS_VALUE_TOO_LONG
String or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND
Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND
NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED
XTS encryption failed while writing NVS entry

ESP_ERR_NVS_XTS_DECR_FAILED
XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED
XTS configuration setting failed

ESP_ERR_NVS_XTS_CFG_NOT_FOUND
XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED
NVS encryption is not supported in this version

ESP_ERR_NVS_KEYS_NOT_INITIALIZED
NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART
NVS key partition is corrupt

ESP_ERR_NVS_CONTENT_DIFFERS
Internal error; never returned by nvs API functions. NVS key is different in comparison

NVS_DEFAULT_PART_NAME
Default partition name of the NVS partition in the partition table

NVS_PART_NAME_MAX_SIZE
maximum length of partition name (excluding null terminator)

Type Definitions

typedef uint32_t nvs_handle_t
Opaque pointer type representing non-volatile storage handle

typedef nvs_handle_t nvs_handle

typedef nvs_open_mode_t nvs_open_mode

typedef struct nvs_opaque_iterator_t *nvs_iterator_t
Opaque pointer type representing iterator to nvs entries

Enumerations

enum nvs_open_mode_t
Mode of opening the non-volatile storage.

Values:

NVS_READONLY
Read only
NVS_READWRITE
Read and write

enum nvs_type_t
Types of variables.

Values:

NVS_TYPE_U8 = 0x01
Type uint8_t

NVS_TYPE_I8 = 0x11
Type int8_t

NVS_TYPE_U16 = 0x02
Type uint16_t

NVS_TYPE_I16 = 0x12
Type int16_t

NVS_TYPE_U32 = 0x04
Type uint32_t

NVS_TYPE_I32 = 0x14
Type int32_t

NVS_TYPE_U64 = 0x08
Type uint64_t

NVS_TYPE_I64 = 0x18
Type int64_t

NVS_TYPE_STR = 0x21
Type string

NVS_TYPE_BLOB = 0x42
Type blob

NVS_TYPE_ANY = 0xff
Must be last

2.6.4 NVS Partition Generator Utility

Introduction

The utility nvs_flash/nvs_partition_generator/nvs_partition_gen.py creates a binary file based on key-value pairs provided in a CSV file. The binary file is compatible with NVS architecture defined in Non-Volatile Storage. This utility is ideally suited for generating a binary blob, containing data specific to ODM/OEM, which can be flashed externally at the time of device manufacturing. This allows manufacturers to generate many instances of the same application firmware with customized parameters for each device, such as a serial number.

Prerequisites

To use this utility in encryption mode, install the following packages:

- cryptography package
All the required packages are included in requirements.txt in the root of the esp-idf directory.

**CSV file format**

Each line of a .csv file should contain 4 parameters, separated by a comma. The table below provides the description for each of these parameters.

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key</td>
<td>Key of the data. The data can be accessed later from an application using this key.</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Type</td>
<td>Supported values are file, data and namespace.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Encoding</td>
<td>Supported values are: u8, 18, u16, u32, i32, string, hex2bin, base64 and binary. This specifies how actual data values are encoded in the resulting binary file. The difference between the string and binary encoding is that string data is terminated with a NULL character, whereas binary data is not. As of now, for the file type, only hex2bin, base64, string, and binary encoding is supported.</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>Value</td>
<td>Data value. Encoding and Value cells for the namespace field type should be empty. Encoding and Value of namespace is fixed and is not configurable. Any values in these cells are ignored.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** The first line of the CSV file should always be the column header and it is not configurable.

Below is an example dump of such a CSV file:

```plaintext
key,type,encoding,value       <-- column header
namespace_name,namespace,,    <-- First entry should be of type "namespace"
key1,data,u8,1
key2,file,string,/path/to/file
```

**Note:**

Make sure there are no spaces:
- before and after ‘,’
- at the end of each line in a CSV file

---

**NVS Entry and Namespace association**

When a namespace entry is encountered in a CSV file, each following entry will be treated as part of that namespace until the next namespace entry is found. At this point, all the following entries will be treated as part of the new namespace.
Note: First entry in a CSV file should always be a namespace entry.

Multipage Blob Support

By default, binary blobs are allowed to span over multiple pages and are written in the format mentioned in Section Structure of entry. If you intend to use an older format, the utility provides an option to disable this feature.

Encryption Support

The NVS Partition Generator utility also allows you to create an encrypted binary file. The utility uses the AES-XTS encryption. Please refer to NVS Encryption for more details.

Decryption Support

This utility allows you to decrypt an encrypted NVS binary file. The utility uses an NVS binary file encrypted using AES-XTS encryption. Please refer to NVS Encryption for more details.

Running the utility

Usage:

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

Optional Arguments:

```
<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>

Commands:

```
Run nvs_partition_gen.py {command} -h for additional help
```

```
<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>

(continues on next page)
To generate NVS partition (Default):

Usage:

```
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR] input output size
```

Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to CSV file to parse</td>
</tr>
<tr>
<td>output</td>
<td>Path to output NVS binary file</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td>--version {1,2}</td>
<td>Set multipage blob version.</td>
</tr>
</tbody>
</table>

| | Version 1 - Multipage blob support disabled. |
| | Version 2 - Multipage blob support enabled. |

Default: Version 2
You can run the utility to generate NVS partition using the command below: A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

**To generate only encryption keys:**

**Usage:**

```
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

Optional Arguments:

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output director to store files created.</td>
</tr>
</tbody>
</table>
```

You can run the utility to generate only encryption keys using the command below:

```
python nvs_partition_gen.py generate-key
```

**To generate encrypted NVS partition:**

**Usage:**

```
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen] [--keyfile KEYFILE] [--inputkey INPUTKEY] [--outdir OUTDIR]
```

(continues on next page)
## Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to CSV file to parse</td>
</tr>
<tr>
<td>output</td>
<td>Path to output NVS binary file</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

## Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>Show this help message and exit</td>
</tr>
<tr>
<td>--version {1,2}</td>
<td>Set multipage blob version.</td>
</tr>
<tr>
<td></td>
<td>Version 1 - Multipage blob support disabled.</td>
</tr>
<tr>
<td></td>
<td>Version 2 - Multipage blob support enabled.</td>
</tr>
<tr>
<td></td>
<td>Default: Version 2</td>
</tr>
<tr>
<td>--keygen</td>
<td>Generates key for encrypting NVS partition</td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td>--inputkey INPUTKEY</td>
<td>File having key for encrypting NVS partition</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created</td>
</tr>
</tbody>
</table>
You can run the utility to encrypt NVS partition using the command below: A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

  ```bash
  python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
  -0x3000 --keygen
  ```

  **Note:** Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created.

- Encrypt by allowing the utility to generate encryption keys and store it in provided custom filename:

  ```bash
  python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
  -0x3000 --keygen --keyfile sample_keys.bin
  ```

  **Note:** Encryption key of the following format `<outdir>/keys/sample_keys.bin` is created.

**Note:** This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to `NVS key partition` for more details.

- Encrypt by providing the encryption keys as input binary file:

  ```bash
  python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
  -0x3000 --inputkey sample_keys.bin
  ```

**To decrypt encrypted NVS partition:**

**Usage:**

```bash
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key output
```

Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to encrypted NVS partition file to parse</td>
</tr>
<tr>
<td>key</td>
<td>Path to file having keys for decryption</td>
</tr>
<tr>
<td>output</td>
<td>Path to output decrypted binary file</td>
</tr>
</tbody>
</table>

(continues on next page)
Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to decrypt encrypted NVS partition using the command below:

```bash
code python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

You can also provide the format version number:

- Multipage Blob Support Disabled (Version 1)
- Multipage Blob Support Enabled (Version 2)

**Multipage Blob Support Disabled (Version 1):**

You can run the utility in this format by setting the version parameter to 1, as shown below. A sample CSV file is provided with the utility:

```bash
code python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 --version 1
```

**Multipage Blob Support Enabled (Version 2):**

You can run the utility in this format by setting the version parameter to 2, as shown below. A sample CSV file is provided with the utility:

```bash
code python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --version 2
```

**Note:** Minimum NVS Partition Size needed is 0x3000 bytes.

**Note:** When flashing the binary onto the device, make sure it is consistent with the application’s sdkconfig.
Caveats

- Utility does not check for duplicate keys and will write data pertaining to both keys. You need to make sure that the keys are distinct.
- Once a new page is created, no data will be written in the space left on the previous page. Fields in the CSV file need to be ordered in such a way as to optimize memory.
- 64-bit datatype is not yet supported.

2.6.5 SD/SDIO/MMC Driver

[[]]

Overview

The SD/SDIO/MMC driver currently supports SD memory, SDIO cards, and eMMC chips. This is a protocol level driver built on top of SDMMC and SD SPI host drivers.

SDMMC and SD SPI host drivers (driver/include/driver/sdmmc_host.h) provide API functions for:

- Sending commands to slave devices
- Sending and receiving data
- Handling error conditions within the bus

For functions used to initialize and configure:

- SDMMC host, see SDMMC Host API
- SD SPI host, see SD SPI Host API

The SDMMC protocol layer described in this document handles the specifics of the SD protocol, such as the card initialization and data transfer commands.

The protocol layer works with the host via the sdmmc_host_t structure. This structure contains pointers to various functions of the host.

Application Example

An example which combines the SDMMC driver with the FATFS library is provided in the storage/sd_card directory of ESP-IDF examples. This example initializes the card, then writes and reads data from it using POSIX and C library APIs. See README.md file in the example directory for more information.

Protocol layer API

The protocol layer is given the sdmmc_host_t structure. This structure describes the SD/MMC host driver, lists its capabilities, and provides pointers to functions of the driver. The protocol layer stores card-specific information in the sdmmc_card_t structure. When sending commands to the SD/MMC host driver, the protocol layer uses the sdmmc_command_t structure to describe the command, arguments, expected return values, and data to transfer if there is any.
Using API with SD memory cards

1. To initialize the host, call the host driver functions, e.g., `sdmmc_host_init()`, `sdmmc_host_init_slot()`.
2. To initialize the card, call `sdmmc_card_init()` and pass to it the parameters `host` - the host driver information, and `card` - a pointer to the structure `sdmmc_card_t` which will be filled with information about the card when the function completes.
3. To read and write sectors of the card, use `sdmmc_read_sectors()` and `sdmmc_write_sectors()` respectively and pass to it the parameter `card` - a pointer to the card information structure.
4. If the card is not used anymore, call the host driver function - e.g., `sdmmc_host_deinit()` - to disable the host peripheral and free the resources allocated by the driver.

Using API with eMMC chips

From the protocol layer’s perspective, eMMC memory chips behave exactly like SD memory cards. Even though eMMCs are chips and do not have a card form factor, the terminology for SD cards can still be applied to eMMC due to the similarity of the protocol (`sdmmc_card_t`, `sdmmc_card_init`). Note that eMMC chips cannot be used over SPI, which makes them incompatible with the SD SPI host driver.

To initialize eMMC memory and perform read/write operations, follow the steps listed for SD cards in the previous section.

Using API with SDIO cards

Initialization and the probing process is the same as with SD memory cards. The only difference is in data transfer commands in SDIO mode.

During the card initialization and probing, performed with `sdmmc_card_init()`, the driver only configures the following registers of the IO card:

1. The IO portion of the card is reset by setting RES bit in the I/O Abort (0x06) register.
2. If 4-line mode is enabled in host and slot configuration, the driver attempts to set the Bus width field in the Bus Interface Control (0x07) register. If setting the filed is successful, which means that the slave supports 4-line mode, the host is also switched to 4-line mode.
3. If high-speed mode is enabled in the host configuration, the SHS bit is set in the High Speed (0x13) register.

In particular, the driver does not set any bits in (1) I/O Enable and Int Enable registers, (2) I/O block sizes, etc. Applications can set them by calling `sdmmc_io_write_byte()`.

For card configuration and data transfer, choose the pair of functions relevant to your case from the table below.

<table>
<thead>
<tr>
<th>Action</th>
<th>Read Function</th>
<th>Write Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read and write a single byte using IO_RW_DIRECT (CMD52)</td>
<td><code>sdmmc_io_read_byte()</code></td>
<td><code>sdmmc_io_write_byte()</code></td>
</tr>
<tr>
<td>Read and write multiple bytes using IO_RW_EXTENDED (CMD53) in byte mode</td>
<td><code>sdmmc_io_read_bytes()</code></td>

</table>

SDIO interrupts can be enabled by the application using the function `sdmmc_io_enable_int()`. When using SDIO in 1-line mode, the D1 line also needs to be connected to use SDIO interrupts.
If you want the application to wait until the SDIO interrupt occurs, use `sdmmc_io_wait_int()`.

There is a component ESSL (ESP Serial Slave Link) to use if you are communicating with an ESP32 SDIO slave. See [ESP Serial Slave Link](https://docs.espressif.com/projects/esp-idf/en/latest/esp32/api-reference/peripherals/sdio.html) and example peripherals/sdio/host.

### Combo (memory + IO) cards

The driver does not support SD combo cards. Combo cards are treated as IO cards.

### Thread safety

Most applications need to use the protocol layer only in one task. For this reason, the protocol layer does not implement any kind of locking on the `sdmmc_card_t` structure, or when accessing SDMMC or SD SPI host drivers. Such locking is usually implemented on a higher layer, e.g., in the filesystem driver.

### API Reference

#### Header File

- sdmmc/include/sdmmc_cmd.h

#### Functions

**esp_err_t sdmmc_card_init(const sdmmc_host_t *host, sdmmc_card_t *out_card)**

Probe and initialize SD/MMC card using given host

**Note** Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

**Return**

- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**

- host: pointer to structure defining host controller
- out_card: pointer to structure which will receive information about the card when the function completes

**void sdmmc_card_print_info(FILE *stream, const sdmmc_card_t *card)**

Print information about the card to a stream.

**Parameters**

- stream: stream obtained using fopen or fdopen
- card: card information structure initialized using sdmmc_card_init

**esp_err_t sdmmc_write_sectors(sdmmc_card_t *card, const void *src, size_t start_sector, size_t sector_count)**

Write given number of sectors to SD/MMC card
Return
• ESP_OK on success
• One of the error codes from SDMMC host controller

Parameters
• card: pointer to card information structure previously initialized using sdmmc_card_init
• src: pointer to data buffer to read data from; data size must be equal to sector_count * card->csd.sector_size
• start_sector: sector where to start writing
• sector_count: number of sectors to write

```
esp_err_t sdmmc_read_sectors (sdmmc_card_t *card, void *dst, size_t start_sector, size_t sector_count)
```
Write given number of sectors to SD/MMC card

Return
• ESP_OK on success
• One of the error codes from SDMMC host controller

Parameters
• card: pointer to card information structure previously initialized using sdmmc_card_init
• dst: pointer to data buffer to write into; buffer size must be at least sector_count * card->csd.sector_size
• start_sector: sector where to start reading
• sector_count: number of sectors to read

```
esp_err_t sdmmc_io_read_byte (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t *out_byte)
```
Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

Return
• ESP_OK on success
• One of the error codes from SDMMC host controller

Parameters
• card: pointer to card information structure previously initialized using sdmmc_card_init
• function: IO function number
• reg: byte address within IO function
• out_byte: output, receives the value read from the card

```
esp_err_t sdmmc_io_write_byte (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)
```
Write one byte to an SDIO card using IO_RW_DIRECT (CMD52)

Return
• ESP_OK on success
• One of the error codes from SDMMC host controller
Parameters

- **card**: pointer to card information structure previously initialized using sdmmc_card_init
- **function**: IO function number
- **reg**: byte address within IO function
- **in_byte**: value to be written
- **out_byte**: if not NULL, receives new byte value read from the card (read-after-write).

```c
esp_err_t sdmmc_io_read_bytes (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)
```

Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see sdmmc_io_read_blocks.

Return

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

Parameters

- **card**: pointer to card information structure previously initialized using sdmmc_card_init
- **function**: IO function number
- **addr**: byte address within IO function where reading starts
- **dst**: buffer which receives the data read from card
- **size**: number of bytes to read

```c
esp_err_t sdmmc_io_write_bytes (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```

Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see sdmmc_io_write_blocks.

Return

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

Parameters

- **card**: pointer to card information structure previously initialized using sdmmc_card_init
- **function**: IO function number
- **addr**: byte address within IO function where writing starts
- **src**: data to be written
- **size**: number of bytes to write
esp_err_t sdmmc_io_read_blocks (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)

Read blocks of data from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see sdmmc_io_read_bytes.

Return

• ESP_OK on success
• ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
• One of the error codes from SDMMC host controller

Parameters

• card: pointer to card information structure previously initialized using sdmmc_card_init
• function: IO function number
• addr: byte address within IO function where writing starts
• dst: buffer which receives the data read from card
• size: number of bytes to read, must be divisible by the card block size.

esp_err_t sdmmc_io_write_blocks (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)

Write blocks of data to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see sdmmc_io_write_bytes.

Return

• ESP_OK on success
• ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
• One of the error codes from SDMMC host controller

Parameters

• card: pointer to card information structure previously initialized using sdmmc_card_init
• function: IO function number
• addr: byte address within IO function where writing starts
• src: data to be written
• size: number of bytes to read, must be divisible by the card block size.

esp_err_t sdmmc_io_enable_int (sdmmc_card_t *card)

Enable SDIO interrupt in the SDMMC host

Return

• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

Parameters

• card: pointer to card information structure previously initialized using sdmmc_card_init
esp_err_t sdmmc_io_wait_int (sdmmc_card_t *card, TickType_t timeout_ticks)
Block until an SDIO interrupt is received
Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

Return
• ESP_OK if the interrupt is received
• ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
• ESP_ERR_TIMEOUT if the interrupt does not happen in timeout_ticks

Parameters
• card: pointer to card information structure previously initialized using sdmmc_card_init
• timeout_ticks: time to wait for the interrupt, in RTOS ticks

esp_err_t sdmmc_io_get_cis_data (sdmmc_card_t *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)
Get the data of CIS region of a SDIO card.
You may provide a buffer not sufficient to store all the CIS data. In this case, this functions store as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

Return
• ESP_OK: on success
• ESP_ERR_INVALID_RESPONSE: if the card does not (correctly) support CIS.
• ESP_ERR_INVALID_SIZE: CIS_CODE_END found, but buffer_size is less than required size, which is stored in the inout_cis_size then.
• ESP_ERR_NOT_FOUND: if the CIS_CODE_END not found. Increase input value of inout_cis_size or set it to 0, if you still want to search for the end; output value of inout_cis_size is invalid in this case.
• and other error code return from sdmmc_io_read_bytes

Parameters
• card: pointer to card information structure previously initialized using sdmmc_card_init
• out_buffer: Output buffer of the CIS data
• buffer_size: Size of the buffer.
• inout_cis_size: Mandatory, pointer to a size, input and output.
  – input: Limitation of maximum searching range, should be 0 or larger than buffer_size. The function searches for CIS_CODE_END until this range. Set to 0 to search infinitely.
  – output: The size required to store all the CIS data, if CIS_CODE_END is found.

esp_err_t sdmmc_io_print_cis_info (uint8_t *buffer, size_t buffer_size, FILE *fp)
Parse and print the CIS information of a SDIO card.

Note Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in sdmmc_io.c and contribute to the IDF through the Github repository.
Return

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: if the value from the card is not supported to be parsed.
- ESP_ERR_INVALID_SIZE: if the CIS size fields are not correct.

Parameters

- buffer: Buffer to parse
- buffer_size: Size of the buffer.
- fp: File pointer to print to, set to NULL to print to stdout.

Header File

- driver/include/driver/sdmmc_types.h

Structures

**struct sdmmc_csd_t**
Decoded values from SD card Card Specific Data register

**Public Members**

- **int csd_ver**
  CSD structure format
- **int mmc_ver**
  MMC version (for CID format)
- **int capacity**
  total number of sectors
- **int sector_size**
  sector size in bytes
- **int read_block_len**
  block length for reads
- **int card_command_class**
  Card Command Class for SD
- **int tr_speed**
  Max transfer speed

**struct sdmmc_cid_t**
Decoded values from SD card Card IDentification register

**Public Members**

- **int mfg_id**
  manufacturer identification number
- **int oem_id**
  OEM/product identification number
char name[8]
    product name (MMC v1 has the longest)

int revision
    product revision

int serial
    product serial number

int date
    manufacturing date

**struct sdmmc_scr_t**
Decoded values from SD Configuration Register

**Public Members**

int sd_spec
    SD Physical layer specification version, reported by card

int bus_width
    bus widths supported by card: BIT(0) — 1-bit bus, BIT(2) — 4-bit bus

**struct sdmmc_ext_csd_t**
Decoded values of Extended Card Specific Data

**Public Members**

uint8_t power_class
    Power class used by the card

**struct sdmmc_switch_func_rsp_t**
SD SWITCH_FUNC response buffer

**Public Members**

uint32_t data[512 / 8 / sizeof(uint32_t)]
    response data

**struct sdmmc_command_t**
SD/MMC command information

**Public Members**

uint32_t opcode
    SD or MMC command index

uint32_t arg
    SD/MMC command argument

sdmmc_response_t response
    response buffer

void *data
    buffer to send or read into

2.6. Storage API
size_t datalen
   length of data buffer

size_t blklen
   block length

int flags
   see below

esp_err_t error
   error returned from transfer

int timeout_ms
   response timeout, in milliseconds

struct sdmmc_host_t
   SD/MMC Host description

   This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

Public Members

uint32_t flags
   flags defining host properties

int slot
   slot number, to be passed to host functions

int max_freq_khz
   max frequency supported by the host

float io_voltage
   I/O voltage used by the controller (voltage switching is not supported)

esp_err_t (*init)(void)
   Host function to initialize the driver

esp_err_t (*set_bus_width)(int slot, size_t width)
   host function to set bus width

size_t (*get_bus_width)(int slot)
   host function to get bus width

esp_err_t (*set_bus_ddr_mode)(int slot, bool ddr_enable)
   host function to set DDR mode

esp_err_t (*set_card_clk)(int slot, uint32_t freq_khz)
   host function to set card clock frequency

esp_err_t (*do_transaction)(int slot, sdmmc_command_t *cmdinfo)
   host function to do a transaction

esp_err_t (*deinit)(void)
   host function to deinitialize the driver

esp_err_t (*io_int_enable)(int slot)
   Host function to enable SDIO interrupt line

esp_err_t (*io_int_wait)(int slot, TickType_t timeout_ticks)
   Host function to wait for SDIO interrupt line to be active
int command_timeout_ms
timeout, in milliseconds, of a single command. Set to 0 to use the default value.

struct sdmmc_card_t
SD/MMC card information structure

Public Members

sdmmc_host_t host
Host with which the card is associated

uint32_t ocr
OCR (Operation Conditions Register) value

sdmmc_cid_t cid
decoded CID (Card IDentification) register value

sdmmc_response_t raw_cid
raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

sdmmc_csd_t csd
decoded CSD (Card-Specific Data) register value

sdmmc_scr_t scr
decoded SCR (SD card Configuration Register) value

sdmmc_ext_csd_t ext_csd
decoded EXT_CSD (Extended Card Specific Data) register value

uint16_t rca
RCA (Relative Card Address)

uint16_t max_freq_khz
Maximum frequency, in kHz, supported by the card

uint32_t is_mem
Bit indicates if the card is a memory card

uint32_t is_sdio
Bit indicates if the card is an IO card

uint32_t ismmc
Bit indicates if the card is MMC

uint32_t num_io_functions
If is_sdio is 1, contains the number of IO functions on the card

uint32_t log_bus_width
\log_2(\text{bus width supported by card})

uint32_t is_ddr
Card supports DDR mode

uint32_t reserved
Reserved for future expansion

Macros

SDMMC_HOST_FLAG_1BIT
host supports 1-line SD and MMC protocol

2.6. Storage API
**SDMMC_HOST_FLAG_4BIT**

host supports 4-line SD and MMC protocol

**SDMMC_HOST_FLAG_8BIT**

host supports 8-line MMC protocol

**SDMMC_HOST_FLAG_SPI**

host supports SPI protocol

**SDMMC_HOST_FLAG_DDR**

host supports DDR mode for SD/MMC

**SDMMC_FREQ_DEFAULT**

SD/MMC Default speed (limited by clock divider)

**SDMMC_FREQ_HIGHSPEED**

SD High speed (limited by clock divider)

**SDMMC_FREQ_PROBING**

SD/MMC probing speed

**SDMMC_FREQ_52M**

MMC 52MHz speed

**SDMMC_FREQ_26M**

MMC 26MHz speed

### Type Definitions

```c
typedef uint32_t sdmmc_response_t[4]
    SD/MMC command response buffer
```

### 2.6.6 SPI Flash API

[]

#### Overview

The spi_flash component contains API functions related to reading, writing, erasing, memory mapping for data in the external flash. The spi_flash component also has higher-level API functions which work with partitions defined in the partition table.

Different from the API before IDF v4.0, the functionality is not limited to the “main” SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access to external flashes chips on not only SPI0/1 but also HSPI/VSPI buses.

**Note:** Flash APIs after IDF v4.0 are no longer atomic. A writing operation during another on-going read operation, on the overlapped flash address, may cause the return data from the read operation to be partly same as before, and partly updated as new written.

Kconfig option `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` can be used to switch `spi_flash_*` functions back to the implementation before IDF v4.0. However, the code size may get bigger if you use the new API and the old API the same time.
Encrypted reads and writes use the old implementation, even if `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` is not enabled. As such, encrypted flash operations are only supported with the main flash chip (and not with other flash chips on SPI1 with different CS).

**Initializing a flash device**

To use `esp_flash_*` APIs, you need to have a chip initialized on a certain SPI bus.

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This function initializes the resources (I/O, DMA, interrupts) shared among devices attached to this bus.

2. Call `spi_bus_add_flash_device()` to attach the flash device onto the bus. This allocates memory, and fill the members for the `esp_flash_t` structure. The CS I/O is also initialized here.

3. Call `esp_flash_init()` to actually communicate with the chip. This will also detect the chip type, and influence the following operations.

**Note:** Multiple flash chips can be attached to the same bus now. However, using `esp_flash_*` devices and `spi_device_*` devices on the same SPI bus is not supported yet.

**SPI flash access API**

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp_flash_erase_chip()` erases the whole flash
- `esp_flash_get_chip_size()` returns flash chip size, in bytes, as configured in menuconfig

Generally, try to avoid using the raw SPI flash functions to the “main” SPI flash chip in favour of partition-specific functions.

**SPI Flash Size**

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000.

By default, the SPI flash size is detected by esptool.py when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

**Concurrency Constraints for flash on SPI1**

Because the SPI1 flash is also used for firmware execution via the instruction & data caches, these caches must be disabled while reading/writing/erasing. This means that both CPUs must be running code from IRAM and must only be reading data from DRAM while flash write operations occur.
If you use the API functions documented here, then these constraints are applied automatically and transparently. However, note that it will have some performance impact on other tasks in the system.

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between IRAM, DRAM, and flash cache, please refer to the application memory layout documentation.

To avoid reading flash cache accidentally, when one CPU initiates a flash write or erase operation, the other CPU is put into a blocked state, and all non-IRAM-safe interrupts are disabled on both CPUs until the flash operation completes.

If one CPU initiates a flash write or erase operation, the other CPU is put into a blocked state to avoid reading flash cache accidentally. All interrupts not safe for IRAM are disabled on both CPUs until the flash operation completes.

**IRAM-Safe Interrupt Handlers**

If you have an interrupt handler that you want to execute while a flash operation is in progress (for example, for low latency operations), set the ESP_INTR_FLAG_IRAM flag when the interrupt handler is registered.

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM.

Use the IRAM_ATTR attribute for functions:

```c
#include "esp_attr.h"

void IRAM_ATTR gpio_isr_handler(void* arg)
{
    // ...
}
```

Use the DRAM_ATTR and DRAM_STR attributes for constant data:

```c
void IRAM_ATTR gpio_isr_handler(void* arg)
{
    const static DRAM_ATTR uint8_t INDEX_DATA[] = { 45, 33, 12, 0 };  
    const static char *MSG = DRAM_STR("I am a string stored in RAM");
}
```

Note that knowing which data should be marked with DRAM_ATTR can be hard, the compiler will sometimes recognize that a variable or expression is constant (even if it is not marked const) and optimize it into flash, unless it is marked with DRAM_ATTR.

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

**Partition table API**

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information on partition tables can be found here.

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in esp_partition.h:

- `esp_partition_find()` checks a partition table for entries with specific type, returns an opaque iterator.
- `esp_partition_get()` returns a structure describing the partition for a given iterator.
- `esp_partition_next()` shifts the iterator to the next found partition.
• `esp_partition_iterator_release()` releases iterator returned by `esp_partition_find`.

• `esp_partition_find_first()` - a convenience function which returns the structure describing the first partition found by `esp_partition_find`.

• `esp_partition_read()`, `esp_partition_write()`, `esp_partition_erase_range()` are equivalent to `spi_flash_read()`, `spi_flash_write()`, `spi_flash_erase_range()`, but operate within partition boundaries.

Note: Application code should mostly use these `esp_partition_*` API functions instead of lower level `spi_flash_*` API functions. Partition table API functions do bounds checking and calculate correct offsets in flash, based on data stored in a partition table.

### SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the *Flash Encryption documentation* for more details.

### Memory mapping API

ESP32 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64KB pages. Memory mapping hardware can map up to four megabytes of flash into data address space and up to 16 megabytes of flash into instruction address space. See the technical reference manual for more details about memory mapping hardware.

Note that some 64KB pages are used to map the application itself into memory, so the actual number of available 64KB pages may be less.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when *flash encryption* is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in `esp_spi_flash.h` and `esp_partition.h`:

• `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.

• `spi_flash_munmap()` unmaps previously mapped region.

• `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

• `spi_flash_mmap()` must be given a 64KB aligned physical address.

• `esp_partition_mmap()` may be given any arbitrary offset within the partition, it will adjust the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in 64KB blocks, it may be possible to read data outside of the partition provided to `esp_partition_mmap`. 
Implementation

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provides support of some OS functions (e.g. lock, delay) in different stages (1st/2st boot, or the app).

Host driver

The host driver relies on an interface (`spi_flash_host_driver_t`) defined in the `spi_flash_host_drv.h` (in the `soc/include/hal` folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32 memory-spi functionalities. However due to the speed limitations of ESP32, the HAL layer can’t provide high-speed implementations to some reading commands (So we didn’t do it at all). The files (`memspi_host_driver.h` and `.c`) implement the high-speed version of these commands with the `common_command` function provided in the HAL, and wrap these functions as `spi_flash_host_driver_t` for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the `spi_flash_host_driver_t` are implemented, the esp_flash API can access to the flash regardless of the low-level hardware.

Chip driver

The chip driver, defined in `spi_flash_chip_driver.h`, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status after. Some chips need different command or value, or need special communication ways.

There is a type of chip called generic chip which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

OS functions

Currently the OS function layer provides a lock and a delay entries.

The lock is used to resolve the conflicts between the SPI chip access and other functions. E.g. the cache (used for the code and PSRAM data fetch) should be disabled when the flash chip on the SPI0/1 is being accessed. Also, some devices which don’t have CS wire, or the wire is controlled by the software (e.g. SD card via SPI interface), requires the bus to be monopolized during a period.

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.
See also

- *Partition Table documentation*
- *Over The Air Update (OTA) API* provides high-level API for updating app firmware stored in flash.
- *Non-Volatile Storage (NVS) API* provides a structured API for storing small pieces of data in SPI flash.

Implementation details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation: - In a single-core setup, the SDK does it by disabling interrupts/scheduler before performing the flash operation. - In a dual-core setup, this is slightly more complicated as the SDK needs to make sure that the other CPU is not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (`CONFIG_FREERTOS_UNICORE` enabled), you need to disable both caches, so that no inter-CPU communication can take place.

API Reference - SPI Flash

Header File

- `spi_flash/include/esp_flash_spi_init.h`

Functions

```c
esp_err_t spi_bus_add_flash_device(esp_flash_t **out_chip, const esp_flash_spi_device_config_t *config)
```

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

Return

- ESP_ERR_INVALID_ARG: `out_chip` is NULL, or some field in the config is invalid.
- ESP_ERR_NO_MEM: failed to allocate memory for the chip structures.
- ESP_OK: success.

Parameters
• out_chip: Pointer to hold the initialized chip.
• config: Configuration of the chips to initialize.

`esp_err_t spi_bus_remove_flash_device(esp_flash_t *chip)`
Remove a SPI Flash device from the SPI bus.

Return

• ESP_ERR_INVALID_ARG: The chip is invalid.
• ESP_OK: success.

Parameters

• chip: The flash device to remove.

Structures

`struct esp_flash_spi_device_config_t`
Configurations for the SPI Flash to init.

Public Members

`spi_host_device_t host_id`
Bus to use.

int cs_id
CS pin (signal) to use.

int cs_io_num
GPIO pin to output the CS signal.

`esp_flash_io_mode_t io_mode`
IO mode to read from the Flash.

`esp_flash_speed_t speed`
Speed of the Flash clock.

int input_delay_ns
Input delay of the data pins, in ns. Set to 0 if unknown.

Header File

• spi_flash/include/esp_flash.h

Functions

`esp_err_t esp_flash_init (esp_flash_t *chip)`
Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

Note Only the host and read_mode fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.
Note If the chip->drv pointer is NULL, chip chip_drv will be auto-detected based on its manufacturer & product IDs. See esp_flash_registered_flash_drivers pointer for details of this process.

Return ESP_OK on success, or a flash error code if initialisation fails.

Parameters

- chip: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

bool esp_flash_chip_driver_initialized(const esp_flash_t *chip)

Check if appropriate chip driver is set.

Return true if set, otherwise false.

Parameters

- chip: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

esp_err_t esp.flash_read_id(esp_flash_t *chip, uint32_t *out_id)

Read flash ID via the common “RDID” SPI flash command.

ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.

Parameters

- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- out_id: Pointer to receive ID value.

Return ESP_OK on success, or a flash error code if operation failed.

esp_err_t esp_flash_get_size(esp_flash_t *chip, uint32_t *out_size)

Detect flash size based on flash ID.

Note Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

Return ESP_OK on success, or a flash error code if operation failed.

Parameters

- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- out_size: Detected size in bytes.

esp_err_t esp_flash_erase_chip(esp_flash_t *chip)

Erase flash chip contents.

Return ESP_OK on success, or a flash error code if operation failed.

Parameters

- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()

esp_err_t esp.flash_erase_region(esp_flash_t *chip, uint32_t start, uint32_t len)

Erase a region of the flash chip.

Sector size is specified in chip->drv->sector_size field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

Parameters

- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• **start**: Address to start erasing flash. Must be sector aligned.
• **len**: Length of region to erase. Must also be sector aligned.

Erase is performed using block (multi-sector) erases where possible (block size is specified in chip->drv->block_erase_size field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

**Return** ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_get_chip_write_protect (esp_flash_t *chip, bool *write_protected)
```
Read if the entire chip is write protected.

**Note** A correct result for this flag depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Return** ESP_OK on success, or a flash error code if operation failed.

**Parameters**

• **chip**: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• **write_protected**: Pointer to boolean, set to the value of the write protect flag.

```c
esp_err_t esp_flash_set_chip_write_protect (esp_flash_t *chip, bool write_protect)
```
Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

**Note** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Parameters**

• **chip**: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• **write_protect**: Boolean value for the write protect flag

**Return** ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_get_protectable_regions (const esp_flash_t *chip, const esp_flash_region_t **out_regions, uint32_t *out_num_regions)
```
Read the list of individually protectable regions of this SPI flash chip.

**Note** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Return** ESP_OK on success, or a flash error code if operation failed.

**Parameters**

• **chip**: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• **out_regions**: Pointer to receive a pointer to the array of protectable regions of the chip.
• **out_num_regions**: Pointer to an integer receiving the count of protectable regions in the array returned in ‘regions’.
esp_err_t esp_flash_get_protected_region(esp_flash_t *chip, const esp_flash_region_t *region, bool *out_protected)

Detect if a region of the SPI flash chip is protected.

**Note** It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

**Note** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Return** ESP_OK on success, or a flash error code if operation failed.

**Parameters**
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- region: Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(…).
- out_protected: Pointer to a flag which is set based on the protected status for this region.

esp_err_t esp_flash_set_protected_region(esp_flash_t *chip, const esp_flash_region_t *region, bool protect)

Update the protected status for a region of the SPI flash chip.

**Note** It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

**Note** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Return** ESP_OK on success, or a flash error code if operation failed.

**Parameters**
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- region: Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(…).
- protect: Write protection flag to set.

esp_err_t esp_flash_read(esp_flash_t *chip, void *buffer, uint32_t address, uint32_t length)

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- buffer: Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- address: Address on flash to read from. Must be less than chip->size field.
- length: Length (in bytes) of data to read.

**Note** If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

**Return**
- ESP_OK: success
• ESP_ERR_NO_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
• or a flash error code if operation failed.

`esp_err_t esp_flash_write(esp_flash_t *chip, const void *buffer, uint32_t address, uint32_t length)`
Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**
- `chip`: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- `address`: Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- `buffer`: Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- `length`: Length (in bytes) of data to write.

**Return** ESP_OK on success, or a flash error code if operation failed.

`esp_err_t esp_flash_write_encrypted(esp_flash_t *chip, uint32_t address, const void *buffer, uint32_t length)`
Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

**Note** Both address & length must be 16 byte aligned, as this is the encryption block size

**Return**
- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.
- or other flash error code from spi_flash_write_encrypted().

**Parameters**
- `chip`: Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- `address`: Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- `buffer`: Pointer to a buffer with the data to write.
- `length`: Length (in bytes) of data to write. 16 byte aligned.

`esp_err_t esp_flash_read_encrypted(esp_flash_t *chip, uint32_t address, void *out_buffer, uint32_t length)`
Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

**Return**
- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.
- or other flash error code from spi_flash_read_encrypted().

**Parameters**
• chip: Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
• address: Address on flash to read from.
• out_buffer: Pointer to a buffer for the data to read to.
• length: Length (in bytes) of data to read.

```c
static bool esp_flash_is_quad_mode(const esp_flash_t *chip)
```

Returns true if chip is configured for Quad I/O or Quad Fast Read.

**Return**  true if flash works in quad mode, otherwise false

**Parameters**

• chip: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

**Structures**

```c
struct esp_flash_region_t
```

Structure for describing a region of flash.

**Public Members**

- **uint32_t offset**
  
  Start address of this region.

- **uint32_t size**
  
  Size of the region.

```c
struct esp_flash_os_functions_t
```

OS-level integration hooks for accessing flash chips inside a running OS

**Public Members**

- **esp_err_t (*start)(void *arg)**
  
  Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to ‘end’).

- **esp_err_t (*end)(void *arg)**
  
  Called after completing any flash operation.

- **esp_err_t (*region_protected)(void *arg, size_t start_addr, size_t size)**
  
  Called before any erase/write operations to check whether the region is limited by the OS

- **esp_err_t (*delay_ms)(void *arg, unsigned ms)**
  
  Delay for at least ‘ms’ milliseconds. Called in between ‘start’ and ‘end’.

```c
struct esp_flash_t
```

Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to esp_flash_init()).

2.6. Storage API
Public Members

`spi_flash_host_driver_t *host`
Pointer to hardware-specific “host_driver” structure. Must be initialized before used.

`const spi_flash_chip_t *chip_drv`
Pointer to chip-model-specific “adapter” structure. If NULL, will be detected during initialisation.

`const esp_flash_os_functions_t *os_func`
Pointer to os-specific hook structure. Call `esp_flash_init_os_functions()` to setup this field, after the host is properly initialized.

`void *os_func_data`
Pointer to argument for os-specific hooks. Left NULL and will be initialized with `os_func`.

`esp_flash_io_mode_t read_mode`
Configured SPI flash read mode. Set before `esp_flash_init` is called.

`uint32_t size`
Size of SPI flash in bytes. If 0, size will be detected during initialisation.

`uint32_t chip_id`
Detected chip id.

Type Definitions

```c
typedef struct spi_flash_chip_t spi_flash_chip_t
typedef struct esp_flash_t esp_flash_t
```

Header File

- `soc/include/hal/spi_flash_types.h`

Structures

```c
struct spi_flash_trans_t
Definition of a common transaction. Also holds the return value.
```

Public Members

`uint8_t command`
Command to send, always 8bits.

`uint8_t mosi_len`
Output data length, in bytes.

`uint8_t miso_len`
Input data length, in bytes.

`uint8_t address_bitlen`
Length of address in bits, set to 0 if command does not need an address.

`uint32_t address`
Address to perform operation on.
const uint8_t *mosi_data
Output data to salve.

uint8_t *miso_data
[out] Input data from slave, little endian

struct spi_flash_host_driver_t
Host driver configuration and context structure.

Public Members

void *driver_data
Configuration and static data used by the specific host driver. The type is determined by the host driver.

esp_err_t (*dev_config)(spi_flash_host_driver_t *driver)
Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously.

esp_err_t (*common_command)(spi_flash_host_driver_t *driver, spi_flash_trans_t *t)
Send an user-defined spi transaction to the device.

esp_err_t (*read_id)(spi_flash_host_driver_t *driver, uint32_t *id)
Read flash ID.

void (*erase_chip)(spi_flash_host_driver_t *driver)
Erase whole flash chip.

void (*erase_sector)(spi_flash_host_driver_t *driver, uint32_t start_address)
Erase a specific sector by its start address.

void (*erase_block)(spi_flash_host_driver_t *driver, uint32_t start_address)
Erase a specific block by its start address.

esp_err_t (*read_status)(spi_flash_host_driver_t *driver, uint8_t *out_sr)
Read the status of the flash chip.

esp_err_t (*set_write_protect)(spi_flash_host_driver_t *driver, bool wp)
Disable write protection.

void (*program_page)(spi_flash_host_driver_t *driver, const void *buffer, uint32_t address, uint32_t length)
Program a page of the flash. Check max_write_bytes for the maximum allowed writing length.

bool (*supports_direct_write)(spi_flash_host_driver_t *driver, const void *p)
Check whether need to allocate new buffer to write

bool (*supports_direct_read)(spi_flash_host_driver_t *driver, const void *p)
Check whether need to allocate new buffer to read

int max_write_bytes
maximum length of program_page

esp_err_t (*read)(spi_flash_host_driver_t *driver, void *buffer, uint32_t address, uint32_t read_len)
Read data from the flash. Check max_read_bytes for the maximum allowed reading length.

int max_read_bytes
maximum length of read

bool (*host_idle)(spi_flash_host_driver_t *driver)
Check whether the host is idle to perform new operations.
include esp_spiflash_host.h

esp_err_t (*configure_host_io_mode)(spi_flash_host_driver_t *driver, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, esp_flash_io_mode_t io_mode)

Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

void (*poll_cmd_done)(spi_flash_host_driver_t *driver)

Internal use, poll the HW until the last operation is done.

esp_err_t (*flush_cache)(spi_flash_host_driver_t *driver, uint32_t addr, uint32_t size)

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

Macros

ESP_FLASH_SPEED_MIN
Lowest speed supported by the driver, currently 5 MHz.

SPI_FLASH_READ_MODE_MIN
Slowest io mode supported by ESP32, currently SlowRd.

Type Definitions

typedef struct spi_flash_host_driver_t spi_flash_host_driver_t

Enumerations

enum esp_flash_speed_t
SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the ESP_FLASH_SPEED_MAX−1 or highest frequency supported by your flash, and decrease the speed until the probing success.

Values:

ESP_FLASH_5MHZ = 0
The flash runs under 5MHz.

ESP_FLASH_10MHZ
The flash runs under 10MHz.

ESP_FLASH_20MHZ
The flash runs under 20MHz.

ESP_FLASH_26MHZ
The flash runs under 26MHz.

ESP_FLASH_40MHZ
The flash runs under 40MHz.

ESP_FLASH_80MHZ
The flash runs under 80MHz.

ESP_FLASH_SPEED_MAX
The maximum frequency supported by the host is ESP_FLASH_SPEED_MAX−1.
enum esp_flash_io_mode_t
   Mode used for reading from SPI flash.
   Values:
   
   SPI_FLASH_SLOWRD = 0
      Data read using single I/O, some limits on speed.
   
   SPI_FLASH_FASTRD
      Data read using single I/O, no limit on speed.
   
   SPI_FLASH_DOUT
      Data read using dual I/O.
   
   SPI_FLASH_DIO
      Both address & data transferred using dual I/O.
   
   SPI_FLASH_QOUT
      Data read using quad I/O.
   
   SPI_FLASH_QIO
      Both address & data transferred using quad I/O.
   
   SPI_FLASH_READ_MODE_MAX
      The fastest io mode supported by the host is ESP_FLASH_READ_MODE_MAX-1.

API Reference - Partition Table

Header File

- spi_flash/include/esp_partition.h

Functions

esp_partition_iterator_t esp_partition_find (esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)

Find partition based on one or more parameters.

Return iterator which can be used to enumerate all the partitions found, or NULL if no partitions were found. Iterator obtained through this function has to be released using esp_partition_iterator_release when not used any more.

Parameters

- type: Partition type, one of esp_partition_type_t values
- subtype: Partition subtype, one of esp_partition_subtype_t values. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
- label: (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

const esp_partition_t *esp_partition_find_first (esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)

Find first partition based on one or more parameters.
Return pointer to \texttt{esp\_partition\_t} structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

Parameters

\begin{itemize}
  \item type: Partition type, one of \texttt{esp\_partition\_type\_t} values
  \item subtype: Partition subtype, one of \texttt{esp\_partition\_subtype\_t} values. To find all partitions of given type, use \texttt{ESP\_PARTITION\_SUBTYPE\_ANY}.
  \item label: (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.
\end{itemize}

\texttt{const esp\_partition\_t \*esp\_partition\_get (esp\_partition\_iterator\_t iterator)}

Get \texttt{esp\_partition\_t} structure for given partition.

Return pointer to \texttt{esp\_partition\_t} structure. This pointer is valid for the lifetime of the application.

Parameters

\begin{itemize}
  \item iterator: Iterator obtained using \texttt{esp\_partition\_find}. Must be non-NULL.
\end{itemize}

\texttt{esp\_partition\_iterator\_t \*esp\_partition\_next (esp\_partition\_iterator\_t iterator)}

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.

Return NULL if no partition was found, valid \texttt{esp\_partition\_iterator\_t} otherwise.

Parameters

\begin{itemize}
  \item iterator: Iterator obtained using \texttt{esp\_partition\_find}. Must be non-NULL.
\end{itemize}

\texttt{void esp\_partition\_iterator\_release (esp\_partition\_iterator\_t iterator)}

Release partition iterator.

Parameters

\begin{itemize}
  \item iterator: Iterator obtained using \texttt{esp\_partition\_find}. Must be non-NULL.
\end{itemize}

\texttt{const esp\_partition\_t \*esp\_partition\_verify (const esp\_partition\_t \*partition)}

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from \texttt{esp\_partition\_get()}, as a test for equality.

Return

\begin{itemize}
  \item If partition not found, returns NULL.
  \item If found, returns a pointer to the \texttt{esp\_partition\_t} structure in flash. This pointer is always valid for the lifetime of the application.
\end{itemize}

Parameters

\begin{itemize}
  \item partition: Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.
\end{itemize}
esp_err_t esp_partition_read(const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)

Read data from the partition.

Return ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

Parameters

• partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
• dst: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
• src_offset: Address of the data to be read, relative to the beginning of the partition.
• size: Size of data to be read, in bytes.

esp_err_t esp_partition_write(const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)

Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using esp_partition_erase_range function.

Partitions marked with an encryption flag will automatically be written via the spi_flash_write_encrypted() function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the spi_flash_write_encrypted() function for more details. Unencrypted partitions do not have this restriction.

Note Prior to writing to flash memory, make sure it has been erased with esp_partition_erase_range call.

Return ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of error codes from lower-level flash driver.

Parameters

• partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
• dst_offset: Address where the data should be written, relative to the beginning of the partition.
• src: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
• size: Size of data to be written, in bytes.

esp_err_t esp_partition_erase_range(const esp_partition_t *partition, size_t offset, size_t size)

Erase part of the partition.

Return ESP_OK, if the range was erased successfully; ESP_ERR_INVALID_ARG, if iterator or dst are NULL; ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition; or one of error codes from lower-level flash driver.

Parameters

• partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
• offset: Offset from the beginning of partition where erase operation should start. Must be aligned to 4 kilobytes.
• size: Size of the range which should be erased, in bytes. Must be divisible by 4 kilobytes.

```
esp_err_t esp_partition_mmap(const esp_partition_t *partition, size_t offset, size_t size,
                              spi_flash_mmap_memory_t memory, const void **out_ptr,
                              spi_flash_mmap_handle_t *out_handle)
```

Configure MMU to map partition into data memory.

Unlike spi_flash_mmap function, which requires a 64kB aligned base address, this function doesn’t impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via out_ptr argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via out_handle argument to spi_flash_munmap function.

**Return** ESP_OK, if successful

**Parameters**

• partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
• offset: Offset from the beginning of partition where mapping should start.
• size: Size of the area to be mapped.
• memory: Memory space where the region should be mapped
• out_ptr: Output, pointer to the mapped memory region
• out_handle: Output, handle which should be used for spi_flash_munmap call

```
esp_err_t esp_partition_get_sha256(const esp_partition_t *partition, uint8_t *sha_256)
```

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP_ERR_IMAGE_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

**Return**

• ESP_OK: In case of successful operation.
• ESP_ERR_INVALID_ARG: The size was 0 or the sha_256 was NULL.
• ESP_ERR_NO_MEM: Cannot allocate memory for sha256 operation.
• ESP_ERR_IMAGE_INVALID: App partition doesn’t contain a valid app image.
• ESP_FAIL: An allocation error occurred.

**Parameters**

• partition: Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
• sha_256: Returned SHA-256 digest for a given partition.
bool esp_partition_check_identity(const esp_partition_t *partition_1, const esp_partition_t *partition_2)

Check for the identity of two partitions by SHA-256 digest.

Return

- True: In case of the two firmware is equal.
- False: Otherwise

Parameters

- partition_1: Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
- partition_2: Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

esp_err_t esp_partition_register_external(esp_flash_t *flash_chip, size_t offset, size_t size, const char *label, esp_partition_type_t type, esp_partition_subtype_t subtype, const esp_partition_t **out_partition)

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the esp_flash_t structure) as partitions. This allows using them with components which access SPI flash through the esp_partition API.

Return

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if CONFIG_CONFIG_SPI_FLASH_USE_LEGACY_IMPL is enabled
- ESP_ERR_NO_MEM if memory allocation has failed
- ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
- ESP_ERR_INVALID_SIZE if the partition doesn’t fit into the flash chip size

Parameters

- flash_chip: Pointer to the structure identifying the flash chip
- offset: Address in bytes, where the partition starts
- size: Size of the partition in bytes
- label: Partition name
- type: One of the partition types (ESP_PARTITION_TYPE_*). Note that applications can not be booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
- subtype: One of the partition subtypes (ESP_PARTITION_SUBTYPE_*)
- out_partition: Output, if non-NULL, receives the pointer to the resulting esp_partition_t structure

esp_err_t esp_partition_deregister_external(const esp_partition_t *partition)

Deregister the partition previously registered using esp_partition_register_external.

Return

- ESP_OK on success
• ESP_ERR_NOT_FOUND if the partition pointer is not found
• ESP_ERR_INVALID_ARG if the partition comes from the partition table
• ESP_ERR_INVALID_ARG if the partition was not registered using esp_partition_register_external function.

Parameters
• partition: pointer to the partition structure obtained from esp_partition_register_external,

Structures

struct esp_partition_t
partition information structure
This is not the format in flash, that format is esp_partition_info_t.
However, this is the format used by this API.

Public Members

esp_flash_t *flash_chip
SPI flash chip on which the partition resides

esp_partition_type_t type
partition type (app/data)

esp_partition_subtype_t subtype
partition subtype

uint32_t address
starting address of the partition in flash

uint32_t size
size of the partition, in bytes

cchar label[17]
partition label, zero-terminated ASCII string

bool encrypted
flag is set to true if partition is encrypted

Macros

ESP_PARTITION_SUBTYPE_OTA(i)
Convenience macro to get esp_partition_subtype_t value for the i-th OTA partition.

Type Definitions

typedef struct esp_partition_iterator_opaque_ *esp_partition_iterator_t
Opaque partition iterator type.
Enumerations

**enum esp_partition_type_t**
Partition type.

*Note* Keep this enum in sync with PartitionDefinition class gen_esp32part.py

**Values:**

**ESP_PARTITION_TYPE_APP** = 0x00
Application partition type.

**ESP_PARTITION_TYPE_DATA** = 0x01
Data partition type.

**enum esp_partition_subtype_t**
Partition subtype.

*Note* Keep this enum in sync with PartitionDefinition class gen_esp32part.py

**Values:**

**ESP_PARTITION_SUBTYPE_APP_FACTORY** = 0x00
Factory application partition.

**ESP_PARTITION_SUBTYPE_APP_OTA_MIN** = 0x10
Base for OTA partition subtypes.

**ESP_PARTITION_SUBTYPE_APP_OTA_0** = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 0
OTA partition 0.

**ESP_PARTITION_SUBTYPE_APP_OTA_1** = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 1
OTA partition 1.

**ESP_PARTITION_SUBTYPE_APP_OTA_2** = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 2
OTA partition 2.

**ESP_PARTITION_SUBTYPE_APP_OTA_3** = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 3
OTA partition 3.

**ESP_PARTITION_SUBTYPE_APP_OTA_4** = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 4
OTA partition 4.

**ESP_PARTITION_SUBTYPE_APP_OTA_5** = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 5
OTA partition 5.

**ESP_PARTITION_SUBTYPE_APP_OTA_6** = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 6
OTA partition 6.

**ESP_PARTITION_SUBTYPE_APP_OTA_7** = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 7
OTA partition 7.

**ESP_PARTITION_SUBTYPE_APP_OTA_8** = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 8
OTA partition 8.

**ESP_PARTITION_SUBTYPE_APP_OTA_9** = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 9
OTA partition 9.

**ESP_PARTITION_SUBTYPE_APP_OTA_10** = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 10
OTA partition 10.
ESP_PARTITION_SUBTYPE_APP_OTA_11 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 11
OTA partition 11.

ESP_PARTITION_SUBTYPE_APP_OTA_12 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 12
OTA partition 12.

ESP_PARTITION_SUBTYPE_APP_OTA_13 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 13
OTA partition 13.

ESP_PARTITION_SUBTYPE_APP_OTA_14 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 14
OTA partition 14.

ESP_PARTITION_SUBTYPE_APP_OTA_15 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 15
OTA partition 15.

ESP_PARTITION_SUBTYPE_APP_OTA_MAX = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 16
Max subtype of OTA partition.

ESP_PARTITION_SUBTYPE_APP_TEST = 0x20
Test application partition.

ESP_PARTITION_SUBTYPE_DATA_OTA = 0x00
OTA selection partition.

ESP_PARTITION_SUBTYPE_DATA_PHY = 0x01
PHY init data partition.

ESP_PARTITION_SUBTYPE_DATA_NVS = 0x02
NVS partition.

ESP_PARTITION_SUBTYPE_DATA_COREDUMP = 0x03
COREDUMP partition.

ESP_PARTITION_SUBTYPE_DATA_NVS_KEYS = 0x04
Partition for NVS keys.

ESP_PARTITION_SUBTYPE_DATA_EFUSE_EM = 0x05
Partition for emulate eFuse bits.

ESP_PARTITION_SUBTYPE_DATA_ESPHTTPD = 0x80
ESPHTTPD partition.

ESP_PARTITION_SUBTYPE_DATA_FAT = 0x81
FAT partition.

ESP_PARTITION_SUBTYPE_DATA_SPIFFS = 0x82
SPIFFS partition.

ESP_PARTITION_SUBTYPE_ANY = 0xff
Used to search for partitions with any subtype.

API Reference - Flash Encrypt

Header File

- bootloader_support/include.esp_flash_encrypt.h
Functions

**static** bool `esp_flash_encryption_enabled` (void)
Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the FLASH_CRYPT_CNT efuse has an odd number of bits set.

**Return** true if flash encryption is enabled.

`esp_err_t esp_flash_encrypt_check_and_update` (void)
`esp_err_t esp_flash_encrypt_region` (uint32_t `src_addr`, size_t `data_length`)
Encrypt-in-place a block of flash sectors.

**Note** This function resets RTC_WDT between operations with sectors.

**Return** ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails, ESP_ERR_FLASH_OP_TIMEOUT if flash times out.

**Parameters**
- `src_addr`: Source offset in flash. Should be multiple of 4096 bytes.
- `data_length`: Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

`void esp_flash_write_protect_crypt_cnt` (void)
Write protect FLASH_CRYPT_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

`esp_flash_enc_mode_t esp_get_flash_encryption_mode` (void)
Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

**Return**

`void esp_flash_encryption_init_checks` (void)
Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

**Note** This function is called automatically during app startup, it doesn’t need to be called from the app.

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn’t match the project config in any way

Enumerations

**enum esp_flash_enc_mode_t**

**Values:**

- `ESP_FLASH_ENC_MODE_DISABLED`
- `ESP_FLASH_ENC_MODE_DEVELOPMENT`
2.6.7 SPIFFS Filesystem

Overview

SPIFFS is a file system intended for SPI NOR flash devices on embedded targets. It supports wear levelling, file system consistency checks, and more.

Notes

- Currently, SPIFFS does not support directories, it produces a flat structure. If SPIFFS is mounted under /spiffs, then creating a file with the path /spiffs/tmp/myfile.txt will create a file called /tmp/myfile.txt in SPIFFS, instead of myfile.txt in the directory /spiffs/tmp.
- It is not a real-time stack. One write operation might take much longer than another.
- For now, it does not detect or handle bad blocks.

Tools

spiffsgen.py

spiffsgen.py is a write-only Python SPIFFS implementation used to create filesystem images from the contents of a host folder. To use spiffsgen.py, open Terminal and run:

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

The required arguments are as follows:

- **image_size**: size of the partition onto which the created SPIFFS image will be flashed.
- **base_dir**: directory for which the SPIFFS image needs to be created.
- **output_file**: SPIFFS image output file.

There are also other arguments that control image generation. Documentation on these arguments can be found in the tool’s help:

```
python spiffsgen.py --help
```

These optional arguments correspond to a possible SPIFFS build configuration. To generate the right image, please make sure that you use the same arguments/configuration as were used to build SPIFFS. As a guide, the help output indicates the SPIFFS build configuration to which the argument corresponds. In cases when these arguments are not specified, the default values shown in the help output will be used.

When the image is created, it can be flashed using esptool.py or parttool.py.

Aside from invoking the spiffsgen.py standalone by manually running it from the command line or a script, it is also possible to invoke spiffsgen.py directly from the build system by calling spiffs_create_partition_image.

Make:
SPIFFS_IMAGE_FLASH_IN_PROJECT := ...
SPIFFS_IMAGE_DEPENDS := ...
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))

CMake:

spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS dep dep...])

This is more convenient as the build configuration is automatically passed to the tool, ensuring that the generated image is valid for that build. An example of this is while the image size is required for the standalone invocation, only the partition name is required when using spiffs_create_partition_image – the image size is automatically obtained from the project’s partition table.

Due to the differences in structure between Make and CMake, it is important to note that: - for Make spiffs_create_partition_image must be called from the project Makefile - for CMake spiffs_create_partition_image must be called from one of the component CMakeLists.txt files

Optionally, user can opt to have the image automatically flashed together with the app binaries, partition tables, etc. on idf.py flash or make flash by specifying FLASH_IN_PROJECT. For example,

in Make:

SPIFFS_IMAGE_FLASH_IN_PROJECT := 1
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))

in CMake:

spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)

If FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT is not specified, the image will still be generated, but you will have to flash it manually using esptool.py, parttool.py, or a custom build system target.

There are cases where the contents of the base directory itself is generated at build time. Users can use DEPENDS/SPIFFS_IMAGE_DEPENDS to specify targets that should be executed before generating the image.

in Make:

dep:
    ...
SPIFFS_IMAGE_DEPENDS := dep
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))

in CMake:

add_custom_target(dep COMMAND ...)
spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)

+For an example, see examples/storage/spiffsgen>.

mkspiffs

Another tool for creating SPIFFS partition images is mkspiffs. Similar to spiffsgen.py, it can be used to create an image from a given folder and then flash that image using esptool.py

For that, you need to obtain the following parameters:
Read the Docs Template Documentation, Release v4.1

- **Block Size**: 4096 (standard for SPI Flash)
- **Page Size**: 256 (standard for SPI Flash)
- **Image Size**: Size of the partition in bytes (can be obtained from a partition table)
- **Partition Offset**: Starting address of the partition (can be obtained from a partition table)

To pack a folder into a 1-Megabyte image, run:

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

To flash the image onto ESP32 at offset 0x110000, run:

```
python esptool.py --chip esp32 --port [port] --baud [baud] write_flash -z 0x110000
˓→spiffs.bin
```

**Notes on which SPIFFS tool to use**

The two tools presented above offer very similar functionality. However, there are reasons to prefer one over the other, depending on the use case.

Use `spiffsgen.py` in the following cases: 1. If you want to simply generate a SPIFFS image during the build. `spiffsgen.py` makes it very convenient by providing functions/commands from the build system itself. 2. If the host has no C/C++ compiler available, because `spiffsgen.py` does not require compilation.

Use `mkspiffs` in the following cases: 1. If you need to unpack SPIFFS images in addition to image generation. For now, it is not possible with `spiffsgen.py`. 2. If you have an environment where a Python interpreter is not available, but a host compiler is available. Otherwise, a pre-compiled `mkspiffs` binary can do the job. However, there is no build system integration for `mkspiffs` and the user has to do the corresponding work: compiling `mkspiffs` during build (if a pre-compiled binary is not used), creating build rules/targets for the output files, passing proper parameters to the tool, etc.

**See also**

- `Partition Table documentation`

**Application Example**

An example of using SPIFFS is provided in the `storage/spiffs` directory. This example initializes and mounts a SPIFFS partition, then writes and reads data from it using POSIX and C library APIs. See the README.md file in the example directory for more information.

**High-level API Reference**

**Header File**

- `spiffs/include/esp_spiffs.h`
Functions

```c
esp_err_t esp_vfs_spiffs_register(const esp_vfs_spiffs_conf_t *conf)
```
Register and mount SPIFFS to VFS with given path prefix.

Return

- ESP_OK if success
- ESP_ERR_NO_MEM if objects could not be allocated
- ESP_ERR_INVALID_STATE if already mounted or partition is encrypted
- ESP_ERR_NOT_FOUND if partition for SPIFFS was not found
- ESP_FAIL if mount or format fails

Parameters

- `conf`: Pointer to `esp_vfs_spiffs_conf_t` configuration structure

```c
esp_err_t esp_vfs_spiffs_unregister(const char *partition_label)
```
Unregister and unmount SPIFFS from VFS

Return

- ESP_OK if successful
- ESP_INVALID_STATE already unregistered

Parameters

- `partition_label`: Same label as passed to `esp_vfs_spiffs_register`.

```c
bool esp_spiffs Mounted(const char *partition_label)
```
Check if SPIFFS is mounted

Return

- true if mounted
- false if not mounted

Parameters

- `partition_label`: Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

```c
esp_err_t esp_vfs_spiffs_format(const char *partition_label)
```
Format the SPIFFS partition

Return

- ESP_OK if successful
- ESP_FAIL on error

Parameters

- `partition_label`: Same label as passed to `esp_vfs_spiffs_register`.

```c
esp_err_t esp_vfs_spiffs_info(const char *partition_label, size_t *total_bytes, size_t *used_bytes)
```
Get information for SPIFFS

2.6. Storage API
Return

• ESP_OK if success
• ESP_ERR_INVALID_STATE if not mounted

Parameters

• partition_label: Same label as passed to esp_vfs_spiffs_register
• total_bytes: Size of the file system
• used_bytes: Current used bytes in the file system

Structures

struct esp_vfs_spiffs_conf_t
Configuration structure for esp_vfs_spiffs_register.

Public Members

const char *base_path
File path prefix associated with the filesystem.

const char *partition_label
Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

size_t max_files
Maximum files that could be open at the same time.

bool format_if_mount_failed
If true, it will format the file system if it fails to mount.

2.6.8 Virtual filesystem component

Overview

Virtual filesystem (VFS) component provides a unified interface for drivers which can perform operations on file-like objects. These can be real filesystems (FAT, SPIFFS, etc.) or device drivers which provide a file-like interface.

This component allows C library functions, such as fopen and fprintf, to work with FS drivers. At a high level, each FS driver is associated with some path prefix. When one of C library functions needs to open a file, the VFS component searches for the FS driver associated with the file path and forwards the call to that driver. VFS also forwards read, write, and other calls for the given file to the same FS driver.

For example, one can register a FAT filesystem driver with the /fat prefix and call fopen("/fat/file.txt", "w"). The VFS component will then call the function open of the FAT driver and pass the argument /file.txt to it together with appropriate mode flags. All subsequent calls to C library functions for the returned FILE* stream will also be forwarded to the FAT driver.
FS registration

To register an FS driver, an application needs to define an instance of the `esp_vfs_t` structure and populate it with function pointers to FS APIs:

```c
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Depending on the way how the FS driver declares its API functions, either `read`, `write`, etc., or `read_p`, `write_p`, etc., should be used.

Case 1: API functions are declared without an extra context pointer (the FS driver is a singleton):

```c
ssize_t myfs_write(int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized

// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Case 2: API functions are declared with an extra context pointer (the FS driver supports multiple instances):

```c
ssize_t myfs_write(myfs_t* fs, int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));

// Can register another instance:
myfs_t* myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));
```

Synchronous input/output multiplexing

Synchronous input/output multiplexing by `select()` is supported in the VFS component. The implementation works in the following way.

1. `select()` is called with file descriptors which could belong to various VFS drivers.
2. The file descriptors are divided into groups each belonging to one VFS driver.
3. The file descriptors belonging to non-socket VFS drivers are handed over to the given VFS drivers by `start_select()` described later on this page. This function represents the driver-specific implementation of `select()` for the given driver. This should be a non-blocking call which means the function should immediately return after setting up the environment for checking events related to the given file descriptors.

4. The file descriptors belonging to the socket VFS driver are handed over to the socket driver by `socket_select()` described later on this page. This is a blocking call which means that it will return only if there is an event related to socket file descriptors or a non-socket driver signals `socket_select()` to exit.

5. Results are collected from each VFS driver and all drivers are stopped by deinitialization of the environment for checking events.

6. The `select()` call ends and returns the appropriate results.

**Non-socket VFS drivers**

If you want to use `select()` with a file descriptor belonging to a non-socket VFS driver then you need to register the driver with functions `start_select()` and `end_select()` similarly to the following example:

```c
// In definition of esp_vfs_t:
    .start_select = &uart_start_select,
    .end_select = &uart_end_select,
// ... other members initialized
```

`start_select()` is called for setting up the environment for detection of read/write/error conditions on file descriptors belonging to the given VFS driver.

`end_select()` is called to stop/deinitialize/free the environment which was setup by `start_select()`.

**Note:** `end_select()` might be called without a previous `start_select()` call in some rare circumstances. `end_select()` should fail gracefully if this is the case.

Please refer to the reference implementation for the UART peripheral in `vfs/vfs_uart.c` and most particularly to the functions `esp_vfs_dev_uart_register()`, `uart_start_select()`, and `uart_end_select()` for more information.

Please check the following examples that demonstrate the use of `select()` with VFS file descriptors:

- peripherals/uart/uart_select
- system/select

**Socket VFS drivers**

A socket VFS driver is using its own internal implementation of `select()` and non-socket VFS drivers notify it upon read/write/error conditions.

A socket VFS driver needs to be registered with the following functions defined:

```c
// In definition of esp_vfs_t:
    .socket_select = &lwip_select,
    .get_socket_select_semaphore = &lwip_get_socket_select_semaphore,
    .stop_socket_select = &lwip_stop_socket_select,
    .stop_socket_select_isr = &lwip_stop_socket_select_isr,
// ... other members initialized
```
socket_select() is the internal implementation of select() for the socket driver. It works only with file descriptors belonging to the socket VFS.

get_socket_select_semaphore() returns the signalization object (semaphore) which will be used in non-socket drivers to stop the waiting in socket_select().

stop_socket_select() call is used to stop the waiting in socket_select() by passing the object returned by get_socket_select_semaphore().

stop_socket_select_isr() has the same functionality as stop_socket_select() but it can be used from ISR.

Please see lwip/port/esp32/vfs_lwip.c for a reference socket driver implementation using LWIP.

---

**Note:** If you use select() for socket file descriptors only then you can enable the CONFIG_LWIP_USE_ONLY_LWIP_SELECT option to reduce the code size and improve performance.

---

**Note:** Don’t change the socket driver during an active select() call or you might experience some undefined behavior.

---

**Paths**

Each registered FS has a path prefix associated with it. This prefix can be considered as a “mount point” of this partition.

In case when mount points are nested, the mount point with the longest matching path prefix is used when opening the file. For instance, suppose that the following filesystems are registered in VFS:

- FS 1 on /data
- FS 2 on /data/static

Then:

- FS 1 will be used when opening a file called /data/log.txt
- FS 2 will be used when opening a file called /data/static/index.html
- Even if /index.html" does not exist in FS 2, FS 1 will not be searched for /static/index.html.

As a general rule, mount point names must start with the path separator (/) and must contain at least one character after path separator. However, an empty mount point name is also supported and might be used in cases when an application needs to provide a “fallback” filesystem or to override VFS functionality altogether. Such filesystem will be used if no prefix matches the path given.

VFS does not handle dots (.) in path names in any special way. VFS does not treat .. as a reference to the parent directory. In the above example, using a path /data/static/../log.txt will not result in a call to FS 1 to open /log.txt. Specific FS drivers (such as FATFS) might handle dots in file names differently.

When opening files, the FS driver receives only relative paths to files. For example:

1. The myfs driver is registered with /data as a path prefix.
2. The application calls fopen("/data/config.json", ...).
3. The VFS component calls myfs_open("/config.json", ...).
4. The myfs driver opens the /config.json file.
VFS does not impose any limit on total file path length, but it does limit the FS path prefix to ESP_VFS_PATH_MAX characters. Individual FS drivers may have their own filename length limitations.

**File descriptors**

File descriptors are small positive integers from 0 to FD_SETSIZE - 1, where FD_SETSIZE is defined in newlib’s sys/types.h. The largest file descriptors (configured by CONFIG_LWIP_MAX_SOCKETS) are reserved for sockets. The VFS component contains a lookup-table called s_fd_table for mapping global file descriptors to VFS driver indexes registered in the s_vfs array.

**Standard IO streams (stdin, stdout, stderr)**

If the menuconfig option UART for console output is not set to None, then stdin, stdout, and stderr are configured to read from, and write to, a UART. It is possible to use UART0 or UART1 for standard IO. By default, UART0 is used with 115200 baud rate; TX pin is GPIO1; RX pin is GPIO3. These parameters can be changed in menuconfig.

Writing to stdout or stderr will send characters to the UART transmit FIFO. Reading from stdin will retrieve characters from the UART receive FIFO.

By default, VFS uses simple functions for reading from and writing to UART. Writes busy-wait until all data is put into UART FIFO, and reads are non-blocking, returning only the data present in the FIFO. Due to this non-blocking read behavior, higher level C library calls, such as fscanf("%d\n", &var);, might not have desired results.

Applications which use the UART driver can instruct VFS to use the driver’s interrupt driven, blocking read and write functions instead. This can be done using a call to the esp_vfs_dev_uart_use_driver function. It is also possible to revert to the basic non-blocking functions using a call to esp_vfs_dev_uart_use_nonblocking.

VFS also provides an optional newline conversion feature for input and output. Internally, most applications send and receive lines terminated by the LF (‘’n’’) character. Different terminal programs may require different line termination, such as CR or CRLF. Applications can configure this separately for input and output either via menuconfig, or by calls to the functions esp_vfs_dev_uart_set_rx_line_endings and esp_vfs_dev_uart_set_tx_line_endings.

**Standard streams and FreeRTOS tasks**

FILE objects for stdin, stdout, and stderr are shared between all FreeRTOS tasks, but the pointers to these objects are stored in per-task struct _reent.

The following code is transferred to fprintf(__getreent()->_stderr, "42\n"); by the preprocessor:

```c
fprintf(stderr, "42\n");
```

The __getreent () function returns a per-task pointer to struct _reent (newlib/include/sys/reent.h#L370-L417). This structure is allocated on the TCB of each task. When a task is initialized, _stdin, _stdout, and _stderr members of struct _reent are set to the values of _stdin, _stdout, and _stderr of _GLOBAL_REENT (i.e., the structure which is used before FreeRTOS is started).

Such a design has the following consequences:

- It is possible to set stdin, stdout, and stderr for any given task without affecting other tasks, e.g., by doing stdin = fopen("/dev/uart/1", "r").
- Closing default stdin, stdout, or stderr using fclose will close the FILE stream object, which will affect all other tasks.
• To change the default stdin, stdout, stderr streams for new tasks, modify _GLOBAL_REENT->_stdin (_stdout, _stderr) before creating the task.

Application Example

Instructions

API Reference

Header File

• vfs/include/esp_vfs.h

Functions

ssize_t esp_vfs_write (struct _reent *r, int fd, const void *data, size_t size)

These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

off_t esp_vfs_lseek (struct _reent *r, int fd, off_t size, int mode)

ssize_t esp_vfs_read (struct _reent *r, int fd, void *dst, size_t size)

int esp_vfs_open (struct _reent *r, const char *path, int flags, int mode)

int esp_vfs_close (struct _reent *r, int fd)

int esp_vfs_fstat (struct _reent *r, int fd, struct stat *st)

int esp_vfs_stat (struct _reent *r, const char *path, struct stat *st)

int esp_vfs_link (struct _reent *r, const char *nl, const char *n2)

int esp_vfs_unlink (struct _reent *r, const char *path)

int esp_vfsrename (struct _reent *r, const char *src, const char *dst)

int esp_vfs_utime (const char *path, const struct utimbuf *times)

esp_err_t esp_vfs_register (const char *base_path, const esp_vfs_t *vfs, void *ctx)

Register a virtual filesystem for given path prefix.

Return ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

Parameters

• base_path: file path prefix associated with the filesystem. Must be a zero-terminated C string, up to ESP_VFS_PATH_MAX characters long, and at least 2 characters long. Name must start with a “/” and must not end with “/”. For example, “/data” or “/dev/spi” are valid. These VFSes would then be called to handle file paths such as “/data/myfile.txt” or “/dev/spi/0”.

• vfs: Pointer to esp_vfs_t, a structure which maps syscalls to the filesystem driver functions. VFS component doesn’t assume ownership of this pointer.

• ctx: If vfs->flags has ESP_VFS_FLAG_CONTEXT_PTR set, a pointer which should be passed to VFS functions. Otherwise, NULL.
esp_err_t esp_vfs_register_fd_range(const esp_vfs_t *vfs, void *ctx, int min_fd, int max_fd)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors from the interval \(<min\_fd; max\_fd)\).

This is a special-purpose function intended for registering LWIP sockets to VFS.

Return ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

Parameters

• vfs: Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().
• ctx: Pointer to context structure. Meaning is the same as for esp_vfs_register().
• min_fd: The smallest file descriptor this VFS will use.
• max_fd: Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

esp_err_t esp_vfs_register_with_id(const esp_vfs_t *vfs, void *ctx, esp_vfs_id_t *vfs_id)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors. In comparison with esp_vfs_register_fd_range, this function doesn’t pre-registers an interval of file descriptors. File descriptors can be registered later, by using esp_vfs_register_fd.

Return ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

Parameters

• vfs: Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().
• ctx: Pointer to context structure. Meaning is the same as for esp_vfs_register().
• vfs_id: Here will be written the VFS ID which can be passed to esp_vfs_register_fd for registering file descriptors.

esp_err_t esp_vfs_unregister(const char *base_path)

Unregister a virtual filesystem for given path prefix

Return ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered

Parameters

• base_path: file prefix previously used in esp_vfs_register call

esp_err_t esp_vfs_register_fd(esp_vfs_id_t vfs_id, int *fd)

Special function for registering another file descriptor for a VFS registered by esp_vfs_register_with_id.

Return ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

Parameters

• vfs_id: VFS identificator returned by esp_vfs_register_with_id.
• fd: The registered file descriptor will be written to this address.

esp_err_t esp_vfs_unregister_fd(esp_vfs_id_t vfs_id, int fd)

Special function for unregistering a file descriptor belonging to a VFS registered by esp_vfs_register_with_id.

Return ESP_OK if the registration is successful, ESP_ERR_INVALID_ARG if the arguments are incorrect.
Parameters

• \texttt{vfs\_id}: VFS identificator returned by \texttt{esp\_vfs\_register\_with\_id}.
• \texttt{fd}: File descriptor which should be unregistered.

\textbf{int} \texttt{esp\_vfs\_select} (\texttt{int} \texttt{nfds}, \texttt{fd\_set \*readfds}, \texttt{fd\_set \*writefds}, \texttt{fd\_set \*errorfds}, \texttt{struct timeval \*timeout})

Synchronous I/O multiplexing which implements the functionality of POSIX \texttt{select}() for VFS.

\textbf{Return} The number of descriptors set in the descriptor sets, or -1 when an error (specified by \texttt{errno}) have occurred.

Parameters

• \texttt{nfds}: Specifies the range of descriptors which should be checked. The first \texttt{nfds} descriptors will be checked in each set.
• \texttt{readfds}: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
• \texttt{writefds}: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
• \texttt{errorfds}: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
• \texttt{timeout}: If not NULL, then points to timeval structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out.

\textbf{void} \texttt{esp\_vfs\_select\_triggered} (\texttt{esp\_vfs\_select\_sem\_t sem})

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to \texttt{start\_select}.

Parameters

• \texttt{sem}: semaphore structure which was passed to the driver by the \texttt{start\_select} call

\textbf{void} \texttt{esp\_vfs\_select\_triggered\_ isr} (\texttt{esp\_vfs\_select\_sem\_t sem}, \texttt{ BaseType\_t \*woken})

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to \texttt{start\_select}.

Parameters

• \texttt{sem}: semaphore structure which was passed to the driver by the \texttt{start\_select} call
• \texttt{woken}: is set to \texttt{pdTRUE} if the function wakes up a task with higher priority

\textbf{int} \texttt{esp\_vfs\_poll} (\texttt{struct pollfd \*fds}, \texttt{nfds\_t nfds}, \texttt{int timeout})

Implements the VFS layer for synchronous I/O multiplexing by \texttt{poll}().

The implementation is based on \texttt{esp\_vfs\_select}. The parameters and return values are compatible with POSIX \texttt{poll}().
Return A positive return value indicates the number of file descriptors that have been selected. The 0 return value indicates a timed-out poll. -1 is return on failure and errno is set accordingly.

Parameters
- fds: Pointer to the array containing file descriptors and events poll() should consider.
- nfds: Number of items in the array fds.
- timeout: Poll() should wait at least timeout milliseconds. If the value is 0 then it should return immediately. If the value is -1 then it should wait (block) until the event occurs.

ssize_t esp_vfs_pread(int fd, void *dst, size_t size, off_t offset)
Implements the VFS layer of POSIX pread()

Return A positive return value indicates the number of bytes read. -1 is return on failure and errno is set accordingly.

Parameters
- fd: File descriptor used for read
- dst: Pointer to the buffer where the output will be written
- size: Number of bytes to be read
- offset: Starting offset of the read

ssize_t esp_vfs_pwrite(int fd, const void *src, size_t size, off_t offset)
Implements the VFS layer of POSIX pwrite()

Return A positive return value indicates the number of bytes written. -1 is return on failure and errno is set accordingly.

Parameters
- fd: File descriptor used for write
- src: Pointer to the buffer from where the output will be read
- size: Number of bytes to write
- offset: Starting offset of the write

Structures

struct esp_vfs_select_sem_t
VFS semaphore type for select()

Public Members

bool is_sem_local
  type of “sem” is SemaphoreHandle_t when true, defined by socket driver otherwise

void *sem
  semaphore instance
struct esp_vfs_t
VFS definition structure.

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have _p suffix, set flags member to ESP_VFS_FLAG_CONTEXT_PTR and provide the context pointer to esp_vfs_register function. If the implementation doesn’t use this extra argument, populate the members without _p suffix and set flags member to ESP_VFS_FLAG_DEFAULT.

If the FS driver doesn’t provide some of the functions, set corresponding members to NULL.

Public Members

int flags
ESP_VFS_FLAG_CONTEXT_PTR or ESP_VFS_FLAG_DEFAULT

esp_err_t (*start_select)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds, esp_vfs_select_sem_t sem, void **end_select_args)
start_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the given VFS

int (*socket_select)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)
socket select function for socket FDs with the functionality of POSIX select(); this should be set only for the socket VFS

void (*stop_socket_select)(void *sem)
called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver; set only for the socket driver

void (*stop_socket_select_isr)(void *sem, BaseType_t *woken)
stop_socket_select which can be called from ISR; set only for the socket driver

void *(*get_socket_select_semaphore)(void)
end_select is called to stop the I/O multiplexing and deinitialize the environment created by start_select for the given VFS

esp_err_t (*end_select)(void *end_select_args)
get_socket_select_semaphore returns semaphore allocated in the socket driver; set only for the socket driver

Macros

MAX_FDS
Maximum number of (global) file descriptors.

ESP_VFS_PATH_MAX
Maximum length of path prefix (not including zero terminator)

ESP_VFS_FLAG_DEFAULT
Default value of flags member in esp_vfs_t structure.

ESP_VFS_FLAG_CONTEXT_PTR
Flag which indicates that FS needs extra context pointer in syscalls.
Type Definitions

```c
typedef int esp_vfs_id_t
```

Header File

- vfs/include/esp_vfs_dev.h

Functions

```c
void esp_vfs_dev_uart_register (void)
```

Add /dev/uart virtual filesystem driver

This function is called from startup code to enable serial output

```c
void esp_vfs_dev_uart_set_rx_line_endings (esp_line_endings_t mode)
```

Set the line endings expected to be received on UART.

This specifies the conversion between line endings received on UART and newlines (\n, LF) passed into stdin:

- ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
- ESP_LINE_ENDINGS_CR: convert CR to LF
- ESP_LINE_ENDINGS_LF: no modification

**Note** this function is not thread safe w.r.t. reading from UART

**Parameters**

- `mode`: line endings expected on UART

```c
void esp_vfs_dev_uart_set_tx_line_endings (esp_line_endings_t mode)
```

Set the line endings to sent to UART.

This specifies the conversion between newlines (\n, LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

**Note** this function is not thread safe w.r.t. writing to UART

**Parameters**

- `mode`: line endings to send to UART

```c
void esp_vfs_dev_uart_use_nonblocking (int uart_num)
```

Set VFS to use simple functions for reading and writing UART. Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

**Parameters**

- `uart_num`: UART peripheral number
void esp_vfs_dev_uart_use_driver (int uart_num)
set VFS to use UART driver for reading and writing

Note: application must configure UART driver before calling these functions. With these functions, read and write are blocking and interrupt-driven.

Parameters

- uart_num: UART peripheral number

Enumerations

enum esp_line_endings_t
Line ending settings.

Values:

ESP_LINE_ENDINGS_CRLF
CR + LF.

ESP_LINE_ENDINGS_CR
CR.

ESP_LINE_ENDINGS_LF
LF.

2.6.9 Wear Levelling API

Overview

Most of flash memory and especially SPI flash that is used in ESP32 has a sector-based organization and also has a limited number of erase/modification cycles per memory sector. The wear levelling component helps to distribute wear and tear among sectors more evenly without requiring any attention from the user.

The wear levelling component provides API functions related to reading, writing, erasing, and memory mapping of data in external SPI flash through the partition component. The component also has higher-level API functions which work with the FAT filesystem defined in FAT filesystem.

The wear levelling component, together with the FAT FS component, uses FAT FS sectors of 4096 bytes, which is a standard size for flash memory. With this size, the component shows the best performance but needs additional memory in RAM.

To save internal memory, the component has two additional modes which both use sectors of 512 bytes:

- **Performance mode.** Erase sector operation data is stored in RAM, the sector is erased, and then data is copied back to flash memory. However, if a device is powered off for any reason, all 4096 bytes of data is lost.

- **Safety mode.** The data is first saved to flash memory, and after the sector is erased, the data is saved back. If a device is powered off, the data can be recovered as soon as the device boots up.

The default settings are as follows: - Sector size is 512 bytes - Performance mode

You can change the settings through the configuration menu.

The wear levelling component does not cache data in RAM. The write and erase functions modify flash directly, and flash contents are consistent when the function returns.
Wear Levelling access API functions

This is the set of API functions for working with data in flash:

- `wl_mount` - initializes the wear levelling module and mounts the specified partition
- `wl_unmount` - unmounts the partition and deinitializes the wear levelling module
- `wl_erase_range` - erases a range of addresses in flash
- `wl_write` - writes data to a partition
- `wl_read` - reads data from a partition
- `wl_size` - returns the size of available memory in bytes
- `wl_sector_size` - returns the size of one sector

As a rule, try to avoid using raw wear levelling functions and use filesystem-specific functions instead.

Memory Size

The memory size is calculated in the wear levelling module based on partition parameters. The module uses some sectors of flash for internal data.

- FAT Filesystem
- Partition Table documentation

Application Example

An example which combines the wear levelling driver with the FATFS library is provided in the `storage/wear_levelling` directory. This example initializes the wear levelling driver, mounts FATFS partition, as well as writes and reads data from it using POSIX and C library APIs. See the `storage/wear_levelling/README.md` file for more information.

High level API Reference

Header Files

- `fatfs/src/esp_vfs_fat.h`

Functions

```c
esp_err_t esp_vfsFatSpiflashMount(const char *base_path, const char *partition_label,
                                  const esp_vfs_fat_mount_config_t *mount_config,
                                  wl_handle_t *wl_handle)
```

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
• mounts FAT partition using FATFS library on top of flash wear levelling library
• registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact.

Return

• ESP_OK on success
• ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
• ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount was already called
• ESP_ERR_NO_MEM if memory can not be allocated
• ESP_FAIL if partition can not be mounted
• other error codes from wear levelling library, SPI flash driver, or FATFS drivers

Parameters

• base_path: path where FATFS partition should be mounted (e.g. “/spiflash”)
• partition_label: label of the partition which should be used
• mount_config: pointer to structure with extra parameters for mounting FATFS
• wl_handle: wear levelling driver handle

struct esp_vfs_fat_mount_config_t
Configuration arguments for esp_vfs_fat_sdm mmc_mount and esp_vfs_fat_spiflash_mount functions.

Public Members

bool format_if_mount_failed
If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int max_files
Max number of open files.

size_t allocation_unit_size
If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear_levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

esp_err_t esp_vfs_fat_spiflashUnmount (const char *base_path, wl_handle_t wl_handle)
Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount.

Return

• ESP_OK on success
• ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount hasn’t been called

Parameters

• base_path: path where partition should be registered (e.g. “/spiflash”)
• `wl_handle`: wear levelling driver handle returned by `esp_vfs_fat_spiflash_mount`

### Mid level API Reference

**Header File**

- `wear_levelling/include/wear_levelling.h`

**Functions**

```c
esp_err_t wl_mount(const esp_partition_t *partition, wl_handle_t *out_handle)
```

Mount WL for defined partition.

**Return**

- ESP_OK, if the allocation was successfully;
- ESP_ERR_INVALID_ARG, if WL allocation was unsuccessful;
- ESP_ERR_NO_MEM, if there was no memory to allocate WL components;

**Parameters**

- `partition`: that will be used for access
- `out_handle`: handle of the WL instance

```c
esp_err_t wl_unmount(wl_handle_t handle)
```

Unmount WL for defined partition.

**Return**

- ESP_OK, if the operation completed successfully;
- or one of error codes from lower-level flash driver.

**Parameters**

- `handle`: WL partition handle

```c
esp_err_t wl_erase_range(wl_handle_t handle, size_t start_addr, size_t size)
```

Erase part of the WL storage.

**Return**

- ESP_OK, if the range was erased successfully;
- ESP_ERR_INVALID_ARG, if iterator or dst are NULL;
- ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

**Parameters**

- `handle`: WL handle that are related to the partition
- `start_addr`: Address where erase operation should start. Must be aligned to the result of function `wl_sector_size(...)`. 
size: Size of the range which should be erased, in bytes. Must be divisible by result of function
wl_sector_size(...).

```c
esp_err_t wl_write(wl_handle_t handle, size_t dest_addr, const void *src, size_t size)
```

Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using
wl_erase_range function.

**Note** Prior to writing to WL storage, make sure it has been erased with wl_erase_range call.

**Return**

- ESP_OK, if data was written successfully;
- ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

**Parameters**

- handle: WL handle that are related to the partition
- dest_addr: Address where the data should be written, relative to the beginning of the partition.
- src: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- size: Size of data to be written, in bytes.

```c
esp_err_t wl_read(wl_handle_t handle, size_t src_addr, void *dest, size_t size)
```

Read data from the WL storage.

**Return**

- ESP_OK, if data was read successfully;
- ESP_ERR_INVALID_ARG, if src_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

**Parameters**

- handle: WL module instance that was initialized before
- dest: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- src_addr: Address of the data to be read, relative to the beginning of the partition.
- size: Size of data to be read, in bytes.

```c
size_t wl_size(wl_handle_t handle)
```

Get size of the WL storage.

**Return** usable size, in bytes

**Parameters**

- handle: WL module handle that was initialized before
size_t \textbf{wl_sector_size}(\textit{wl\_handle\_t handle})

Get sector size of the WL instance.

\textbf{Return} sector size, in bytes

\textbf{Parameters}

- \textit{handle}: WL module handle that was initialized before

\section*{Macros}

\texttt{WL\_INVALID\_HANDLE}

\section*{Type Definitions}

typedef int32_t \texttt{wl\_handle\_t}

\begin{center}
wear levelling handle
\end{center}

Code examples for this API section are provided in the \texttt{storage} directory of ESP-IDF examples.

\section*{2.7 System API}

\subsection*{2.7.1 App Image Format}

An application image consists of the following structures:

1. The \texttt{esp\_image\_header\_t} structure describes the mode of SPI flash and the count of memory segments.

2. The \texttt{esp\_image\_segment\_header\_t} structure describes each segment, its length, and its location in ESP32’s memory, followed by the data with a length of \texttt{data\_len}. The data offset for each segment in the image is calculated in the following way:

- offset for 0 Segment = sizeof(\texttt{esp\_image\_header\_t}) + sizeof(\texttt{esp\_image\_segment\_header\_t}).

- offset for 1 Segment = offset for 0 Segment + length of 0 Segment + sizeof(\texttt{esp\_image\_segment\_header\_t}).

- offset for 2 Segment = offset for 1 Segment + length of 1 Segment + sizeof(\texttt{esp\_image\_segment\_header\_t}).

- ...

The count of each segment is defined in the \texttt{segment\_count} field that is stored in \texttt{esp\_image\_header\_t}. The count cannot be more than \texttt{ESP\_IMAGE\_MAX\_SEGMENTS}.

To get the list of your image segments, please run the following command:

```
esptool.py --chip esp32 image_info build/app.bin
```

```
esptool.py v2.3.1
Image version: 1
Entry point: 40080ea4
13 segments
Segment 1: 1en 0x13ce0 load 0x3f400020 file_offs 0x00000018 SOC_DROM
Segment 2: 1en 0x00000 load 0x3ff80000 file_offs 0x00013d00 SOC_RTC_DRAM
```

(continues on next page)
You can also see the information on segments in the IDF logs while your application is booting:

```

  → load
I (971) esp_image: segment 11: paddr=0x0000a9b74 vaddr=0x50000004 size=0x0000000 (0)
  → load
I (1012) esp_image: segment 12: paddr=0x0000a9b7c vaddr=0x50000004 size=0x0000000 (0)
  → load
```

For more details on the type of memory segments and their address ranges, see the ESP32 Technical Reference Manual, Section 1.3.2 Embedded Memory.

3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded boundary, so the application image might need padding.

4. If the hash_appended field from esp_image_header_t is set then a SHA256 checksum will be appended. The value of SHA256 is calculated on the range from first byte and up to this field. The length of this field is 32 bytes.

5. If the options CONFIG_SECURE_SIGNED_APPS_SCHEME is set to ECDSA then the application image will have additional 68 bytes for an ECDSA signature, which includes:
   • version word (4 bytes),
   • signature data (64 bytes).
Application Description

The DROM segment starts with the `esp_app_desc_t` structure which carries specific fields describing the application:

- **secure_version** - see `Anti-rollback`.
- **version** - see `App version`.
- **project_name** is filled from `PROJECT_NAME`.
- **time and date** - compile time and date.
- **idf_ver** - version of ESP-IDF.
- **app_elf_sha256** - contains sha256 for the elf application file.

* - The maximum length is 32 characters, including null-termination character. For example, if the length of `PROJECT_NAME` exceeds 32 characters, the excess characters will be disregarded.

This structure is useful for identification of images uploaded OTA because it has a fixed offset = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`. As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued or not.

Adding a Custom Structure to an Application

Customer also has the opportunity to have similar structure with a fixed offset relative to the beginning of the image. The following pattern can be used to add a custom structure to your image:

```c
const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_app_desc = { ... }
```

Offset for custom structure is `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)`.

To guarantee that the custom structure is located in the image even if it is not used, you need to add:

- For Make: add `COMPONENT_ADD_LDFLAGS += -u custom_app_desc` into component.mk
- For Cmake: add `target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc")` into CMakeLists.txt

API Reference

Header File

- bootloader_support/include/esp_app_format.h

Structures

```c
struct esp_image_header_t
    Main header of binary image.
```
Public Members

uint8_t magic
Magic word ESP_IMAGE_HEADER_MAGIC

uint8_t segment_count
Count of memory segments

uint8_t spi_mode
flash read mode (esp_image_spi_mode_t as uint8_t)

uint8_t spi_speed
flash frequency (esp_image_spi_freq_t as uint8_t)

uint8_t spi_size
flash chip size (esp_image_flash_size_t as uint8_t)

uint32_t entry_addr
Entry address

uint8_t wp_pin
WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to 0xEE=disabled)

uint8_t spi_pinDrv[3]
Drive settings for the SPI flash pins (read by ROM bootloader)

struct esp_chip_id_t chip_id
Chip identification number

uint8_t min_chip_rev
Minimum chip revision supported by image

uint8_t reserved[8]
Reserved bytes in additional header space, currently unused

uint8_t hash_appended
If 1, a SHA256 digest “simple hash” (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

struct esp_image_segment_header_t
Header of binary image segment.

Public Members

uint32_t load_addr
Address of segment

uint32_t data_len
Length of data

struct esp_app_desc_t
Description about application.

Public Members

uint32_t magic_word
Magic word ESP_APP_DESC_MAGIC_WORD
```c
uint32_t secure_version
    Secure version
uint32_t reserv1[2]
    reserv1
char version[32]
    Application version
char project_name[32]
    Project name
char time[16]
    Compile time
char date[16]
    Compile date
char idf_ver[32]
    Version IDF
uint8_t app_elf_sha256[32]
    sha256 of elf file
uint32_t reserv2[20]
    reserv2
```

**Macros**

```
ESP_IMAGE_HEADER_MAGIC
    The magic word for the esp_image_header_t structure.
ESP_IMAGE_MAX_SEGMENTS
    Max count of segments in the image.
ESP_APP.Desc_MAGIC_WORD
    The magic word for the esp_app_desc structure that is in DROM.
```

**Enumerations**

```c
define esp_chip_id_t
    ESP chip ID.

    Values:

    ESP_CHIP_ID_ESP32 = 0x0000
        chip ID: ESP32
    ESP_CHIP_ID_INVALID = 0xFFFF
        Invalid chip ID (we defined it to make sure the esp_chip_id_t is 2 bytes size)
```

```c
define esp_image_spi_mode_t
    SPI flash mode, used in esp_image_header_t.

    Values:

    ESP_IMAGE_SPI_MODE_QIO
        SPI mode QIO
```
ESP_IMAGE_SPI_MODE_QOUT
SPI mode QOUT

ESP_IMAGE_SPI_MODE_DIO
SPI mode DIO

ESP_IMAGE_SPI_MODE_DOUT
SPI mode DOUT

ESP_IMAGE_SPI_MODE_FAST_READ
SPI mode FAST_READ

ESP_IMAGE_SPI_MODE_SLOW_READ
SPI mode SLOW_READ

enum esp_image_spi_freq_t
SPI flash clock frequency.

Values:

ESP_IMAGE_SPI_SPEED_40M
SPI clock frequency 40 MHz

ESP_IMAGE_SPI_SPEED_26M
SPI clock frequency 26 MHz

ESP_IMAGE_SPI_SPEED_20M
SPI clock frequency 20 MHz

ESP_IMAGE_SPI_SPEED_80M = 0xF
SPI clock frequency 80 MHz

enum esp_image.flash_size_t
Supported SPI flash sizes.

Values:

ESP_IMAGE_FLASH_SIZE_1MB = 0
SPI flash size 1 MB

ESP_IMAGE_FLASH_SIZE_2MB
SPI flash size 2 MB

ESP_IMAGE_FLASH_SIZE_4MB
SPI flash size 4 MB

ESP_IMAGE_FLASH_SIZE_8MB
SPI flash size 8 MB

ESP_IMAGE_FLASH_SIZE_16MB
SPI flash size 16 MB

ESP_IMAGE_FLASH_SIZE_MAX
SPI flash size MAX

2.7.2 Application Level Tracing

Overview

IDF provides useful feature for program behaviour analysis: application level tracing. It is implemented in the corresponding library and can be enabled via menuconfig. This feature allows to transfer arbitrary data between host and ESP32 via JTAG interface with small overhead on program execution. Developers can use this library to send
application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see Application Specific Tracing
2. Lightweight logging to the host, see Logging to Host
3. System behaviour analysis, see System Behavior Analysis with SEGGER SystemView

API Reference

Header File

- app_trace/include/esp_app_trace.h

Functions

decl typeof(esp_err_t) esp_apptrace_init(void)
Initializes application tracing module.

Note Should be called before any esp_apptrace_xxx call.

Return ESP_OK on success, otherwise see esp_err_t

decl void esp_apptrace_down_buffer_config(uint8_t *buf, uint32_t size)
Configures down buffer.

Note Needs to be called before initiating any data transfer using esp_apptrace_buffer_get and esp_apptrace_write. This function does not protect internal data by lock.

Parameters

- buf: Address of buffer to use for down channel (host to target) data.
- size: Size of the buffer.

unsigned int * esp_apptrace_buffer_get(esp_apptrace_dest_t dest, uint32_t size, uint32_t tmo)
Allocates buffer for trace data. After data in buffer are ready to be sent off esp_apptrace_buffer_put must be called to indicate it.

Return non-NULL on success, otherwise NULL.

Parameters

- dest: Indicates HW interface to send data.
- size: Size of data to write to trace buffer.
- tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

decl typeof(esp_err_t) esp_apptrace_buffer_put(esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)
Indicates that the data in buffer are ready to be sent off. This function is a counterpart of and must be proceeded by esp_apptrace_buffer_get.

Return ESP_OK on success, otherwise see esp_err_t

Parameters
• **dest**: Indicates HW interface to send data. Should be identical to the same parameter in call to esp_apptrace_buffer_get.

• **ptr**: Address of trace buffer to release. Should be the value returned by call to esp_apptrace_buffer_get.

• **tmo**: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

```c
esp_err_t esp_apptrace_write(esp_apptrace_dest_t dest, const void *data, uint32_t size, uint32_t tmo)
```

Writes data to trace buffer.

**Return** ESP_OK on success, otherwise see esp_err_t

**Parameters**

• **dest**: Indicates HW interface to send data.

• **data**: Address of data to write to trace buffer.

• **size**: Size of data to write to trace buffer.

• **tmo**: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

```
int esp_apptrace_vprintf_to(esp_apptrace_dest_t dest, uint32_t tmo, const char *fmt, va_list ap)
```

vprintf-like function to sent log messages to host via specified HW interface.

**Return** Number of bytes written.

**Parameters**

• **dest**: Indicates HW interface to send data.

• **tmo**: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

• **fmt**: Address of format string.

• **ap**: List of arguments.

```
int esp_apptrace_vprintf(const char *fmt, va_list ap)
```

vprintf-like function to sent log messages to host.

**Return** Number of bytes written.

**Parameters**

• **fmt**: Address of format string.

• **ap**: List of arguments.

```c
esp_err_t esp_apptrace_flush(esp_apptrace_dest_t dest, uint32_t tmo)
```

Flushes remaining data in trace buffer to host.

**Return** ESP_OK on success, otherwise see esp_err_t

**Parameters**

• **dest**: Indicates HW interface to flush data on.

• **tmo**: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
esp_err_t esp_apptrace_flush_nolock(esp_apptrace_dest_t dest, uint32_t min_sz, uint32_t tmo)

Flushes remaining data in trace buffer to host without locking internal data. This is special version of esp_apptrace_flush which should be called from panic handler.

**Return** ESP_OK on success, otherwise see esp_err_t

**Parameters**
- *dest*: Indicates HW interface to flush data on.
- *min_sz*: Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
- *tmo*: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

esp_err_t esp_apptrace_read(esp_apptrace_dest_t dest, void *data, uint32_t *size, uint32_t tmo)

Reads host data from trace buffer.

**Return** ESP_OK on success, otherwise see esp_err_t

**Parameters**
- *dest*: Indicates HW interface to read the data on.
- *data*: Address of buffer to put data from trace buffer.
- *size*: Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data.
- *tmo*: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

uint8_t *esp_apptrace_down_buffer_get(esp_apptrace_dest_t dest, uint32_t *size, uint32_t tmo)

Retrieves incoming data buffer if any. After data in buffer are processed esp_apptrace_down_buffer_put must be called to indicate it.

**Return** non-NULL on success, otherwise NULL.

**Parameters**
- *dest*: Indicates HW interface to receive data.
- *size*: Address to store size of available data in down buffer. Must be initialized with requested value.
- *tmo*: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

esp_err_t esp_apptrace_down_buffer_put(esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)

Indicates that the data in down buffer are processed. This function is a counterpart of and must be preceeded by esp_apptrace_down_buffer_get.

**Return** ESP_OK on success, otherwise see esp_err_t

**Parameters**
- *dest*: Indicates HW interface to receive data. Should be identical to the same parameter in call to esp_apptrace_down_buffer_get.
- *ptr*: Address of trace buffer to release. Should be the value returned by call to esp_apptrace_down_buffer_get.
- *tmo*: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
bool esp_apptrace_host_is_connected(esp_apptrace_dest_t dest)
Checks whether host is connected.

**Parameters**
- `dest`: Indicates HW interface to use.

void *esp_apptrace_fopen(esp_apptrace_dest_t dest, const char *path, const char *mode)
Opens file on host. This function has the same semantic as ‘fopen’ except for the first argument.

**Return** non zero file handle on success, otherwise 0

**Parameters**
- `dest`: Indicates HW interface to use.
- `path`: Path to file.
- `mode`: Mode string. See fopen for details.

int esp_apptrace_fclose(esp_apptrace_dest_t dest, void *stream)
Closes file on host. This function has the same semantic as ‘fclose’ except for the first argument.

**Return** Zero on success, otherwise non-zero. See fclose for details.

**Parameters**
- `dest`: Indicates HW interface to use.
- `stream`: File handle returned by esp_apptrace_fopen.

size_t esp_apptrace_fwrite (esp_apptrace_dest_t dest, const void *ptr, size_t size, size_t nmemb, void *stream)
Writes to file on host. This function has the same semantic as ‘fwrite’ except for the first argument.

**Return** Number of written items. See fwrite for details.

**Parameters**
- `dest`: Indicates HW interface to use.
- `ptr`: Address of data to write.
- `size`: Size of an item.
- `nmemb`: Number of items to write.
- `stream`: File handle returned by esp_apptrace_fopen.

size_t esp_apptrace_fread (esp_apptrace_dest_t dest, void *ptr, size_t size, size_t nmemb, void *stream)
Read file on host. This function has the same semantic as ‘fread’ except for the first argument.

**Return** Number of read items. See fread for details.

**Parameters**
- `dest`: Indicates HW interface to use.
- `ptr`: Address to store read data.
- `size`: Size of an item.
• `nmemb`: Number of items to read.
• `stream`: File handle returned by `esp_apptrace_fopen`.

```c
int esp_apptrace_fseek(esp_apptrace_dest_t dest, void *stream, long offset, int whence)
```

Set position indicator in file on host. This function has the same semantic as `fseek` except for the first argument.

**Return** Zero on success, otherwise non-zero. See `fseek` for details.

**Parameters**
- `dest`: Indicates HW interface to use.
- `stream`: File handle returned by `esp_apptrace_fopen`.
- `offset`: Offset. See `fseek` for details.

```c
int esp_apptrace_ftell(esp_apptrace_dest_t dest, void *stream)
```

Get current position indicator for file on host. This function has the same semantic as `ftell` except for the first argument.

**Return** Current position in file. See `ftell` for details.

**Parameters**
- `dest`: Indicates HW interface to use.
- `stream`: File handle returned by `esp_apptrace_fopen`.

```c
int esp_apptrace_fstop(esp_apptrace_dest_t dest)
```

Indicates to the host that all file operations are completed. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

**Return** `ESP_OK` on success, otherwise see `esp_err_t`

**Parameters**
- `dest`: Indicates HW interface to use.

```c
void esp_gcov_dump(void)
```

Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

### Enumerations

```c
enum esp_apptrace_dest_t
```  
Application trace data destinations bits.

**Values:**

- `ESP_APPTRACE_DEST_TRAX` = 0x1
  JTAG destination.
- `ESP_APPTRACE_DEST_UART0` = 0x2
  UART destination.
Header File

- app_trace/include/esp_sysview_trace.h

Functions

**static esp_err_t esp_sysview_flush**(uint32_t tmo)
Flushes remaining data in SystemView trace buffer to host.

**Return** ESP_OK.

**Parameters**
- tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

**int esp_sysview_vprintf**(const char *format, va_list args)
vprintf-like function to send log messages to the host.

**Return** Number of bytes written.

**Parameters**
- format: Address of format string.
- args: List of arguments.

**esp_err_t esp_sysview_heap_trace_start**(uint32_t tmo)
Starts SystemView heap tracing.

**Return** ESP_OK on success, ESP_ERR_TIMEOUT if operation has been timed out.

**Parameters**
- tmo: Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

**esp_err_t esp_sysview_heap_trace_stop**(void)
Stops SystemView heap tracing.

**Return** ESP_OK.

**void esp_sysview_heap_trace_alloc**(void *addr, uint32_t size, const void *callers)
Sends heap allocation event to the host.

**Parameters**
- addr: Address of allocated block.
- size: Size of allocated block.
- callers: Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

**void esp_sysview_heap_trace_free**(void *addr, const void *callers)
Sends heap de-allocation event to the host.

**Parameters**
- addr: Address of de-allocated block.
• **callers**: Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

### 2.7.3 eFuse Manager

#### Introduction

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which is assigned in eFuse table. This sections introduces some concepts used by eFuse Manager.

#### Hardware description

The ESP32 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE_BLK0). For more details see ESP32 Technical Reference Manual in part 20 eFuse controller. Some eFuse bits are available for user applications.

ESP32 has 4 eFuse blocks each of the size of 256 bits (not all bits are available):

- **EFUSE_BLK0** is used entirely for system purposes;
- **EFUSE_BLK1** is used for flash encrypt key. If not using that Flash Encryption feature, they can be used for another purpose;
- **EFUSE_BLK2** is used for security boot key. If not using that Secure Boot feature, they can be used for another purpose;
- **EFUSE_BLK3** can be partially reserved for the custom MAC address, or used entirely for user application. Note that some bits are already used in IDF.

Each block is divided into 8 32-bits registers.

#### eFuse Manager component

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool efuse_table_gen.py. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a custom file from the user’s project directory, the utility will check with the common CSV file.

CSV files:

- **common** (esp_efuse_table.csv) - contains eFuse fields which are used inside the IDF. C-source generation should be done manually when changing this file (run command idf.py efuse_common_table). Note that changes in this file can lead to incorrect operation.
- **custom** - (optional and can be enabled by CONFIG_EFUSE_CUSTOM_TABLE) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running idf.py efuse_custom_table.
Description CSV file

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

```
# field_name, efuse_block(0..3), bit_start(0..255), bit_count(1..256), comment
```

Individual params in CSV file the following meanings:

- **field_name** Name of field. The prefix `ESP_EFUSE_` will be added to the name, and this field name will be available in the code. This name will be used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see MAC_FACTORY field in the common table).

- **efuse_block** Block number. It determines where the eFuse bits will be placed for this field. Available EFUSE_BLK0..EFUSE_BLK3.

- **bit_start** Start bit number (0..255). The bit_start field can be omitted. In this case, it will be set to bit_start + bit_count from the previous record, if it has the same efuse_block. Otherwise (if efuse_block is different, or this is the first entry), an error will be generated.

- **bit_count** The number of bits to use in this field (1..256). This parameter can not be omitted. This field also may be MAX_BLK_LEN in this case, the field length will have the maximum block length, taking into account the coding scheme (applicable for ESP_EFUSE_SECURE_BOOT_KEY and ESP_EFUSE_ENCRYPT_FLASH_KEY fields). The value `MAX_BLK_LEN` depends on `CONFIG_EFUSE_MAX_BLK_LEN`, will be replaced with “None” - 256, “3/4” - 192, “REPEAT” - 128.

- **comment** This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, this will indicate that it belongs to one field. For example two fields MAC_FACTORY and MAC_FACTORY_CRC:

```
# Factory MAC address #
########################
MAC_FACTORY,  EFUSE_BLK0,  72,  8, Factory MAC addr [0]
,               EFUSE_BLK0,  64,  8, Factory MAC addr [1]
,               EFUSE_BLK0,  56,  8, Factory MAC addr [2]
,               EFUSE_BLK0,  48,  8, Factory MAC addr [3]
,               EFUSE_BLK0,  40,  8, Factory MAC addr [4]
,               EFUSE_BLK0,  32,  8, Factory MAC addr [5]
MAC_FACTORY_CRC, EFUSE_BLK0,  80,  8, CRC8 for factory MAC address
```

This field will available in code as ESP_EFUSE_MAC_FACTORY and ESP_EFUSE_MAC_FACTORY_CRC.

**efuse_table_gen.py tool**

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional custom file is used, it will be checked with the existing common file (esp_efuse_table.csv). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type `esp_efuse_desc_t`.

To generate a common files, use the following command `idf.py efuse_common_table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32/esp_efuse_table.csv
```
After generation in the folder `esp32` create:

- `esp_efuse_table.c` file.
- In `include` folder `esp_efuse_table.c` file.

To generate a custom files, use the following command `idf.py efuse_custom_table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32.esp_efuse_table.csv PROJECT_PATH/main/esp_efuse_custom_table.csv
```

After generation in the folder `PROJECT_PATH/main` create:

- `esp_efuse_custom_table.c` file.
- In `include` folder `esp_efuse_custom_table.c` file.

To use the generated fields, you need to include two files:

```
#include "esp_efuse.h"
#include "esp_efuse_table.h" or "esp_efuse_custom_table.h"
```

### Support coding scheme

eFuse have three coding schemes:

- None (value 0).
- 3/4 (value 1).
- Repeat (value 2).

The coding scheme affects only EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3 blocks. EUSE_BLK0 block always has a coding scheme None. Coding changes the number of bits that can be written into a block, the block length is constant 256, some of these bits are used for encoding and are not used.

When using a coding scheme, the length of the payload that can be written is limited (for more details see System Parameter coding_scheme):

- None 256 bits.
- 3/4 192 bits.
- Repeat 128 bits.

You can find out the coding scheme of your chip:

- run a `espefuse.py -p COM4 summary` command.
- from `esptool` utility logs (during flashing).
- calling the function in the code `esp_efuse_get_coding_scheme()` for the EFUSE_BLK3 block.

eFuse tables must always comply with the coding scheme in the chip. There is an `EFUSE_CODE_SCHEME_SELECTOR` option to select the coding type for tables in a Kconfig. When generating source files, if your tables do not follow the coding scheme, an error message will be displayed. Adjust the length or offset fields. If your program was compiled with None encoding and 3/4 is used in the chip, then the `ESP_ERR_CODING` error may occur when calling the eFuse API (the field is outside the block boundaries). If the field matches the new block boundaries, then the API will work without errors.

Also, 3/4 coding scheme imposes restrictions on writing bits belonging to one coding unit. The whole block with a length of 256 bits is divided into 4 coding units, and in each coding unit there are 6 bytes of useful data and 2 service bytes. These 2 service bytes contain the checksum of the previous 6 data bytes.
It turns out that only one field can be written into one coding unit. Repeated rewriting in one coding unit is prohibited. But if the record was made in advance or through a `esp_efuse_write_block()` function, then reading the fields belonging to one coding unit is possible.

In case 3/4 coding scheme, the writing process is divided into the coding units and we can not use the usual mode of writing some fields. We can prepare all the data for writing and burn it in one time. You can also use this mode for None coding scheme but it is not necessary. It is important for 3/4 coding scheme. To write some fields in one time need to use the batch writing mode. Firstly set this mode through `esp_efuse_batch_write_begin()` function then write some fields as usual use the `esp_efuse_write_...` functions. At the end to burn they, need to call the `esp_efuse_batch_write_commit()` function. It burns prepared data to the efuse blocks and disable the batch recording mode. The batch writing mode blocks `esp_efuse_read_...` operations.

After changing the coding scheme, run `efuse_common_table` and `efuse_custom_table` commands to check the tables of the new coding scheme.

**eFuse API**

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- `esp_efuse_read_field_blob()` - returns an array of read eFuse bits.
- `esp_efuse_read_field_cnt()` - returns the number of bits programmed as “1”.
- `esp_efuse_write_field_blob()` - writes an array.
- `esp_efuse_write_field_cnt()` - writes a required count of bits as “1”.
- `esp_efuse_get_field_size()` - returns the number of bits by the field name.
- `esp_efuse_read_reg()` - returns value of eFuse register.
- `esp_efuse_write_reg()` - writes value to eFuse register.
- `esp_efuse_get_coding_scheme()` - returns eFuse coding scheme for blocks.
- `esp_efuse_read_block()` - reads key to eFuse block starting at the offset and the required size.
- `esp_efuse_write_block()` - writes key to eFuse block starting at the offset and the required size.
- `esp_efuse_batch_write_begin()` - set the batch mode of writing fields.
- `esp_efuse_batch_write_commit()` - writes all prepared data for batch writing mode and reset the batch writing mode.
- `esp_efuse_batch_write_cancel()` - reset the batch writing mode and prepared data.

For frequently used fields, special functions are made, like this `esp_efuse_get_chip_ver()`, `esp_efuse_get_pkg_ver()`.

**How add a new field**

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py show_efuse_table` or the next command:

```bash
$ ./efuse_table_gen.py esp32/esp_efuse_table.csv --info
```

Used bits in eFuse table:
EFUSE_BLK0
[2 2] [7 9] [16 18] [20 27] [32 87] [96 97] [105 109] [111 111] [136 144] [188 191] [194 194] [196 196] [198 201]

EFUSE_BLK1
[0 255]

EFUSE_BLK2
[0 255]

EFUSE_BLK3
[0 55] [96 159] [184 191]

Note: Not printed ranges are free for using. (bits in EFUSE_BLK0 are reserved for Espressif)
Parsing eFuse CSV input file $IDF_PATH/components/efuse/esp32/esp_efuse_table.csv ...  
Verifying eFuse table...

The number of bits not included in square brackets is free (bits in EFUSE_BLK0 are reserved for Espressif). All fields are checked for overlapping.

2. Fill a line for field: field_name, efuse_block, bit_start, bit_count, comment.

3. Run a `show_efuse_table` command to check eFuse table. To generate source files run `efuse_common_table` or `efuse_custom_table` command.

**Debug eFuse & Unit tests**

**Virtual eFuses**

The Kconfig option `CONFIG_EFUSE_VIRTUAL` will virtualize eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests.

**espefuse.py**

espefuse includes a useful tool for reading/writing ESP32 eFuse bits - `espefuse.py`.

```
$ espefuse.py -p COM4 summary

Config fuses:
- **XPD_SDIO_FORCE**
  - Ignore MTDI pin (GPIO12) for VDD_SDIO on reset
  - Value: 0 (R/W 0x0)
- **XPD_SDIO_REG**
  - If XPD_SDIO_FORCE, enable VDD_SDIO reg on reset
  - Value: 0 (R/W 0x0)
- **XPD_SDIO_TIEH**
  - If XPD_SDIO_FORCE & XPD_SDIO_REG, 1=3.3V 0=1.8V
  - Value: 0 (R/W 0x0)
- **SPI_PAD_CONFIG_CLK**
  - Override SD_CLK pad (GPIO6/SPICLK)
  - Value: 0 (R/W 0x0)
- **SPI_PAD_CONFIG_Q**
  - Override SD_DATA_0 pad (GPIO7/SPIQ)
  - Value: 0 (R/W 0x0)
- **SPI_PAD_CONFIG_D**
  - Override SD_DATA_1 pad (GPIO8/SPID)
  - Value: 0 (R/W 0x0)
- **SPI_PAD_CONFIG_HD**
  - Override SD_DATA_2 pad (GPIO9/SPIHD)
  - Value: 0 (R/W 0x0)
- **SPI_DISABLE_SDIO_HOST**
  - Disable SDIO host
  - Value: 0 (R/W 0x0)

Identity fuses:
- **MAC**
  - MAC Address
  - Value: 84:0d:8e:18:8e:44 (CRC ad OK) R/W
- **CHIP_VER_REV1**
  - Silicon Revision 1
  - Value: 1 (R/W 0x1)
- **CHIP_VERSION**
  - Reserved for future chip versions
  - Value: 2 (R/W 0x2)
- **CHIP_PACKAGE**
  - Chip package identifier
  - Value: 0 (R/W 0x0)

Calibration fuses:
- **BLK3_PART_RESERVE**
  - BLOCK3 partially served for ADC calibration data
  - Value: 1 (R/W 0x1)
- **ADC_VREF**
  - Voltage reference calibration
  - Value: 1114 (R/W)
- **ADC1_TP_LOW**
  - ADC1 150mV reading
  - Value: 346 (R/W)
- **ADC1_TP_HIGH**
  - ADC1 850mV reading
  - Value: 3285 (R/W)
- **ADC2_TP_LOW**
  - ADC2 150mV reading
  - Value: 449 (R/W)
- **ADC2_TP_HIGH**
  - ADC2 850mV reading
  - Value: 3362 (R/W)

Flash voltage (VDD_SDIO) determined by GPIO12 on reset (High for 1.8V, Low/NC for 3.3V).

To get a dump for all eFuse registers:

```bash
esefuse.py -p COM4 dump
$ esefuse.py -p COM4 dump
esefuse.py v2.3.1

**Header File**

- `efuse/include/esp_efuse.h`
Functions

```c
esp_err_t esp_efuse_read_field_blob(const esp_efuse_desc_t *field[], void *dst, size_t dst_size_bits)
```
Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in “field” structure or “dst_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field.

Return

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

Parameters

- `field`: A pointer to the structure describing the fields of efuse.
- `dst`: A pointer to array that will contain the result of reading.
- `dst_size_bits`: The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

```c
esp_err_t esp_efuse_read_field_cnt(const esp_efuse_desc_t *field[], size_t *out_cnt)
```
Reads bits from EFUSE field and returns number of bits programmed as “1”.

If the bits are set not sequentially, they will still be counted.

Return

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

Parameters

- `field`: A pointer to the structure describing the fields of efuse.
- `out_cnt`: A pointer that will contain the number of programmed as “1” bits.

```c
esp_err_t esp_efuse_write_field_blob(const esp_efuse_desc_t *field[], const void *src, size_t src_size_bits)
```
Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in “field” structure or “src_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field. After the function is completed, the writing registers are cleared.

Return

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

Parameters

- `field`: A pointer to the structure describing the fields of efuse.
- `src`: A pointer to array that contains the data for writing.
- `src_size_bits`: The number of bits required to write.
esp_err_t esp_efuse_write_field_cnt(const esp_efuse_desc_t *field[], size_t cnt)
  Writes a required count of bits as “1” to EFUSE field.
  
  If there are no free bits in the field to set the required number of bits to “1”, ESP_ERR_EFUSE_CNT_IS_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

  Return
  • ESP_OK: The operation was successfully completed.
  • ESP_ERR_INVALID_ARG: Error in the passed arguments.
  • ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

Parameters
  • field: A pointer to the structure describing the fields of efuse.
  • cnt: Required number of programmed as “1” bits.

esp_err_t esp_efuse_set_write_protect(esp_efuse_block_t blk)
  Sets a write protection for the whole block.
  
  After that, it is impossible to write to this block. The write protection does not apply to block 0.

  Return
  • ESP_OK: The operation was successfully completed.
  • ESP_ERR_INVALID_ARG: Error in the passed arguments.
  • ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
  • ESP_ERR_NOT_SUPPORTED: The block does not support this command.

Parameters
  • blk: Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

esp_err_t esp_efuse_set_read_protect(esp_efuse_block_t blk)
  Sets a read protection for the whole block.
  
  After that, it is impossible to read from this block. The read protection does not apply to block 0.

  Return
  • ESP_OK: The operation was successfully completed.
  • ESP_ERR_INVALID_ARG: Error in the passed arguments.
  • ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
  • ESP_ERR_NOT_SUPPORTED: The block does not support this command.

Parameters
  • blk: Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

int esp_efuse_get_field_size(const esp_efuse_desc_t *field[])
  Returns the number of bits used by field.

  Return Returns the number of bits used by field.

Parameters
  • field: A pointer to the structure describing the fields of efuse.
uint32_t esp_efuse_read_reg (esp_efuse_block_t blk, unsigned int num_reg)
    Returns value of efuse register.
    This is a thread-safe implementation. Example: EFUSE_BLK2_RDATA3_REG where (blk=2, num_reg=3)

    Return Value of register

    Parameters
    • blk: Block number of eFuse.
    • num_reg: The register number in the block.

esp_err_t esp_efuse_write_reg (esp_efuse_block_t blk, unsigned int num_reg, uint32_t val)
    Write value to efuse register.
    Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE_BLK3_WDATA0_REG where (blk=3, num_reg=0)

    Return
    • ESP_OK: The operation was successfully completed.
    • ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.

    Parameters
    • blk: Block number of eFuse.
    • num_reg: The register number in the block.
    • val: Value to write.

esp_efuse_coding_scheme_t esp_efuse_get_coding_scheme (esp_efuse_block_t blk)
    Return efuse coding scheme for blocks.
    Note: The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

    Return Return efuse coding scheme for blocks

    Parameters
    • blk: Block number of eFuse.

esp_err_t esp_efuse_read_block (esp_efuse_block_t blk, void *dst_key, size_t offset_in_bits, size_t size_bits)
    Read key to efuse block starting at the offset and the required size.

    Return
    • ESP_OK: The operation was successfully completed.
    • ESP_ERR_INVALID_ARG: Error in the passed arguments.
    • ESP_ERR_CODING: Error range of data does not match the coding scheme.

    Parameters
    • blk: Block number of eFuse.
    • dst_key: A pointer to array that will contain the result of reading.
    • offset_in_bits: Start bit in block.
    • size_bits: The number of bits required to read.
esp_err_t esp_efuse_write_block(esp_efuse_block_t blk, const void *src_key, size_t offset_in_bits, size_t size_bits)
Write key to efuse block starting at the offset and the required size.

Return

• ESP_OK: The operation was successfully completed.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_CODING: Error range of data does not match the coding scheme.
• ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits

Parameters

• blk: Block number of eFuse.
• src_key: A pointer to array that contains the key for writing.
• offset_in_bits: Start bit in block.
• size_bits: The number of bits required to write.

uint8_t esp_efuse_get_chip_ver(void)
Returns chip version from efuse.

Return chip version

uint32_t esp_efuse_get_pkg_ver(void)
Returns chip package from efuse.

Return chip package

void esp_efuse_burn_new_values(void)
void esp_efuse_reset(void)
void esp_efuse_disable_basic_rom_console(void)
void esp_efuse_write_random_key(uint32_t blk_wdata0_reg)
uint32_t esp_efuse_read_secure_version(void)
bool esp_efuse_check_secure_version(uint32_t secure_version)

esp_err_t esp_efuse_update_secure_version(uint32_t secure_version)
void esp_efuse_init(uint32_t offset, uint32_t size)

esp_err_t esp_efuse_batch_write_begin(void)
esp_err_t esp_efuse_batch_write_cancel(void)

esp_err_t esp_efuse_batch_write_commit(void)

Structures

struct esp_efuse_desc_t
Structure eFuse field.
Public Members

```c
esp_efuse_block_t efuse_block
        Block of eFuse
uint8_t bit_start
        Start bit [0..255]
uint16_t bit_count
        Length of bit field [1..-]
```

Macros

```c
ESP_ERR_EFUSE
        Base error code for efuse api.
ESP_OK_EFUSE_CNT
        OK the required number of bits is set.
ESP_ERR_EFUSE_CNT_IS_FULL
        Error field is full.
ESP_ERR_EFUSE_REPEATED_PROG
        Error repeated programming of programmed bits is strictly forbidden.
ESP_ERR_CODING
        Error while a encoding operation.
```

2.7.4 Error Codes and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling.
For general information about error codes in ESP-IDF, see Error Handling.
For the full list of error codes defined in ESP-IDF, see Error Code Reference.

API Reference

Header File

- esp_common/include/esp_err.h

Functions

```c
const char *esp_err_to_name(esp_err_t code)
        Returns string for esp_err_t error codes.
```

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

Return string error message

Parameters
• code: esp_err_t error code

**const char **esp_err_to_name_r (esp_err_t code, char *buf, size_t buflen)

Returns string for esp_err_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp_err_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

**Return** buf containing the string error message

**Parameters**

• code: esp_err_t error code

• buf: buffer where the error message should be written

• buflen: Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

**Macros**

ESP_OK
   esp_err_t value indicating success (no error)

ESP_FAIL
   Generic esp_err_t code indicating failure

ESP_ERR_NO_MEM
   Out of memory

ESP_ERR_INVALID_ARG
   Invalid argument

ESP_ERR_INVALID_STATE
   Invalid state

ESP_ERR_INVALID_SIZE
   Invalid size

ESP_ERR_NOT_FOUND
   Requested resource not found

ESP_ERR_NOT_SUPPORTED
   Operation or feature not supported

ESP_ERR_TIMEOUT
   Operation timed out

ESP_ERR_INVALID_RESPONSE
   Received response was invalid

ESP_ERR_INVALID_CRC
   CRC or checksum was invalid

ESP_ERR_INVALID_VERSION
   Version was invalid

ESP_ERR_INVALID_MAC
   MAC address was invalid
ESP_ERR_WIFI_BASE
Starting number of WiFi error codes

ESP_ERR_MESH_BASE
Starting number of MESH error codes

ESP_ERR_FLASH_BASE
Starting number of flash error codes

ESP_ERROR_CHECK(x)
Macro which can be used to check the error code, and terminate the program in case the code is not ESP_OK.
Prints the error code, error location, and the failed statement to serial output.
Disabled if assertions are disabled.

ESP_ERROR_CHECK_WITHOUT_ABORT(x)
Macro which can be used to check the error code. Prints the error code, error location, and the failed statement
to serial output. In comparison with ESP_ERROR_CHECK(), this prints the same error message but isn’t
terminating the program.

Type Definitions

typedef int32_t esp_err_t

2.7.5 ESP HTTPS OTA

Overview

esp_https_ota provides simplified APIs to perform firmware upgrades over HTTPS. It’s an abstraction layer over
existing OTA APIs.

Application Example

def do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_err_t ret = esp_https_ota(&config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}

Signature Verification

For additional security, signature of OTA firmware images can be verified. For that, refer Secure OTA Updates Without
Secure boot
API Reference

Header File

- esp_https_ota/include/esp_https_ota.h

Functions

`esp_err_t esp_https_ota(const esp_http_client_config_t *config)`

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert.pem` member of `config`.

**Note** This API handles the entire OTA operation, so if this API is being used then no other APIs from `esp_https_ota` component should be called. If more information and control is needed during the HTTPS OTA process, then one can use `esp_https_ota_begin` and subsequent APIs. If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image.

**Return**

- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

**Parameters**

- `config`: pointer to `esp_http_client_config_t` structure.

`esp_err_t esp_https_ota_begin(esp_https_ota_config_t *ota_config, esp_https_ota_handle_t *handle)`

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then `esp_https_ota_perform` should be called to continue with the OTA process and there should be a call to `esp_https_ota_finish` on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert.pem` member of `http_config`, which is a part of `ota_config`. In case of error, this API explicitly sets `handle` to NULL.

**Note** This API is blocking, so setting `is_async` member of `http_config` structure will result in an error.

**Return**

- ESP_OK: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument (missing/incorrect config, certificate, etc.)
• For other return codes, refer documentation in app_update component and esp_http_client component in esp-idf.

Parameters

• ota_config: pointer to esphlsota_config_t structure
• handle: pointer to an allocated data of type esp_https_ota_handle_t which will be initialised in this function

\texttt{esp_err_t esp_https_ota_perform} (\texttt{esp_https_ota_handle_t https_ota_handle})

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if esp_https_ota_begin() returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

Return

• ESP_ERR_HTTPS_OTA_IN_PROGRESS: OTA update is in progress, call this API again to continue.
• ESP_OK: OTA update was successful
• ESP_FAIL: OTA update failed
• ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
• ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
• ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
• For other return codes, refer OTA documentation in esp-idf’s app_update component.

Parameters

• https_ota_handle: pointer to esp_https_ota_handle_t structure

\texttt{bool esp_https_ota_is_complete_data_received} (\texttt{esp_https_ota_handle_t https_ota_handle})

Checks if complete data was received or not.

\textbf{Note} This API can be called just before esp_https_ota_finish() to validate if the complete image was indeed received.

Return

• false
• true

Parameters

• https_ota_handle: pointer to esp_https_ota_handle_t structure

\texttt{esp_err_t esp_https_ota_finish} (\texttt{esp_https_ota_handle_t https_ota_handle})

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

\textbf{Note} If this API returns successfully, esp_restart() must be called to boot from the new firmware image

\textbf{Return}
• ESP_OK: Clean-up successful
• ESP_ERR_INVALID_STATE
• ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image

Parameters

• https_ota_handle: pointer to esp_https_ota_handle_t structure

Esp_err_t esp_https_ota_get_img_desc(esp_https_ota_handle_t https_ota_handle, esp_app_desc_t *new_app_info)

Reads app description from image header. The app description provides information like the “Firmware version” of the image.

Note  This API can be called only after esp_https_ota_begin() and before esp_https_ota_perform(). Calling this API is not mandatory.

Return

• ESP_ERR_INVALID_ARG: Invalid arguments
• ESP_FAIL: Failed to read image descriptor
• ESP_OK: Successfully read image descriptor

Parameters

• https_ota_handle: pointer to esp_https_ota_handle_t structure
• new_app_info: pointer to an allocated esp_app_desc_t structure

Int esp_https_ota_get_image_len_read(esp_https_ota_handle_t https_ota_handle)

Structures

struct esp_https_ota_config_t
ESP HTTPS OTA configuration.

Public Members

const esp_http_client_config_t *http_config
ESP HTTP client configuration

Macros

ESP_ERR_HTTPS_OTA_BASE
ESP_ERR_HTTPS_OTA_IN_PROGRESS

Type Definitions

typedef void *esp_https_ota_handle_t
2.7.6 ESP-pthread

Overview

This module offers Espressif specific extensions to the pthread library that can be used to influence the behavior of pthreads. Currently the following configurations can be tuned:

- Stack size of the pthreads
- Priority of the created pthreads
- Inheriting this configuration across threads
- Thread name
- Core affinity / core pinning.

Example to tune the stack size of the pthread:

```c
void * thread_func(void * p)
{
    printf("In thread_func\n");
    return NULL;
}

void app_main(void)
{
    pthread_t t1;
